MR. HUMBERT, of Watford, Herts, a practical Surveyor and Land-Agent of more than 15 years' standing, offers his services to Gentlemen about to drain Land and Bogs. He will undertake to set out and superintend himself the execution of the work at a charge of 5*s.* per acre, and the expenses incurred in his travelling; or he will contract to complete it in a specified manner to the satisfaction of the Inclosure Commissioners at a fixed price per acre. Mr. Humbert has drained strong stony land in the most careful and complete manner, with 1¾ inch pipes, and proper mains, the drains being 4 feet deep and 30 feet apart, at 4*l.* per acre and under, and he can give reference to his employers in that and in other instances.

Watford, Herts, Sept. 1.

THE GENERAL LAND DRAINAGE AND IMPROVEMENT COMPANY

INCORPORATED BY SPECIAL ACT OF PARLIAMENT.

Offices, 52, Parliament Street, London.

DIRECTORS.

HENRY KER SEYMER, Esq., M.P., *Chairman.*

SIR JOHN V. SHELLEY, Bart., M.P., *Deputy-Chairman.*

George Thomas Clark, Esq.	William Fisher Hobbs, Esq.
John C. Cobbold, Esq., M.P.	Edward J. Hutchins, Esq., M.P.
Sir William Cubitt, F.R.S.	Sir S. M. Peto, Bart.
Henry Currie, Esq.	William Tite, Esq., F.R.S.
Thomas Edward Dicey, Esq.	William Wilshere, Esq.

Empowered to execute Drainage, Road-making, and other Land Improvements, and to Erect Farm Buildings upon Estates under Settlement, Mortgage, or otherwise; or Church property, and without investigation of Title to charge the whole outlay and expenses upon the Estate, to be repaid by instalments spread over any period determined by Landowners within the limits of 50 years for Drainage and Roads, and 31 years for Farm Buildings.

Landowners may arrange with the Company for the execution of the works by their own agents, with the use of their own or the Company's Capital. WILLIAM CLIFFORD, Sec.

THE LANDS IMPROVEMENT COMPANY.—Incorporated by Act of Parliament, 1852—53, for England and Scotland, and further empowered by Amendment Act, 1854—55. To Landowners, the Clergy, Solicitors, Estate Agents, Surveyors, &c., Tenants for Life, Trustees, Owners in Fee, Incumbents of Livings, Bodies Corporate; Lessees for Lives renewable, or for a term of more than 25 years; (and Lessees for Lives not renewable, or for a term less than 25 years, with consent of their Lessor), &c., are enabled, by way of Loan from the Company, or by their own funds, to execute and charge on the Lands improved, by way of rent-charge for a term of 25 years, repaying capital and interest, the cost of every landed improvement, especially of Drainage, Irrigation, Warping, Embanking from the Sea, from Lakes, Rivers, or Streams, Inclosing any Land, or improving Drains, Streams, or Water-courses, Reclamation, Farm Roads, Clearing, Erection of Farm-houses and other Buildings required for farm purposes, and the Improvement of and Additions to Farm Houses, and other Buildings for Farm purposes already erected; Planting for Shelter and for Periodical Cuttings, Jetties or Landing Places on the Sea Coast or on the banks of navigable Rivers or Lakes in the Highlands and Islands of Scotland; Engines and Machinery for Drainage, Engine-houses for Farm Steadings, &c., Water-wheels, Tanks, Pipes, Water-courses, Bridges, Sluices, &c. The Plans of Buildings, Specifications and estimates are prepared by the Applicant's own Agents and are submitted to the approval of the Inclosure Commissioners' Inspectors who are also the sole judges of the due execution of the works. Proprietors may apply jointly for the execution of Improvements mutually beneficial,—such as a common Outfall—Roads through the District—Water power, &c. The Directors wish it to be understood that the Company is of a strictly commercial character, and that the details of the Plans and of the execution of the Works are not interfered with by them, but are controlled by the Landowner and by the Inclosure Commissioners. For further information and for Forms of Application, apply to the Honourable WILLIAM NAPIER, Managing Director, 2, Old Palace Yard, Westminster.

WATERPROOF PATHS.

BARN AND CATTLE SHED FLOORS.

THOSE who would enjoy their Gardens during the winter months should construct their walks of PORTLAND CEMENT CONCRETE, which are formed thus:—Screen the gravel of which the path is at present made from the loam which is mixed with it, and to every part of clean gravel add one of sharp river sand. To five parts of such equal mixture add one of Portland Cement, and incorporate the whole well in the dry state before applying the water. It may then be laid on 2 inches thick. Any labourer can mix and spread it. No tool is required beyond the spade, and in 48 hours it becomes as hard as a rock. Vegetation cannot grow through or upon it, and it resists the action of the severest frost. It is necessary, as water does not soak through it, to give a fall from the middle of the path towards the sides.

The same preparation makes first-rate paving for BARNS, CATTLE-SHEDS, FARM-YARDS, and all other situations where a clean, hard bottom is a desideratum. May be laid in winter equally well as in summer.

Manufacturers of the Cement, J. B WHITE & BROTHERS, Milbank Street, Westminster.

DO YOU BRUISE YOUR OATS YET?—One bushel of Oats when Crushed will make two. Great saving. OAT BRUISERS, Chaff-cutters, Ploughs, Threshing Machines, Flour Mill Carts, Corn Dressing do., Horse and Steam Machinery put up, &c. Book on Feeding, 1*s.*

M. WEDLAKE, 118, Fenchurch Street, London.

WARNER'S 4½-inch IMPROVED LIQUID MANURE PUMP, with Ball Valve, fitted with 1½ inch Brass Union for attaching flexible suction, with strong wrought iron Straps for screwing on to any ordinary Water-butt or Cart, as shown in drawing.

Price of Pump and Union, 50*s.*

1½-inch Flexible Rubber and Canvas Suction for ditto, 3*s.* 6*d.* per foot.

1½ Gutta Percha Suction, 1*s.* 6*d.* per foot.

WARNER'S IMPROVED LIQUID MANURE OR GENERAL PORTABLE PUMP.

The valve is a ball of imperishable material, and cannot clog in action. The barrel is of galvanised iron, not likely to corrode, and can be raised or lowered at pleasure. The legs will fold together, and the whole may be carried on shoulder to any pond or tank required.

Price of 4½ in. Pump, with legs, 3*l.* 3*s.* The barrel is 27½ in. long, and the legs are 5 ft. high.

1½ inch Gutta Percha Suction Pipe, 1*s.* 6*d.* per foot.

1½ inch Flexible Rubber and Canvas Suction Pipe, 3*s.* 6*d.* per foot.

May be obtained of any Ironmonger or Plumber in town or country, at the above prices, or of the Patentees and Manufacturers, JOHN WARNER & SONS, 8, Crescent, Jewin Street, London.

Every description of Machinery for Raising Water, by means of Wheels, Rams, Deep Well Pumps, &c.; also Fire and Garden Engines, &c.—Engravings sent on application.

WARNER'S PATENT VIBRATING STANDARD PUMPS.

PATENT CAST-IRON PUMPS, for the use of Farms, Cottages, Manure Tanks, and Wells of a depth not exceeding 30 feet.

Diameter of Barrel	Length of Barrel, under nose.		£	s.	d.
2½ in.	short 1 ft. 7 in.	Fitted for lead, gutta percha, or cast iron flanged pipe, as required.	1	12	0
2½ „	long 3 „ 3 „		1	15	0
3 „	ditto 3 „ 6 „		2	12	0
3½ „	ditto 3 „ 6 „		2	18	0
4 „	ditto 3 „ 6 „		3	5	0
2½ „	short, with 15 feet of Lead Pipe attached, and Bolts and Nuts ready for fixing		2	12	0
2½ in.	long ditto	ditto ditto	2	15	0

The short barrel Pump is very convenient for fixing in situations of limited height and space, for the supply of coppers and sinks in Wash-houses with soft water from underground tanks, or in Hot, Forcing, and Plant Houses; they may be fixed, when desired, under the stage.

May be obtained of any Ironmonger or Plumber in Town or Country, at the above prices, or of the Patentees and Manufacturers, JOHN WARNER AND SONS, 8, Crescent, Jewin Street, London.

Every description of Machinery for Raising Water, by means of Wheels, Rams, Deep Well Pumps, &c.; also Fire and Garden Engines, &c. &c.—Engravings sent on application.

ROYAL AGRICULTURAL SOCIETY OF ENGLAND.

AT THE NORWICH, GLOUCESTER, LINCOLN, and CARLISLE SHOWS,

The Prize for the best LINSEED and CORN CRUSHER was awarded to E. R. & F. TURNER, St. Peter's Iron Works, Ipswich.

E. R. & F. TURNER invite the attention of Agriculturists and others to the following machines of their manufacture:—

ROLLER MILLS for Crushing Linseed, Oats, Barley, Malt, &c., of various sizes, with or without Bean-mill combined. The numerous prizes awarded these Mills by the Royal and other agricultural societies, render comment on their merits unnecessary.

PATENT COMBINED GRINDING and CRUSHING MILL for reducing Barley, &c., to a fine and soft meal, and crushing Oats, Linseed, &c., is strongly recommended for the variety of purposes to which it is applicable, and for its perfect and economic working. Price 25*l.*

CHAFF CUTTERS, for horse or steam power, cutting three lengths, with facility for changing the length of the cut almost momentarily, and other valuable improvements.

OILCAKE BREAKERS, made entirely of iron, with case, hardened teeth suitable for all descriptions of cake. Price 8*l.* 10*s.*

FIXED STEAM-ENGINES, on the horizontal direct acting principle. Long experience and attention to the practical working of steam-engines of every variety, have enabled the manufacturers to offer these Engines as inferior to none—either for efficiency, economy, or durability—and at prices which will be found comparatively low.

Superior Portable Steam-Engines and Threshing Machines, Horse-Power Threshing Machines, Circular Saw Tables, One Horse Carts, and various other Implements, are also manufactured at the above Works.

Illustrated Price Lists sent free on application

CAUTION.

PARKES' STEEL DIGGING FORKS AND DRAINING TOOLS.

Whereas very inferior descriptions of Steel Digging Forks are now manufactured and sold, and I have been informed that purchasers of the same have believed them to be the same as those manufactured by me, and to which the Royal Agricultural Society and numerous Agricultural Societies' prizes have been awarded, I hereby respectfully inform the public that every Fork manufactured by me is stamped with my trade mark "J. P.," and that Messrs. BURGESS & KEY, of No. 103, Newgate Street, London, are my sole Wholesale Agents, and I have authorised them to replace to the purchaser every Fork of my manufacture found defective; they will also on application send Wholesale and Retail Price Lists, &c., post free. FRANCIS PARKES & Co.

PAXTON WORKS, SHEFFIELD.

SAYNOR AND COOKE, Manufacturers of the celebrated Exhibition Prize PRUNING, BUDDING, and GRAFTING KNIVES, VINE and PRUNING SCISSORS, &c. These articles are Warranted to stand any kind of work, and to carry the keen edge of a razor without requiring to be sharpened so frequently as is usually necessary to obtain that sharp edge so requisite for the comfort and use of the practical gardener. The blades are also warranted to wear through to the back. They are used by all the eminent gardeners in England, Ireland, and Scotland, and can be purchased of any nurseryman or seedsman in the three kingdoms. Those who may not have used them are respectfully solicited to give them a trial. The Great Exhibition Prize Medal of 1851, and the Prize Medal of the Horticultural Society of Manchester, at their Show of 1854, was awarded to SAYNOR & COOKE for their superiority of material and workmanship. Established 1738.

CLAYTON, SHUTTLEWORTH, & CO.'S PRIZE PORTABLE STEAM ENGINES, AND COMBINED THRESHING, STRAW SHAKING, RIDDLING AND WINNOWING MACHINE may be seen at their London Establishment, 6, Fitzroy Terrace, New Road, where all information relative thereto can be obtained. These Machines are constructed to horn Barley, and make a perfect separation of the chaff from the pulse. They are fitted with Elevators, which deposit the grain into bags, and beyond the feeder of Machine require no hands except to take away the Corn, &c., as threshed, the whole of the operations being performed by self-acting machinery, whereby the Corn, Straw, Chaff, and Pulse are delivered in the places assigned for them.

C. S. & Co. have paid special attention to this class of Machinery, and Fixed Barn Machinery, and from the position they have taken at the Royal and all the leading Agricultural Shows of England, flatter themselves that for efficiency, durability, and simplicity, their Engines and Machines are not surpassed by any other maker in England. All letters forwarded to the Works at Lincoln will have immediate attention; and Illustrated Catalogues forwarded to all parts of the kingdom postage free.

IRON GATES, HURDLES, FENCING, ETC.

J. BULLOCK AND CO., Hope Iron Works, Primrose Street, Bishopsgate, Ironfounders and manufacturers of the above; also Verandahs, Conservatories, Staircases, Iron Roofs, &c. N.B. Iron and Wire Fences fixed in all parts of the country by competent workmen, or the materials supplied painted or galvanised ready for fixing, and packed for shipment. Estimates on applicaion.

The Agricultural Gazette.

SATURDAY, SEPTEMBER 1, 1855.

WE last year referred to a remarkable sample of Wheat in the ear sent to us by General ARBUTHNOT from Northamptonshire. We have just received from the same land samples of the same Wheat—Bristol Red—which then proved so productive, along with specimens of two other varieties—Viper Red and Tiny's Success. The first-named variety has not so perfectly developed its wonderful productiveness in the ears sent to us as it did last year, but the sort called Tiny's Success is certainly one of the most remarkable samples we have ever seen. The ears carry 20 to 24 spikelets, arranged at rather large intervals, so that the whole spike is of remarkable length, and the spikelets carrying from three to five fruitful florets, we have on each stalk upwards of 80 well-formed grains.

Mr. THOMPSON did well to point out at the meeting of the Yorkshire Agricultural Society that the difference between a good and a poor crop lay more generally in the number of grains yielded by each ear than in the number of ears standing on a given extent of ground, and it becomes therefore of the highest importance to choose sorts like the Bristol Red and Tiny's Success—such as possess originally the germs of the largest number of parts which intelligent management during the growth of the plant is able to feed and mature.

General ARBUTHNOT has grown this year 128 acres of Wheat, and on no former occasion, he tells us, have the crops been so fine. Tiny's Success was grown in a field much exposed to the north and west, and although in its immediate vicinity whole fields are beaten down, this field may be called an exception, scarcely any being laid. Many persons have been to see it, and rarely has a field of 26 acres presented a more uniform fine appearance.

We add, in reference to the crops generally throughout the country, that they have everywhere benefited by the magnificent harvest weather we are enjoying, and the quality and yield of grain will no doubt exceed the estimate which a few weeks ago had been formed of it. As an illustration of this, we insert the following, received just as we are going to press, from Mr. EDWARDS, of Framlingham, Suffolk:—

Sir,—In my return of expectations as to the crops, written before harvest, I stated the Wheat to be "various, under average." I went from this place to Bury St. Edmund's yesterday, and must report the

Wheat crop in High Suffolk to be very good indeed. My own cuts up very good, far better than I had any idea of.

Since our remarks were published on the chlorotised Oats received from Lancashire, our correspondent has kindly forwarded additional examples, with the promise of ripe seed on some future opportunity. He confirms our conjecture that the original evil was in the seed, inasmuch as the ridges in the very same field, which grew from some of his own seed, are quite free from disease; and a further proof is afforded by the fact that in two distant fields of very different texture, and at a considerable distance, the crop is similarly affected. We shall hope to make an experiment with the seed of some of the diseased plants next year, in order to ascertain positively whether the affection is capable of being propagated by sowing. Should this notion be confirmed, there will be increased ground for carefulness in the selection of seed, either from ocular inspection of the crop when growing, or from confidence in the character of the party from whom it is purchased. *M. J. B.*

In further considering the causes of Fertility and Barrenness in Soils, we come to the second division of the subject, which relates to what science has ascertained upon the subject. And in the outset we may remark that *its* teachings, too, are the result of observation. It is too much the custom among farmers to regard science as synonymous with mere speculation and theory, than which nothing can be more unjust to scientific men. Science is just classified experience—the results of observation arranged, or rather the truth which those results when so ordered illustrate and exhibit. That which is true in any particular case becomes *a truth* when in a multitude of cases it has been observed, and scientific truth may certainly be depended on so much the more for the wide basis of observed facts on which it rests. When the chemist states that phosphoric acid and ammonia are essential to the fertility of a soil, it is no mere fancy that he is teaching; but a truth which he has laboriously ascertained by the chemical examination of a multitude of natural soils, and the agricultural trial of many artificial ones. And so, with every other truth in agricultural chemistry, and in the geology and botany of agriculture—in its mechanics too—men who are acquainted with these several sciences may be trusted by the farmer as teaching *facts*, when announcing scientific truth. If they go beyond this, and recommend a course of practice in the field because it appears to them to be founded upon this truth, then indeed they may be criticised and doubted. The truth they teach, no doubt, will ultimately influence practice; but *they* may not know how to make it influential: all they have to do is to teach it independently, and let cultivators find out how to use it. Farmers will turn it to a profit ultimately; but this, in order to be safe, must be a work of time, and in the commencement of the process it is a wise determination to attack the giant *difficulty* with the usual sling and stone, rather than trust to weapons that have not been proved. Just as certainly, however, as "sling and stone" have disappeared before the exhibition of better modes and instruments of warfare, must former practice yield where it is faulty before those truths which chemists teach, and which must make themselves felt whether in the inert soil or in the living plant and animal.

Perhaps the best way of communicating what science teaches in reference to fertility in soils is to consider (1), plants as beings needing food under particular circumstances as to temperature and moisture; and (2), soils as a combination of laboratory, warehouse, and machine, by means of which this food is manufactured, stored, and administered. It is the latter division of the subject especially that we wish to discuss. Fertility depends, according to this illustration of it, upon the ability of a soil to manufacture, store, and administer food for plants, and to these points respectively we shall in future articles address ourselves.

LOIS WEEDON WHEAT GROWING.

To the Editor of the Agricultural Gazette.

Dear Sir,—I very willingly comply with your request for a report "with especial reference to the standing of my Wheat crops and the brightness of the straw."

That on the four acre gravel piece, carried on the 18th, was excellent, the straw perfectly bright and upstanding, with a slight bend from the weight of the ears from west to east; and you will judge of the quality of the Wheat from the accompanying sample of Lammas and Bristol red.

The crop on the home piece of clay land, carried to-day, was the best and heaviest I have ever had, standing so thick that it shut out the intervals, and seemed to cover the whole land; not at all down, with the exception of a few yards, which did not touch the ground, and the straw quite bright. The ears I send for your inspection are a very fair specimen of the whole; and they are so bulky and well filled that I think you will agree with me and many others that we are not far wrong in estimating the yield at 6 quarters.

A report like this, without an ulterior object, would be valueless and obtrusive. But I conceive there are circumstances connected with these results which are generally interesting and conclusive as to more than one point in this theory of growing Wheat.

The leading point in this theory is, that if with a deepened and pulverised fallow interval a due supply of mineral food be provided for the Wheat plant, the atmosphere will abundantly provide the organic portion; and that clays and loams generally, though not universally, do afford this requisite mineral supply.

The safe theory, further, is, that on soils which do not contain all or any of the mineral constituents of the Wheat plant, every such deficiency must be supplied from without.

When these conditions are fulfilled, the experience of many years has taught me that, for this plan of growing Wheat, land cannot be too much exhausted of its organic elements of fertility; exhausted, that is, of previous manuring, or of that which—so to speak—naturally exists in the soil from the decay of animal or vegetable matter.

And now to the proof. I have said that the crop on the clay land was the best and heaviest I have ever had—I may even add that it was the best crop of Wheat I ever saw anywhere. And yet it was the tenth crop in succession on a great portion on the same acre of land, that original portion being the best of the whole. Why was it the best crop? Simply because the land (referring to the original piece) was comparatively exhausted in the sense I spoke of before. And if the proof be required, not from mere reasoning, but from fact, it is here: The fresh portion of this piece of land had been manured for a root crop two years ago, and—on an after thought—was added at that time to the original piece and sown with Wheat; and all that fresh portion was fearfully blighted last year, and the original portion was comparatively clean. Comparatively clean, for, as a further confirmation of the fact, out of the triple rows the two outer lines which had readier access into the intervals were damaged, while each middle row was sound. That the original piece was blighted at all was owing to the sort of Wheat grown (Payne's bearded Wheat) which is unsuited to this deep mode of cultivation on clays and heavy loams.

With regard to this year's crop on the clay, the line was distinctly marked to a foot between the old portion and the new, the former being bright as fine gold, while the latter was late and discoloured, and only saved from mildew by the extraordinary season.

The 4-acre piece of light gravelly loam is thoroughly exhausted of organic food, having now borne five crops in succession after Wheat in the ordinary four-course rotation. Finding it deficient also in a due supply of mineral ingredients for the Wheat, a portion of it before the last sowing was dressed with clay. On the portion not dressed with clay, the crop was weak, and that portion of the field I am now supplying with mineral food by similar means.

As a proof that a due supply of mineral substances was wanting in that portion, and that mineral food alone was required, I must here state that the field being foul with a century's filth, I pared the stubble before sowing and burnt it together with the weeds on that particular portion; and wherever the heaps were burnt, necessarily leaving on those spots more ashes than were spread elsewhere, there the crop was the heaviest and highest by 6 or 8 inches.

As a proof that exhausted land is best suited to this plan of growing Wheat, being a security, to a great extent, against mildew and a bad sample, there is the fact that the whole crop of this original 4-acre piece, both last year and this, was good in straw and in grain, while an added piece of about two chain, which had been manured for roots, and was in Wheat two years ago, was badly mildewed the first year, and barely escaped it this.

I have presumed to make public these details of growing Wheat without manure, because I cannot consider it otherwise than a matter of some public interest. For if out of an arable farm, say of 400 acres, a farmer could thus grow Wheat with profit year after year successively, without manure, on the same hundred acres; if he could thus grow his most paying crop, which, on this plan, neither requires nor will bear to be forced, he would have his great want supplied, and be enabled to dress the remainder of his farm more abundantly for those other crops, which will not only bear it, but, in most cases, absolutely require it. *S. Smith, Lois Weedon, August* 28.

A SKETCH OF PIPE IRRIGATION IN SCOTLAND, June, 1855.

(*Continued from p.* 571).

The next farm steading we visited was in Argyleshire. Taking a passage in the steamer which leaves every morning at 7 o'clock, we sailed down the Clyde, and through the Kyles of Bute to Ardrishaig, on Loch Fyne, arriving about noon. To those who do not know this locality, we can only say that the earlier they make themselves acquainted with it the better. The whole sail is a continued series of pictures, mountain, wood, and water, in endless variety of combination. At Ardrishaig, which is a small village situated at the entrance of the Crinan Canal, we found a first-rate hotel and posting establishment. The farm we visited is situated about six miles from the inn, on the high road to Oban. It is called Killinochanoch, and is the property of Neil Malcolm, Esq., of Poltalloch, who has a very large landed property in the neighbourhood, and whose splendid mansion, Calton Mhor, occupies a conspicuous place in the distant landscape. The farm steading is placed on a rising ground at the base of a hill, and immediately in front of it a vast extent of flat peat Moss is being gradually brought into cultivation. We believe it was principally with a view to the profitable improvement of this Moss that the experiment of the liquid manure system was commenced. We found two houses or byres for feeding cattle, and one house for sheep, all of which, together with the stables, house, and other farm buildings and dung courts, are drained into a small tank, and from thence the liquid is pumped up by water-power into a large reservoir on the hill above to an elevation of 100 feet. There are here two tanks, one for a reservoir, the other a mixing tank. A large reservoir of water fed by a small mountain stream at a still higher level completes the arrangement. From the mixing tank the liquid is conveyed in 3-inch iron pipes to the fields on the flat below by gravitation, and there applied by means of gutta percha 2-inch hose. There are at present about 67 acres under pipes. The whole of the buildings are built of stone and lime, with slated roofs and cast iron posts, and appear most substantial, without any needless expense in ornament or finish. The cattle sheds labour under the disadvantage of not having been built originally for the liquid system, but are, nevertheless, very complete. One byre 34 feet wide contained 66 head of cattle, in two rows of 33. A feeding passage ran along the centre 6 feet 6 inches wide, paved with asphalte. The cattle are tied in single stalls 3 feet wide, with a stone division between each 3 inches thick, 3 feet 6 inches high, and 3 feet long. The length of the stall is 8 feet from the feeding passage to the heel drain, including the feeding trough, which is 2 feet wide and 1 foot 2 inches high. The first 3 feet of pavement in the stalls are of brick, the next as far as the heel drain are of asphalte, but above this last is a flooring of wood, in spars 4 inches wide, 3 inches thick, and 2 inches apart, with a 9-inch drop into the heel drain, which is 2 feet wide, and the manure passage, which is 4 feet 4 inches wide. We observed that the feeding trough, which is formed of asphalte in a semicylindrical shape, runs the whole length of the byre without division, and the water is let in by means of a tap at one end. The supply of water is ample, and the pressure being great, the whole is kept very clean by means of hose and jet.

Another byre contained tyings for 66 cattle on the same principle. These sheds are ventilated by means of sliding wooden spars, which run along the whole of one side, and there are no roof lights; consequently, when the slides are closed there is but little light. This was done purposely, to keep the beasts quiet, and keep away flies in summer.

There was a house for feeding sheep, which seemed very well adapted to its purpose, and at the same time not expensive. The roof was slated, and supported on iron posts, 100 feet long by 20 feet wide; the side walls, 7 feet high, were built with stone and lime to the height of 3 feet, and above that were carried up to the eaves with wooden spars 6 inches wide and 1 inch thick, one half of which is made to slide in a groove on small iron wheels, so as to admit or exclude light and air at pleasure, the same as in the cattle house. A feeding passage 4 feet wide ran down the centre, paved with asphalte, and on either side were the sheep pens, raised 30 inches from the ground, and floored with wooden spars 1 inch apart, so that all the manure passed through the openings on to the asphalte pavement beneath, which sloped towards an open gutter bounding the feeding passage for its whole length, from thence passing through iron gratings into a drain beneath, which again conveyed the whole into the receiving tank. A feeding trough ran along the whole front of the pens next to the feeding passage, and a smaller one with a continuous stream of water at the back. The rails which kept the sheep in the pens in front were ingeniously contrived, by being hung on pivots to move from the front to the back of the feeding trough, in order to be able to fill or to clean them without interruption from the sheep. The whole cost of this building was not more than 100*l.* or about 1*l.* the running foot. The feeding of sheep had been most successful. We were sorry to observe that the late winter had been too severe for the Italian Rye-grass, the greater part had been destroyed—a thing always to be apprehended in severe winters from the character of the soil, improved peat Moss, which from its spongy nature, although admirably adapted for the Italian Grass in summer by imbibing large quantities of the liquid manure, is on this very account ill adapted for it in the winter, the young plant being apt to be thrown out of the ground by the expansion and contraction consequent upon the alternations of severe frost and warm sunshine. This system being here only in its infancy no pecuniary results can be given, but so far as it went last year on a small scale it paid sufficiently well to justify its extension, and it is now being carried out on a much larger scale. The tanks are constructed to contain 275,000 gallons, and there are houses for cattle and sheep, besides horses, &c.

Our next visit was to an establishment which we had heard much spoken of in the same county. It is situated in the island of Luing on the property of the Marquis of Breadalbane, by whom it has been called

into existence. As a liberal and patriotic nobleman his lordship's name has been often before the public, and if we require a proof that the enterprise and perseverance of the Scottish character is not confined to any one class, that it belongs to the peer as well as to the peasant, we have it here. Who could have expected to find in one of the isles of the Hebrides the latest improvements in agriculture carried out on a grand scale, and in a first-rate style of excellence? Yet here it is to be seen in full operation.

Through the polite attention of Alexander Pitcairn, Esq., factor and general manager on the Breadalbane estates in that part of Argyleshire, we were conveyed by means of an open boat and four oars from Ardmaddy House, one of the marquis's residences, to the Island of Luing, where we landed at the small village and harbour of Toberonochy. A straight road leads from the landing place to the farm buildings, which are situated on a rising ground a few hundred yards distant. The appearance of the large mass of substantial stone buildings, with the neat slated roofs, formed a strong contrast to the black houses or huts of the inhabitants which we passed at the landing-place. The space occupied by the buildings and courts is 231 feet by 219 feet, affording accommodation for 12 horses, 192 bullocks, 600 sheep, and 100 pigs, all under cover, and all drained of their liquid manure into a large reservoir or tank, containing 360,000 gallons. The tank is subterranean, built of stone, with groined arches resting upon two rows of pillars. It is immediately under one of the dung courts. The whole arrangements of the cattle house are admirable. The animals are all in one large apartment, ranged in 8 rows of 24 each, running from north to south. Along the northern end of the rows runs a wide platform or passage paved with dressed Dundee stone, with a door at each end; entering by the door at the eastern end, the rows of cattle run at right angles on the left hand, and on the right is a range of doors opening from the various compartments for food, dry or steamed. Here also is situated the steam-engine, with threshing, bruising, and chaff-cutting machines, forcing-pump, &c. On the left hand side of the stone passage or platform, and on the same level, between every 2 rows of cattle, run the 4 feeding passages, likewise paved with dressed stone, 5 feet 4 inches wide. On each side of this feeding passage is a wooden division, 4 feet high, finished on the top with a broad ledge or rail. In the wooden partition are 12 doors on each side, answering to the number of stalls for the cattle, which are tied up in pairs. These doors slide sideways on small wheels, and through them the food is passed into the feeding mangers from wheeled trucks. The manger is 2 feet wide, and has two divisions, leaving a large central compartment for the food opposite the sliding door, and giving a separate water trough in the corner before each beast. A sliding handle, like a bell-pull, in the passage opens a valve, and admits or excludes the water in each watering-trough, as required. The stalls are separated by divisions of solid stone, 4 inches thick and 3 feet 9 inches long. Into this are inserted the iron rods, which are upright, or rather diagonal, sloping backwards at top, on which traverse the rings of the chain with which the cattle are tied up.

Besides these four feeding passages, there are six passages running in the same direction, behind the cattle, for removing the manure and taking them in or out. These are made at a level 16 inches lower than the feeders, and entered by the stone steps from the platform at the north end, but terminated by doors at the south, leading into the manure courts outside, on the same level. These passages are 9 feet wide, except of course those at each end of the building, which are only half this width, being used only for a single row of stalls each.

The stalls for each pair of oxen are 6 feet 6 inches wide, and 7 feet long, or 9 feet including the manger. They are paved with asphalte and have a slope from the manger to the drain for their droppings, which is 18 inches wide, and 6 inches deep next the cattle, and 3 inches next the passage, which is also floored with asphalte. The difference of level between the passages is a good arrangement; it enables one to see the cattle to advantage before and behind, and gives less trouble to the person feeding. The side walls are 10 feet high, the roofs open, the woodwork planed and varnished, supported on hollow cast-iron pillars, down the last of which, nearest the wall, the rain from the gutters empties itself. There are large square ventilators at certain distances along the roof ridge, with louvre boarding sides. There is also a large stone built air pipe under each feeding passage, with grated openings at regular distances communicating with the external air by means of a grating at the end of the air pipe, which can be closed at pleasure. There is an abundant supply of water, which by means of flexible hose can be carried to any part of the building. The stalls and passages are kept constantly washed and clean, the water running away into the liquid manure tank. The cattle were chiefly 3-year old bullocks of the short-horned breed, and well on in condition, perhaps rather drier in the hair and more confined in their bowels than they should be; but as the Turnips were just over, and the Grass not yet come in, the time was most unfavourable for seeing them. They were getting steamed chaff with a little corn prepared in large iron steam vessels containing 180 gallons each, of which there were 12. The spare steam from the engine is made use of for this purpose, passing by pipes through a false bottom perforated with small holes. The heavy iron lids are hinged on the side next the wall, and hauled up by means of blocks and tackle; when down they are secured by thumb-screws, and rendered steam-tight by an ingenious insertion of a leaden circle where the rim of the boiler meets the lid, an invention of the factor, Mr. Pitcairn; perhaps balance weights and pulleys would be better for raising and lowering the lids, as saving time and labour. A tap is inserted in the boiler between the false and real bottoms, by which the liquor from the steamed food can be drawn off at pleasure. The steam-engine is of 10-horse power, and consumes half a ton of coal per diem. The diameter of the force-pump is 6 inches, the length of stroke 18 inches. The suction-pipe from the tank is 5 inches in diameter, and for two lengths of the discharge pipe it is the same; it then diminishes for 100 feet to 4 inches, then to $3\frac{1}{2}$, and after this to 3, and lastly to $2\frac{1}{2}$. The hydrants in the fields are 100 yards apart. The pipes are at present laid for 55 acres, which are all under Italian Rye-grass for the first time. Cutting commenced on the 18th of June, after which the irrigation commenced for the first time, and is continued as the Grass is cut. There are 75 acres under Turnip for winter keep. The stable is as perfect as possible: the walls 10 feet high, roof open woodwork planed and varnished as in the bullock house, width of building 19 feet, depth of stall 8 feet, width 6 feet 6 inches, iron foot-posts, asphalte pavement, grooved to prevent slipping, drained into tank. In the wall behind each pair of stalls is a recess, in which is a corn bin below and a cupboard above. The weekly allowance of corn is put into the bin, the lid of which cannot open when the cupboard above is locked. In the cupboard each carter has his shovels, broom, and all the etcetera of the stable. The sheep-house we did not approve of; it appeared to us to want free circulation of air. The sheep pens being in two tiers or rows one above the other, are too much crowded; the foul air does not escape as rapidly as it should, nor is there sufficient fresh air admitted for the number of sheep; in fact the experience of one season only in which it had been tried had been sufficient to prove the necessity of having fewer animals and more air. No animals thrive better in houses than sheep, if properly treated, but a certain degree of space and abundance of fresh air seem absolutely necessary to keep them in health.

The pig-house had not been fitted up, and it is probable that it will be put to some other use, as the expense of feeding these animals on a farm of this description and in such a situation is greater than the profit. We can give no results of the liquid system here, as the pipes were only laying down and much of the land only just drained and brought into regular cultivation; but everything seemed to be done in the most perfect manner, and in the mild and moist climate of the western highlands there can be little doubt as to the large crops of succulent food which may be obtained. The island of Luing is about 6 miles long by 2 miles broad, but not more than a third of it is in the Marquis's occupation at present. The acreage of the whole island is about 3500 acres, of which in 1848 about 1200 were arable. The land in the Marquis's occupation consists of about 936 acres, of which in 1848 there were 377 acres arable; now, however, the arable land has been much increased by draining and cultivation.

It may give some idea of the spirited manner in which these improvements are carried out if we give the dimensions of the great leading cut or open water-course into which all the land is drained. Its average depth is from 9 to 10 feet; width at the top, from 9 to 12 feet; width at the bottom, 3 feet. It is paved with slate flags where there is no rock, and built up the sides with stone for 3 feet for security. It has two branches running up separate valleys, and the whole length is above $1\frac{1}{2}$ mile, or 2891 yards exactly. The soil is fertile, but much requires to be done yet before it can be brought into good farming condition. Too much praise cannot be given to the noble proprietor for this magnificent attempt to bring out the capabilities of these western islands, and so afford natural employment to the population by the development of their county's resources. *J. A. C., of Argyle.*

(To be continued.)

WATER MEADOWS.

By Sir Stafford Henry Northcote, Bart.

[From the Journal of the Bath and West of England Agricultural Society.]

The system upon which water meadows have been laid out and managed in the West of England is generally admitted to be superior to those followed in other parts of the country. The skill displayed in bringing water upon lands on the hill-side at very high levels, and the economy of the process when compared with the costly systems adopted in some other counties, have excited the warm admiration of competent judges.* So highly have the advantages of water meadows been valued in some of the southern counties that as much as 30*l.*, 40*l.*, or 50*l.* per acre has in many cases been expended in forming them, by casting the whole surface of the ground into high regular ridges, with gutters along their crests and along the valleys between them, the former to bring the water on, the latter to carry it off when it has overflowed the slopes of the ridges. In our own districts it has long been the practice to water our land in a manner quite as efficacious as that to which we have alluded, but at an outlay of little more than one-tenth of that of our neighbours. This we have done by means of our catch-meadows, which have commonly been laid out at an expense not exceeding 4*l.* or 5*l.* per acre.

The principle adopted in making a catch-meadow is that of leading the water along the natural inclination of the ground in such manner as to keep it at the highest possible level along the field which is to be watered, and cutting gutters, one below the other, to catch the water as it flows down over the land, and to distribute it regularly over each successive portion. In some cases the process is to cut a number of branches to take the water from the carriage gutter in various directions, and to direct the stream into one or other of them by means of "stops," according to the part of the field which it is desired to irrigate. When the supply of water is insufficient to cover the whole surface of the land, one portion is watered at a time, which is of course a less satisfactory and a more expensive process than watering the whole at once, inasmuch as the water cannot be laid on all over the ground while it is at its best, *i. e.* after the first heavy autumn rains; and the necessity of frequently altering the stops and attending to the progress of the water as it is brought off one piece and on another involves additional labour.

It is therefore obvious that any improvement in the system of irrigation which tends to effect an economy of water must be of considerable importance; and if such improvement can be accomplished by a system which renders the original formation and periodical restoration of the water meadow simpler and cheaper, it is well worthy of general adoption.

The credit of having introduced into practice a system answering to this description belongs to Mr. Bickford, of Crediton, to whose improvements atten ion has already been called in the "Journal of the Royal Agricultural Society."† His plan is as follows:—

A carriage-gutter is in the first place cut in the usual manner along the line of the highest ground. The inclination of this gutter should, if possible, be such as to give a fall of 2 inches in 4 land-yards, or 1 in 396; but if such a fall cannot be obtained, a much less rapid one will answer the purpose. The gutter should be about 1 foot wide, and about 6 inches deep. These dimensions, which are much less than those usually observed upon the old system, should be gradually contracted as the gutter approaches its termination, so that it may at last die into the ground. Below this carriage-gutter, and in the same direction with it, are cut other and smaller gutters, which are perfectly level from end to end, and which successively catch the water as it trickles over the land immediately above them, collect it, and when they are full, begin to overflow at all points at once, and so to distribute it evenly over the next section.‡ In laying out these gutters the use of the spirit-level is superseded by a very simple and convenient instrument. It is composed of three pieces of wood, put together in the form of the letter A, standing about 5 feet high, and having a span of about 4 feet at the bottom. A plumb-line is suspended from the top, and a notch is made in the centre of the cross-piece, so that when the two feet stand on the same level the line crosses the notch. The gutterer rests one of the feet upon the ground, and, using this as a pivot, turns the whole round like a pair of compasses till he finds by the plumb-line that the two feet stand even; he then marks the spot where the first foot stood, and, using the other foot as a pivot, finds the next level spot in the same manner, and so proceeds with great rapidity to trace out a level line through the field, marking each spot as he goes on. When this is accomplished, he takes the gutter-plough (an important part of the system), and proceeds to cut a furrow of about 4 inches wide, and about 3 or 4 inches deep, along the line of the marks, thus producing a small level gutter, quite as large as is necessary for catching and distributing the water, but not large enough to be an annoyance to the occupier of the land by upsetting his hay-carts, throwing down his horses, or serving as a pit-fall for his lambs.

The old-fashioned gutters, besides being open to the objections just alluded to, have the further disadvantage of absorbing a large quantity of water, rendering it difficult or impossible to irrigate with a small stream, retaining a considerable proportion of the wealth of the water in the shape of a deposit of sediment at the bottom, and promoting the growth of coarse, sedgy Grasses along their margin. They are, moreover, more expensive both to cut in the first instance, and to clean out in each succeeding year, than the small Bickford gutters, which are rapidly and easily cut with the plough every year, and therefore require no cleaning.

The plough which is made use of for this purpose is simply an adaptation of the common horse-hoe, the feet of the latter being replaced by two upright knives in front, and a furrow-slicer § behind. The two knives

* See Mr. Pusey's interesting article "On the Theory and Practice of Water Meadows" in the "Journal of the Royal Agricultural Society," No. 24, 1849, vol. x.

† Any one who wishes to try this plan may be strongly advised to read attentively the two articles in the "Journal of the Royal Agricultural Society," written respectively by Sir Stafford Northcote and Mr. Bickford. They have the advantage of being illustrated by several good plans and diagrams. The articles are in vol. xiii., pp. 162 and 172.

‡ The practical purpose of the level gutters is explained in the text with perfect clearness, and, theoretically speaking, in order to fulfil the purpose indicated they should be perfectly level. In practice, however, it will be found advisable to give and take a little—that is to drop the gutters over the hills or projecting surfaces, and to raise them in the valleys or receding surfaces,—in the first case to insure the water covering the hills; in the second, in order to prevent its lingering in the hollows.

§ The knives answer to the coulter of a plough, and cut the sides of the gutter. The furrow-slicer performs the part of the fin, or the wing as it is sometimes called, that is, it severs the furrow-slice from the ground on its under surface. I have found

are set at a distance of 6 inches from one another, but may be screwed up closer, so as to leave a space of but 4 inches. Their distance regulates the width of the gutter, which they mark out and cut vertically as the plough proceeds; the furrow-slicer, which is placed behind them, and which is fixed horizontally, scooping out the sod at the proper depth. The instrument is easily managed; and when once a meadow has been laid out, a common labourer can keep it in order, by cutting every year fresh gutters by the side of the old ones, and filling up the latter with the earth he takes out. This is better than cleaning out the old gutters, as it checks the tendency to the production of aquatic Grasses. The expense of cutting the fresh gutters, the level having once been ascertained, does not amount to more than 1*s.* an acre; whereas the cleaning out of old gutters with the ordinary tools cost at least 2*s.* The price of the plough is 3*l.*

The expense of laying out a water-meadow on Mr. Bickford's principles must of course in great measure depend upon the character of the ground. From the best information I can obtain I am led to believe that it may be reckoned on the average at about 1*l.* an acre. On the land in my own occupation to which I have applied the system the cost has been somewhat less, but then the land had been previously watered in the old way, and portions of the former carriage-gutters were available for the new work. The gutterer whom I employed (Mr. Edward Ellis, of Newton St. Cyres) has since had a good deal of occupation in laying out meadows in various parts of England, and I understand from him that he considers 1*l.* an acre a fair average price. Looking to the great benefit conferred upon the land by the process, the cost must be regarded as wholly insignificant. In many cases the whole outlay may be recovered in a single year.

EXPERIMENTAL GRASS FARMING.

I propose to make an experiment in the management of Grass land, on which I shall be glad to see the observations of yourself or of such of your intelligent readers and correspondents as may choose to offer their opinions in anticipation of the result. I propose to make the experiment on a field of 6 imperial acres, which is in pasture, and is now rented at 16*l.*, from May 1 to November 1; land of good quality, and well drained. The experiment is as follows:—

1st. To apply in the spring 4 cwt. of the best guano in solution and mixture with 5000 gallons of water per acre; the irrigation to be made by means of iron pipes laid underground, and by hose and jet, from a tank placed 80 feet above the level of the field, so that the water and guano will be distributed with facility and efficiency under that pressure. The irrigation will be regulated as to time by the season and weather; but it is proposed to apply it in February or March—perhaps early in April; and if the month of May should be very dry, there will be no difficulty in applying by the same means 5000 gallons of pure water per acre.

2d. It is proposed to take a crop of hay, which ought to be of the finest quality, and it is expected that it will come early, and probably be cut and made by the middle of June.

3d. As soon as the hay can be moved to a corner of the field, it is intended again to apply 4 cwt. of guano in solution and mixture, as before, with 5000 gallons of water per acre; and again to allow the Grass to grow for a hay crop, which it is supposed may be cut for the second time about the time of harvest in the fields around, and saved as well as the adjacent crops, more or less well, according to the season. The question is, Whether the powerful manuring will not produce a second fine crop, and what, under such treatment, may be the probable value of the two crops? Is it too much to expect that the first crop of hay may be worth 12*l.*, and the second 8*l.* per acre—together, 20*l.* per acre?

4th. If such should be the result, how will the account stand at the end of the first and second years? for it is proposed to pursue the system, and to apply the same treatment in consecutive years, in the belief that the benefits, such as they may be, will proceed in an increasing ratio. The expense will be as follows:—

Cost of tank, pipes and hose		£65	0	0
24 cwt. of guano—1st crop } about		30	0	0
" " 2d crop }				
Total cost 1st year		95	0	0
If the crop should be worth, 1st crop ...	12*l.*			
2d crop ...	8*l.*			
Per acre ...	20*l.*			
Six acres ...	6			
	120*l.* ...	120	0	0
Surplus of produce over expenditure, 1st year ...		£25	0	0

This presents a remarkable result, and at all events so great a margin as to make the experiment at least a safe one; and if it be assumed that the expenditure is repaid in the *first* year, the second year would stand thus, and no interest is charged because the capital is repaid.

Value of two crops, as before	£120	0	0
Cost of guano, or an equivalent quantity of nitrate of soda for one of the dressings ...	30	0	0
Net surplus produce	£90	0	0
Or 15*l.* per acre.			

Again there is a fair margin to meet a short-

it answers my purpose best to separate the two actions; to fit the knives or coulters into the iron cross-piece of Newington's hand cultivator, which one man can easily draw by hand; the piece of turf is then severed on its under surface by a narrow sharp shovel.

coming in produce or such casualties as are incident to all rural affairs, but it is difficult to see that there is any great practical fallacy in the system, and if so there seems to be proved that in very positive fact additional value may be conferred on land in Grass, the large money transactions which are attendant on arable cultivation being avoided.

If such advantages are attainable where irrigation can be effected by the power of gravitation, the power of steam could be afforded where water could be had, but where the shape of the country did not admit of gravitation.

If the system were pursued for a series of years, it is believed that a beneficial effect would arise from the application of a small quantity of lime, were it only 10 bushels per acre, to be washed in in the same manner, the expense only 7*s.* or 8*s.* per acre. It would be easy to test the utility of such an application on a small scale before it was resorted to. *A. B.*

Home Correspondence.

Potato Growing.—I think the following plan of growing Potatoes more simple and judicious than the details given by your correspondent at page 522. In autumn a piece of stubble land is thoroughly cleaned, then towards the end of November green or fresh fold-yard manure is applied broadcast, at the rate of 8 to 10 tons per acre. The land is then immediately ploughed a good depth, and thus it remains exposed to the free agency of the atmosphere till spring, when the surface is occasionally stirred by the grubber, harrows, &c., so as to keep the weeds in check. At the time of planting we are content with having the land lightly ribbed over, say at a depth of about 4 inches; then at this depth, and about 27 inches apart, we place the tubers whole 10 inches asunder, and before covering them a sprinkling of Peruvian guano is strewed along with the tubers, at the rate of 10 stone per acre. By having recourse to this treatment and selecting a tolerably dry soil there would be no fear of success as regards the growth of the Potato, and I am not very sure too that this practice has not something to do with diminishing the amount of disease. I have tried the use of lime by sprinkling it at this season along the tops of the drills and found no good effects from it any more than where this was not done. There can be no use in giving the expenses attending the above plan, as every practical man will be able to estimate that in his own locality. *P. Deane.*

Dairy Statistics.—If the following is of any use to you, or any of your readers, you are welcome to it. I had in the year

		£	s.	d.
1847 ... 4 cows, average value of produce per cow		13	15	6
1848 ... 7	" "	13	10	0
1849 ... 8	" "	13	18	6
1850 ... 6	" "	12	9	6
1851 ... 7	" "	13	3	9
1852 ... 8	" "	12	16	2½
1853 ... 8	" "	13	0	0
1854 ... 8	" "	11	7	11½

The produce was made up thus:—

	£	s.	d.
8041¾ lbs of butter	404	12	2
51 calves	118	3	6
Milk and cream	203	6	3½

The cows were about half of them Alderney, the others short-horns. They were not highly fed; they eat Cabbages or Turnips while being milked, and neither buttermilk nor cream was injured. *G. F. D.* [Many thanks. Pray tell us what method was employed when the cows fed on Cabbages and Turnips to keep the butter sweet.]

Yorkshire Crops.—I spent the whole of last week in journeying through the North and West Ridings of Yorkshire, and over a great portion of the midland counties, and the following is the result of a very attentive examination of the corn and root crops seen during my progress. The Wheat crop is in general a very bulky one; but on good land it is everywhere much lodged—rust is seen here and there, though not to any very great extent—but a fine heavy bright crop is nowhere to be seen. From my own observation, aided by the opinion of the most intelligent farmers I have met with, I can have no doubt but the Wheat sample of this year will prove generally a very mixed one; on all the fields where the crops were much and early lodged, many of the ears have a deaf or imperfectly filled side, and hence, when the grain is rubbed from the chaff it either gives very few grains, or one half of them are long and lean and will yield nothing but bran when ground. Oats are a full average crop, and although a good deal lodged are not nearly so much damaged as Wheat. Barley is also an average crop, a good deal down, and will not I fear prove a very bright sample. Potatoes are a good crop, but the disease is showing itself unmistakeably, and in my opinion will extend itself as the Potato becomes more generally ripe. Turnips are on the whole a late and, I think, a very inferior crop, and in many places nearly lost in weeds. The harvest will be general in Yorkshire this week; in the midlands most of the Oats and Barley will be in the stackyard in this month, but very little Wheat will be secured so soon. *Roaldus.*

Oilcake.—If the information that I have lately received be correct, the adulteration of oilcake is being carried on to an unprecedented extent, and the profit on it throws guano making into the shade. A neighbour of mine has been in the habit of buying the sweepings and rubbish of different mills, sifting it, and fatting old sows with the dust and dirt, selling what whole corn he gets to the miller, broken corn to his neighbours for their chickens, Charlock and other seeds to an oil-mill, at 1*s.* per bushel, to be mixed with and sold for an article which costs seven times as much. But now his occupation is gone, the cake-makers have overbid him, and are using this precious compound, which costs under 1*l.* per ton, in making cake for which we have to pay 12*l.* and 13*l.* per ton. The manager of a mill told my informant that they were bid more money for it. A carman overhearing, says, "That is to go into Essex, we often send 100 tons a week." The first part of my communication is perfectly correct, and can be proved. The latter is not so well authenticated, but if such practices are going on, I thought you the most likely party to ferret it out; the majority of agriculturists look upon you as their protector and instructor. If such practices are going on, it would put the parties on their guard. *B* ——.

Crops in Lincolnshire Fens.—Our harvest being so very late I did not think I could give a correct report before the 11th. The Wheat crop on peaty soils will be very deficient, I think the worst I have ever known; and upon the fine soils in this parish and neighbourhood all that is laid, of which there is a considerable quantity, the quality will be very bad, 4 lbs. to 5 lbs. per bushel less than last year. *T. Aitken, near Spalding.*

Potato Culture.—I should like to solicit your opinion on a plan which I adopted in the cultivation of early field Potatoes called Shaws. I prepared my ground in the usual way—ridge culture. The usual practice in my neighbourhood is to set the plants 9 inches apart, the rows being 27 to 30 inches wide. I resolved to plant 27 inches by 27 inches, for in this way I felt that light and heat would more readily be transmitted to the plant; and I moreover split that portion of the ridged earth between the plants so as to afford a convex surface to the space it occupied. In this way I expected to insure a larger surface exposed to the sun's heat. As it is important to get the Potatoes early to market, I expected the bine of my plants would not be unnaturally forced, and that the energies of the plant would be directed to the formation of tubers. The result has not met my expectation; not that I consider it has failed under the conditions. I had a very large growth of bine, and my Potato plants suffered under the fangs of the wireworm. What I wish to elicit is, in dealing with the Potato plant which is the best plan to insure a growth of tuber? Can it be attained by wide or close planting? *A. B., August* 27.

Wheat Midge.—I observe in the Agricultural part of last week's *Chronicle* an inquiry about the Wheat midge. I may mention that one field I saw was much affected with it, and I have heard by the remarks of others that it is to be found in some of the fields round here, but I think not to any great extent generally; but would it not be well for those whose corn is affected to take great care at the time of threshing out to burn all the chaff and dust winnowed from this corn—that they might destroy it while in its chrysalis state and thereby benefit themselves and neighbours another year? *J. Divers, Maidstone.*

Alderney Cow.—As you have thought the statement mentioned in my letter worth noticing (see p. 540), I will add that within the last few days the quantity of butter made from the milk of the cow has been ascertained, viz., 7 oz. from one day's milk, being 4½ quarts. We make butter after the Devonshire manner. *J. G.*

Foreign Correspondence.

Dairy Produce.—Observing that you have lately taken up this subject in the *Agricultural Gazette*, and that you are desirous of obtaining as much information as possible thereupon, I am induced to offer you the result of my experience on this side of the Atlantic. I have for several years kept an exact register of all my dairy produce in the following manner. The milk of each cow is measured morning and evening, and the quantity entered by me in a book under the name of the cow; in different columns I enter the quantity of milk furnished to the house, consumed by calves, &c.; the remainder is what is to be made into butter. I make butter (in the Devonshire manner—scalding the cream) three times a week in summer, and twice a week in winter. At the end of each week I register the quantity of milk made into butter, the quantity of butter made, and the number of quarts of milk it has taken to make a pound of butter; at the end of the month I enter in another book the average number of quarts of milk it has taken to make a pound of butter during the month, and when the twelve months are completed, the average number for the whole year. I am thus enabled to show at any moment what quantity of milk was required to make a pound of butter in any given week; I can also tell from my book what the food of the cows was during the week, or the average for any month, and finally the average for the year. I find that in 1854 the average for the year was 8½ quarts of milk to make a pound of butter; the smallest quantity was 6 quarts in the first week of May, and the greatest 9½ quarts in the month of August. My cows are not extraordinary milkers; they are a cross between the short-horn and Ayrshire. I find they fatten easily, being always kept in good condition. I have no difficulty in disposing of them to the butcher when I no longer want them for the dairy. Their food in summer is Clover, Vetches, and Indian Corn cut green. We can rarely get a bite of Grass before the 20th of May, and our Clover is ready to cut about the second week in June; the Vetches come between the two; cuttings

of Clover and the Indian Corn, which does well in our hot and dry summers, gives green food up to the middle of October. With the exception of a fortnight before the first Clover is ready to cut, the cows are kept in the stable, being turned out for about an hour every morning. The food in winter is hay, chaff, roots, and about 3 lbs. of the meal of Indian Corn, Beans, Peas, or Barley, given in a warm drink to the cows giving milk. After repeated experiments I find that I obtain the greatest quantity of butter from the smallest quantity of milk. When the food is hay, Bean-meal, and Parsnips, I have invariably found the quantity of butter to increase with Parsnips; with Turnips, Mangold Wurzel, and Carrots, I have not found much difference. Red Carrots give the butter rather a deeper colour during winter; in other respects I have not found them superior to Mangold Wurzel. Turnips give a taste to the butter which prevents their being made much use of. *T. Edmund Campbell, President of the Board of Agriculture of Lower Canada, St. Hilaire, Canada East.*

Societies.

ROYAL AGRICULTURAL OF ENGLAND.

THE deferred trial of the Reaping-machines selected at the Carlisle Meeting took place at Abbot's Leigh, near Bristol, on Wednesday, the 29th of August, in the presence of Mr. MILES, M.P. (President of the Royal Agricultural Society of England at the Carlisle Meeting), Sir Stafford Henry Northcote, Bart., M.P. (Steward of Cattle at Lincoln), Sir Archibald Keppel Macdonald, Bart. (Steward Elect of Implements at Lincoln), Mr. Dyke Acland (one of the Editors of the Journal), Mr. Raymond Barker (Vice-President and Chairman of Finance), Mr. Brandreth Gibbs (Honorary Director of the Show), Mr. Granger (Judge of Field Implements), Mr. Hamond (Steward of Implements at Exeter, Lewes, Gloucester, and Lincoln), Mr. Fisher Hobbs (Steward of Implements at Lewes, Gloucester, Lincoln, and Carlisle), Mr. Hudson (Secretary of the Society), Mr. Huskinson (Judge of Field Implements), and Mr. Clare Sewell Read (Judge of Field Implements); including, among the exhibitors, Mr. Burgess, Mr. Alfred Crosskill, Mr. Dray, Mr. Key, Mr. Peter Love, Mr. Mackenzie, Mr. Palmer, and Mr. Suttie; and among the general company Sir John Key, Bart., Captain Gordon, Mr. Philip Miles, Mr. Knatchbull, Mr. Pitman, and Mr. George Pope.

Mr. Miles having directed every arrangement to be made for the supply of his own horses to work the machines, and for the order in which successive crops of Wheat and Barley, under the most favourable as well as under the most unfavourable circumstances for reaping, were to be cut, the competing machines were set to work simultaneously, under the orders of Mr. Fisher Hobbs, and the inspection and critical examination of the judges. No pains were spared by every one engaged to render the trial in every respect perfect and satisfactory. This result was finally attained, and it is probable that no reaping-machines in this or any other country have ever been more severely, impartially, or satisfactorily tested than in the trial at Abbot's Leigh.

I. PRIZES OFFERED.—For the best Reaping-machine, 30*l.*; for the second-best ditto, 20*l.*

SPECIAL CONDITION.—In adjudicating on the Reaping-machines, the attention of the Judges will be particularly called to the best mode of delivery.

II. JUDGES' AWARDS:—

"Leigh Court, August 29, 1855.

"We award the 1st Prize of 30*l.*, for the best reaping machine, to Stand 68, Article No. 1, Messrs. Burgess & Key, for M'Cormick's reaper improved by themselves.—The 2d Prize of 20*l.*, for the second best ditto, to Stand 79, Article No. 3, Mr. John Palmer, of Stockton-on-Tees, for Forbush's reaper improved by the exhibitor.—We highly commend Stand No. 34, Article No. 3, Messrs. Dray & Co., for Hussey's reaper improved by themselves.

"T. W. GRANGER.
"THOMAS HUSKINSON.
"CLARE SEWELL READ."

III. EXHIBITORS' CATALOGUE-SPECIFICATIONS.

Stand No. 68. Burgess & Key, of 103, Newgate Street, London. Article No 1. (New Implement).—A reaping machine; invented by Cyrus Hall McCormick, of Chicago, United States of America, improved and manufactured by the exhibitors. It received the Council Medal at the Great Exhibition in 1851; the Prize Medal at the Yorkshire Show in 1852, the award of the Driffield Farmers' Club; first prize of the Durham County Meeting at Sunderland; and the award of the jury appointed at the nine days' trials of reapers at the Royal Agricultural College at Cirencester, and after the test of four years it is found to be a machine which will cut under any circumstances when desirable. It is so constructed and of such materials that it is not liable to get out of repair, and is easy draught for two horses, and when required can be repaired by any carpenter and blacksmith on a farm without sending it to the manufacturer. The only objection to this reaper was owing to the fact that our crops being much heavier than those grown in America (where some thousands of these machines have been in work for the last 14 years), it is found in some cases to be very hard work for the man to rake the cut crop off the machine; and this objection we believe we have completely overcome by means of our patent Archimedian screw platform, which, without adding to the draught, delivers the cut crop off the side of the machine in a perfect swathe. The only labour, therefore, now required to work this machine for a day on level land is two horses and a lad of about 15 to drive; on hilly land the draught is, of course, more, and a change of horses would be required. Price 35 guineas.

Stand No. 79. John Palmer, of Stockton-on-Tees, Durham. Article No. 3.—(New implement.)—A combined reaping and mowing machine; invented by Forbush & Co., of Buffalo, United States; improved by the exhibitor; and manufactured by Forbush & Co., and the exhibitor. This machine is especially adapted for small occupations, and it is also suitable for large occupiers, when it is thought desirable to deliver the corn in sheaves. The driving works of the machine are so arranged as to prevent a side-draught or a tendency in the machine to run into the uncut corn. There is no pressure upon the horses, the machine being evenly balanced. The knife cuts from the centre of the driving-wheel, hence the stubble is left the same length on the ridge as in the furrow. From the peculiar construction of the guards, and the pierced or skeleton knife, the tendency to choke is completely overcome. By the application of Palmer's roller platform, the heaviest and longest crops are delivered with ease. By using the radiating roller platform, Barley, Oats, and short Wheat are delivered at the side, out of the track of the horses. Price, with back platform, 25*l.*; with radiating platform, 5*l.* extra.

Stand No. 34. William Dray & Co., of Swan Lane, Upper Thames Street, London. Article No. 3.—A patent Reaping-machine; invented by Obed Hussey, of the United States, improved and manufactured by the exhibitors. This machine has considerable advantages over that known as "Hussey's Reaper," and received the prize of the Royal Agricultural Society at Lincoln, 1854, in addition to those of the Bath and West of England, the Stirling, the Burnley, and North Lancashire, all in 1854; thus gaining every prize for which it competed. Its great advantages consist in its having a tilting-platform, which enables the attendant to deliver the grain with the greatest ease; a patent skeleton knife, instead of the solid blade in the original, which effectually prevents choking; has a leverage for raising and lowering the cut, and a wheel to relieve the horses of the weight of the machine. Price 25*l.*

Thus has concluded a trial which will be memorable in its immediate effects, and in the future results to which it will doubtless lead. The report of the stewards and judges, in reference to its details, along with the report of Mr. Fairburn (communicated to Mr. Miles), on the trial of reaping-machines at Paris, will appear in the next part of the Journal of the Society. In the meantime, Messrs. Garrett & Son, of Saxmundham, and Messrs. Ransomes & Sims, of Ipswich, have entered into arrangements to manufacture for Messrs. Burgess & Key the reaping-machine which has gained the first prize at Abbot's Leigh.

The splendid character of the weather, the beauty of the scenery, and the truly English hospitality displayed at Leigh Court; the excellence of the trial, and the satisfaction and generous rivalry only of the competing exhibitors, were all of them gratifying circumstances, which appropriately terminated Mr. Miles's presidency of the Royal Agricultural Society of England, in the same spirit and with the same decided effect as had marked its progress in every transaction from the commencement.

ANERLEY POULTRY SHOW.—A show of Poultry, remarkable for both the quality and quantity of the birds exhibited, has been held during the past week in the Anerley Gardens. Many of the classes were remarkably well illustrated, and deserved a larger number of visitors and admirers than, from the state of the grounds when we were in them, there appeared to be. There were thirty-six pens of Spanish of admirable quality—Mr. Davies, of Hounslow, and Mr. Plummer, of Brislington, being the most successful of their exhibitors. One hundred pens illustrated the merits of the Dorking breed in its several varieties of coloured, speckled, and white; and among the successful owners were Mr. Davies, Mr. Lewry, of Crawley, Mr. Elgar, of Reigate, Mr. Antil, of Portsea, and others.

There were no fewer than 122 pens of Cochins—cinnamon and buff, grouse and partridge feathered, and white—and a very remarkable show they made. Mr. Fookes, of Whitechurch; Mr. Fairlie, of Cheveley Park; Rev. G. F. Hodson, of Bridgewater; Mrs. Ford, of Ide; Mr. Chase, of Birmingham; and Mrs. Herbert, of Powick, carrying off the first prizes in the several classes. The Game classes, Polands and Hamburghs, were represented respectively by 80, 60, and 101 pens:—Messrs. Monsey (Norwich), Matthew (Stowmarket), Titterton (Birmingham), Shield (Sydenham), and Strange (Bedford), being the 1st prize holders for Game fowl. Messrs. Marshall (Taunton), Worrall (Liverpool), Dixon (Bradford), Fellowes (Norwich), Burnett (Lancashire), Archer (Malvern) and Botham (Slough), succeeding among the Hamburghs; and Messrs. Adkins, of Edgbaston, Battye, of Holmfirth, Bush, of Bath, Dixon, of Bradford, and Symonds, of Milborne, St. Andrew's, being prize-holders among the Polands.

We have not space to specify the other classes. The geese were remarkably fine, and the ducks were good too. The accommodation for them was defective, owing to want of shelter from the extreme heat of the day. The silver cups for the best collections of poultry were awarded to Mr. Davies and Mr. Botham. The show generally was one of the best opportunities we have seen of studying leisurely and satisfactorily the merits of the different breeds and specimens. This we regret was owing partly to the comparatively small number of visitors present.

Miscellaneous.

Value of Farm Labour.—Labour being one of the most serious items of expenditure on a farm, ought to be the subject of the most accurate calculation, and may be divided into two parts—manual and team-work. My object is, therefore, to endeavour to arrive at some fixed value of each as a basis for calculating the expense of cultivating the different crops, thereby enabling the farmer to judge for himself, with very little trouble, how he stands with regard to profit and loss in his different fields. Bayldon, on "Rents and Tillages," devotes his fifth chapter to the same subject; but the rapid strides of agriculture, and the various customs prevailing in the different counties, render a work adapted to one of very little use to those residing in another. The principle Bayldon assumes is that the daily wages of a labouring man are equal to the price of a peck of Wheat. This I believe will be found incorrect. As far as this county is concerned, for the last seven years it would stand as follows:—

	Average per bushel.	Daily wages.
1847	8*s.* 8¼*d.* ...	2*s.* 2*d.*
1848	6 3½ ...	1 7
1849	5 6½ ...	1 4½
1850	5 0½ ...	1 3
1851	4 9½ ...	1 2½
1852	5 1 ...	1 3¼
1853	6 8 ...	1 8

The principle of laying down any stated rule to calculate wages on cannot be carried out: the very fact of the loss of the Potato crop would in itself overthrow any calculation adapted to previous years. In 1853 we have the nearest approach to the average of our wages: 1*s.* 10*d.* per day may, I think, be stated as the average of ploughman's wages, or 1*s.* 8*d.* per day and cider, and other labourers 1*s.* 6*d.* per day and cider, or 1*s.* 9*d.* altogether; the ploughman's additional 2*d.* per day being fairly earned by his extra hours in the care of horses. For the sake of calculation, therefore, and from past experience, I think I may fairly adopt the 1*s.* 10*d.* and 1*s.* 9*d.* per day as the value of manual labour. With regard to the value of team-work, a very different calculation requires to be made. In order to estimate it, we must presume that the horse is healthy and in good condition, and that he works 300 days in the year, allowing 65 days' rest for Sundays, bad weather, and other causes; we must calculate, however, on 365 days' keep, as he is getting the same food all that time. Now horses, when kept on dry food, cannot, to do them justice, have less than 1 peck of Oats and 21 lbs. of hay per day. During the last seven years Oats have averaged a trifle more than 2*s.* 6*d.* per bushel, but I will take them at 2*s.* 9*d.* per bushel; consequently the horse's consumption, being 1¾ bushels per week, will be equal in value to 4*s.* 10*d.* and his hay (good clover), at 2*l.* 10*s.* per ton, to 3*s.* 3*d.* On this he is supposed to be kept 30 weeks; his keep, therefore, during that time would amount to about 12*l.*; the remaining 22 weeks he will be on green food, and eat as near as possible in value about 5*s.* per week, or for the 22 weeks 5*l.* 10*s.*

30 weeks' keep, at say 8*s.* per week	£12	0	0
22 weeks' keep, at 5*s.* per week...	5	10	0
	£17	10	0

or 6*s.* 9*d.* a week as the cost of a horse's keep. No doubt some will differ from me in this calculation, for, as a general rule, more horses are kept at a less than at a higher rate; still they must allow it is not more than the necessary food to keep a good horse in fair working condition. In this county farms are not generally large, and 200 acres may be taken as a fair size to make calculations on; and for such an estate the following horses and implements would be required:—

7 horses, at 30*l.* each	£210	0	0
3 carts, at 8*l.* each	24	0	0
3 wains, at 8*l.* each	24	0	0
3 ploughs, at 3*l.* each	9	0	0
2 pair harrows, at 3*l.* each	6	0	0
Drag harrow	4	0	0
Seed harrow	2	0	0
Rollers	7	0	0
Grubber	7	0	0
Clodcrusher	18	0	0
Turnip hoe	3	0	0
Turnip drill	10	0	0
Corn drill	10	0	0
Grass seed sowing machine	3	0	0
Hay turner	10	0	0
Thrashing machine and chaff cutter	50	0	0
Winnowing machine	8	0	0
Turnip cutter	8	0	0
Harness (both cart and plough)	20	0	0
Bags	8	0	0
Sundries (rakes, weights, &c.)...	9	0	0
	£450	0	0

The sum of 450*l.* is, therefore, to be divided amongst seven horses, leaving about 64*l.* 5*s.* average capital per horse. Fifteen per cent. may be considered as a fair average for wear, tear, and repairs, and should be added to the 64*l.* 5*s.*, making the average capital per horse 73*l.* 17*s.* From this it appears that on a farm of 200 acres, to carry on the different farming operations, the sum of 73*l.* 17*s.* per horse is required, and as the farmer has not the means of turning over his capital so quickly as the merchant or manufacturer, another 15 per cent. on his sunk capital should be added. The value of horse and man having already been fixed, it will stand as follows:—

Keep of two horses, 13*s.* 6*d.* per week, or per working day	2*s.*	3*d.*
Man's wages	1	10
15 per cent. on sunk capital, at 73*l.* 17*s.* for each horse ...	1	5
	5	6

giving 5*s.* 6*d.* as the value per day of a man and pair of horses working on a farm, after allowing the farmer a fair interest for wear, tear, and sunk capital. I trust these few calculations will be received as the endeavours of one whose aim is to draw the attention of agriculturists to the necessity of not confining themselves to the mere knowledge of the gross expenses of the working of their farms generally, and to aid them in becoming more intimate with the detailed cost of their crops in each field, thereby placing them in a position to see the more readily what each crop should sell at, to return a fair remuneration for their outlay. *Journal of the Bath and West of England Agricultural Society.*

Calendar of Operations.

AUGUST.

SOUTH HANTS, *Aug.* 29.—As the Wheat falls before the sickle the quality and probable yield become more apparent and certain. The early and strong winds from the westward during the blooming of the Wheat has affected the Wheat plant much

there are large and numerous areas of the Wheat plant black and dingy in colour, and this more apparent in the more backward breadths of Wheat, but even in the more advanced the straw was coated its full length with red dust (rust) which covered the reaper's face and arms with "a coppery hue;" the ears contained many shrunk corns, and the character of the sample denotes there will be much "tailing" when it becomes to be "managed." "Horny berries" are numerous. Some fields are blighted in patches, and in other parts of the country the whole field presents both in the ear and the straw a dirty, smutty, dingy character. Indeed, smut prevails in certain districts also. The yield of straw is bulky, but the generality of the ears are small, and unevenly filled, and a non-agriculturist driving along the roads of this county might imagine by the sight of the numerous "aisles" (?) it was a fine crop; but they are like the painted sepulchres of the Jews—the inside not so fair as the outside. Black bearded Wheat is to be seen in parts of Hants, but though it yields largely the flour it produces is rough and gritty, and not so sweet as other varieties. The size and bulk of straw is immense. All the early-sown Barley looks well, and the bulk is great, but on middling soils after Wheat (a common Hampshire rotation), the yield is poor. The land bears an analogy to stock; the well-fed and clean animal thrives and escapes many disasters from weather, but the ill-fed are poor, mangy and miserable. So on poor soils or lands lacking manure the crop is poor and light, and more liable by reason of its backwardness to all the ills of blight, smut, and a poor sample as well as yield. Hampshire farmers are late sowers in autumn and spring; but of late years some chosen few follow the golden rule, "When the land is ready the husbandman ought to be ready likewise." But this terrestrial "diagnosis" falls to the lot only of the minority of farmers. Oats are very fine in some districts. The black Tartar on the strong loams of this county are the most prolific as well as the most profitable. We may here observe that there is a general complaint of all the cereal crops, that the straw this year cuts "so dead and dull," and that more "flags" hang about the Wheat stems. All this is true enough, as I narrowly observe all agricultural phenomena from season to season. Peas are not a good crop. Beans an average one. Potatoes sadly diseased, and the tubers very decayed, even when as large as your fist, and six or eight together so on a single root. Swedes mend rapidly, and the late storms have set them onwards in growth. All kinds of cattle look well, and there will soon be plenty of food for them. What the yield of Wheat per acre is this harvest we have yet seen no samples. Much was cut green, and housed green in the straw. As usual all scrambling to make ricks, and the boast how many they have each made when they meet in the market-room; the condition of their ricks seems to be a secondary consideration. *R. S. T., Hants.*

Wester Ross, *August* 20.—Turnip hoeing is all but concluded, and the work has been greatly better performed these last 10 days than it could have been in the previous month. The ground was so thoroughly saturated with the incessant rain that our hoeing, grubbing, and harrowing had only the effect of shifting the weeds from one place to another, the continuous growth being little interrupted. Our Turnips promise well, and as somewhat beyond an average breadth has been sown, the likelihood is, that of this useful commodity there will be no lack. Never did the Potatoes present a gayer or more promising appearance, yet there is not a field in this neighbourhood without unmistakeable symptoms of the damaging presence of that dire disease, and still we have hopes. Its progress is slow, and should that slow step be continued for a fortnight, the earlier kinds at least would be well matured, and what would be saved would be fit for food. Last year the remnant that was saved was well nigh useless. Since dry weather set in, the fields have very hurriedly whitened to the harvest. Last year we commenced operations on the 28th; this year we will commence about the 24th. A few fields in this neighbourhood have been already cut. The crop, on the whole, is rather under an average, and the quantity of straw is greatly less than last year. Wheat on deep well cultivated soils is heavy, but on fields such as this, blight and rust to some extent prevail. On lighter soils Wheat is thin and stinted, but will yield a good sample. Barley that found in spring a suitable seed bed, dry and well pulverised, is luxuriant, but where the soil turned over wet and unbroken, the braird came up thin and starved, and is now an inferior crop. Oats are, with few exceptional fields, light throughout the north. Peas and Beans are grown to a very limited extent in this neighbourhood. Continued high prices have given an additional stimulus to agriculture in the north. Improvements of all kinds, such as trenching, draining, liming, high manuring, are carried on with great spirit, and in this way some security is had against coming days of adversity. Wages of servants and labourers are still on the increase, and although provisions of all sorts are high, no whisper of dissatisfaction is heard.

Notices to Correspondents.

Agricultural Education: *Subscriber*. For Turnip husbandry the best districts of Northumberland, Berwickshire, or East Lothian; for arable dairy husbandry, Ayrshire, Galloway, &c.; for pasture dairy farming, Cheshire, Gloucestershire; for general good arable management, North Lincolnshire, Norfolk, &c. But every county can boast of instances of energetic and intelligent management, in which the circumstances of soil, climate, markets, &c., are perfectly taken advantage of. It is hardly likely, though, that a young man would be admitted without a premium either received or paid on to such farms. He might obtain work and receive wages, and would then be responsible—or he might obtain instruction and pay a premium, and the farmer would then be responsible for his improvement. We doubt if any energetic farmer would be satisfied with any other arrangement than such as would involve distinct services on one side or the other and payment for the same.

Barm: *A B* says C. Clifton has furnished us a method of preparing barm. Will he be so kind as to acquaint us with the quantity of barm required to a given weight of flour? How does he renew his stock when the preparation is exhausted? Does he resort to the original process of manufacture?

Cheese: *J J B.* You will hinder your cheese becoming mity by having new boards for them to lie on, and by keeping them continually clean.

Lime, &c.: *J T B.* We should be disposed to apply at least 40 bushels per acre, now or a month before seed time. The ten bushels per acre as an annual application is proper only after the dressing which a soil needs at first, if it has not been dressed for a long time. If you have arable land you had better apply the compost to it, and let the water improve your irrigated meadow, which it will do unassisted. Pull Thistles, but trust to the water to kill Daisy, Rib-grass, &c.

Pillars of Rickstand: *J G R.* An ordinary height is 30 inches, and the cap overhanging about 10 inches. But mice are carried in the sheaves from the field, and rats seldom fail of having an opportunity once in the season of getting in by something lying carelessly against the rick.

Straw with Green Clover: *Birkenhead* asks for any instances in which this practice has given satisfaction. Mix layers in the rick according to your judgment of the quantity of sap remaining in the Clover. Of course the Clover is dried somewhat, though too green to put together by itself.

Wheat Sowing: *P H.* Loamy soil well drained, in the county of Kent, not exposed to the attacks of game, vermin, &c., may be well seeded with 5 pecks of Wheat per acre, in rows at intervals of 1 foot. In the experiments at Whitfield farm all the intervals from 6 inches to 2 feet, viz., 6, 9, 12, &c., were tried, and the 12-inch interval was most productive.

*** As usual, many communications have been received too late, and others are unavoidably detained till the necessary inquiries can be made.

MAPPIN'S PRUNING KNIVES IN EVERY VARIETY,
Warranted Good by the Makers.

JOSEPH MAPPIN and BROTHERS, Queen's Cutlery Works, Sheffield; and 37, Moorgate Street, London.
Drawings forwarded by post.

REAPING MACHINE.
WILLIAM DRAY and CO.'S Book of Testimonials from purchasers of their Patent Reaping Machines, also a List of Prizes, and full description will be forwarded, post free, on application to
Wm. Dray & Co., Swan Lane, Upper Thames Street, London.

SCYTHES.—Boyd's Patent Self-Adjusting Scythes may be had of the Manufacturers, William Dray & Co., Swan Lane, London, and of all Ironmongers and Seedsmen.
A liberal allowance to the trade.

ROYAL AGRICULTURAL SOCIETY OF ENGLAND.
MEETING AT CARLISLE, JULY, 1855.
First Prize Awarded to
RICHMOND and CHANDLER'S No. 3 B CHAFF MACHINE, Price £7.

All the various modern Implements of Agriculture manufactured on the most scientific and improved principles, suitable for home use and exportation.—Address, Richmond & Chandler, Salford, Manchester; and 32, South John Street, Liverpool.
Catalogues Gratis.

PARKES' STEEL DIGGING FORKS & DRAINING TOOLS.
MESSRS. BURGESS and KEY, as Mr. Parkes' Wholesale Agents for England, have always in stock a large assortment. These Forks and Tools are now in use by upwards of 1000 of the Nobility and Farmers, members of the Royal Agricultural Society, who pronounce them to be the best ever invented, and to facilitate labour at least 20 per cent. Price Lists sent free on application, and Illustrated Catalogue of the best Farm Implements, on receipt of eight postage stamps

"FRIGI DOMO."—Patronised by her Majesty the Queen, the Duke of Northumberland for Syon House, His Grace the Duke of Devonshire for Chiswick Gardens, Professor Lindley for the Horticultural Society, Sir Joseph Paxton for the Crystal Palace, Royal Zoological Society, Mrs. Lawrence, of Ealing Park, and — Collier, Esq., of Dartford.
THE BEST PROTECTOR from the HEAT of the SUN.
"FRIGI DOMO," a Canvas made of patent prepared Hair and Wool, a perfect non-conductor of Heat and Cold, keeping, wherever it is applied, a fixed temperature. It is adapted for all horticultural and floricultural purposes, for preserving Fruits and Flowers from the scorching rays of the sun, from wind, from attacks of insects and from morning frosts. To be had in any required length, 2 yards wide, at 1*s.* 6*d.* per yard run, of Elisha Thomas Archer, whole and sole manufacturer, 7, Trinity Lane, Cannon Street, City, and the Royal Mills, Wandsworth, Surrey; and of all Nurserymen and Seedsmen throughout the kingdom. "It is much cheaper than mats as a covering."

WARNER'S SWING WATER-BARROW
(TO HOLD THIRTY GALLONS)
Is intended for all large Establishments where much watering is done by the watering-pot. By its use much time and labour of the Gardener are saved, particularly where the Tank, Pond, or Pump, is at a distance from the garden. May be obtained of any Ironmonger in town or country for 3*l.* 3*s.*
Manufactured by
John Warner & Sons, 8, Crescent, Jewin Street, London.

JOHN WARNER AND SONS,
Crescent, Jewin Street, London.
GALVANISED IRON TUB GARDEN ENGINE,
With Warner's Registered Spreader,
is strongly recommended, for durability and low price, viz., 2*l.* 19*s.*, to hold 10 gallons. Larger sizes in wood or iron, viz., 14 gals., 24 gals., & 35 gals. May be obtained of any Ironmonger or Plumber in town or country, or of the Patentees and Manufacturers, as also Machinery of all kinds for raising Water from any depth to any height by Steam, Horse, or Manual Power. Prices sent on application. Syringes of various constructions and sizes from 9*s.* upwards. Metallic String from 5*d.* to 1*s.* 3*d.* per lb.

GALVANISED WIRE GAME NETTING,
6*d.* per Yard, 2 Feet Wide.

BARNARD and BISHOP, Market Place, Norwich in consequence of improvements in their machinery for the manufacture of the above article, have been enabled to make a great reduction in the prices.

	Galvanised.	Japanned iron.
2-inch mesh, 24 inches wide	6*d.* per yd.	4½*d.* per yd.
2-inch " strong, do.	8 "	6 "
2-inch " intermediate, do.	9½ "	7½ "
2-inch " extra strong, do.	11 "	9 "
1⅝-inch " 24 inches wide	7 "	5½ "
1⅝-inch " strong, do.	9 "	7 "
1⅝-inch " intermediate, do.	11 "	9 "
1⅝-inch " extra strong, do.	13 "	11 "

All the above kinds can be made of any width (under 8 feet), at proportionate prices. If the upper half is of a coarser mesh than the lower, it will reduce the prices one-fourth.
Strong Galvanised Poultry Netting, 10*d.* per yard; Galvanised Sparrow-proof Netting for Pheasantries, 3*d.* per square foot.
Illustrated Catalogues and Patterns forwarded by post. Delivered free of expense in London, Peterborough, Hull, or Newcastle. Manufacturers of Improved Strained Wire Cattle and Deer Fencing, Iron Hurdles, &c.

CHEAP WIRE, GAME, & POULTRY NETTING
5*d.* per running yard.
GALVANISED DITTO, 7*d.* per running yard, 2 feet wide.

	Galvanised.	Not Galvanised.
24 in. wide, 2 in. mesh,	7*d.* per yard.	5*d.* per yard
30 in. " 2 in. "	9*d.* "	6½*d.* "
36 in. " 2 in. "	10½*d.* "	7½*d.* "
48 in. " 2 in. "	1*s.* 2*d.* "	10*d.* "

Sparrow Proof Netting, Galvanised, 3*d.* per square foot, made to any size for the same proportionate price. This article was shown at the Great Exhibition, where it was so much admired for its light and durable appearance, and acknowledged to be the cheapest and best article of the kind ever offered. Extra strong Wire Sheep Netting, 3 feet high, 1*s.* 6*d.* and 2*s.* 3*d.* per yard. Also every description of Flower Trainers, Dahlia Rods, Garden Arches, Bordering, Flower Stands, Tying Wire, Trellis Work, Invisible Wire Fencing, Hurdles, and every description of Wire Work for Horticultural purposes.—Illustrated Catalogues of Patterns forwarded, post free, on application to T. H. Fox, City of London Wire Work and Iron Fence Manufactory, 44, Skinner Street, and 6 and 8, Snow Hill, London.

212° MILNER'S HOLDFAST AND FIRE-RESISTING SAFES (non-conducting and vapourising), with all the improvements, under their Quadruple Patents of 1840-51-54 and 1855, including their Gunpowder Proof Solid Lock and Door (without which no Safe is secure), the strongest, best, and cheapest safeguards extant.
Milner's Phœnix (212°) Safe Works, Liverpool, the most complete and extensive in the world. Show Rooms, 6 and 8, Lord Street, Liverpool. London Depôt, 47a, Moorgate Street, City.
Circulars free by post.

J. OVERALL begs to inform the Nobility, Gentry, Nurserymen, and others requiring Horticultural Buildings, Lights, and Frames, that by intrusting their orders to him, they may depend upon first-class workmanship and good materials at the most economical prices.

J. OVERALL, Horticultural Builder, 16, Shacklewell Lane, near Kingsland, London.

HOSE PIPING.

WAITHMAN'S PATENT FLAX HOSE PIPING will sustain a greater pressure, is lighter, less bulky, will wear longer, and is about 60 per cent. cheaper than the leather hose pipe.

Manufactured only by WAITHMAN & Co., Bentham, Lancaster.

No. 1 QUALITY, INCHES IN DIAMETER AND PRICE PER YARD:—½, 9d.; ¾, 11d.; 1, 1s. 1d.; 1¼, 1s. 3d.; 1½, 1s. 5d.; 1¾, 1s. 7d.; 2, 1s. 9d.; 2¼, 2s.; 2½, 2s. 3d.; 2¾, 2s. 6d.; 3, 2s. 9d.

SUPER EXTRA STOUT QUALITY:—2, 2s.; 2¼, 2s. 3d.; 2½, 2s. 6d.; 2¾, 2s. 9d.; 3, 3s.

No. 0, a cheaper Hose, to bear a low pressure for Garden and Agricultural purposes, at greatly reduced prices:—1, 9d.; 1¼, 10d. 1½, 11d.; 2, 1s.; 2¼, 1s. 3d.; 2½, 1s. 6d.

The Hose is Burnettised at an extra charge of 3d. per yard.

Union Joints, Branch Pipes, and Jets are also supplied.

COTTAM AND HALLEN have on Show, at their Repository, No. 2, Winsley Street, Oxford Street, London, a great variety of the following articles for the Garden, &c., at very low prices, viz.:—Garden Rollers, Cast-Iron Rickstands, Garden Engines, Mowing Machines, Garden Chairs, Superior Garden Tools of all kinds, Garden Vases and Pedestals in great variety, and a large assortment of Horticultural and Agricultural Implements.

Ornamental Wire Flower Stands, Pot Trainers, Rose Tree Guards, Flower Bordering, and every description of Wire Work, both plain and ornamental.

Hand Glass Frames, Cast and Wrought Iron Flower Stakes, Garden Arches, &c.

Strong Iron Hurdles, and best Wire for Strained Wire Fencing.

Hothouses, Conservatories, &c., made upon the most improved principle, either of Iron, or of Iron and Wood combined, which can be fixed complete, with Hot Water Apparatus, in any part of the Kingdom. Show Rooms at the Manufactory, 2, Winsley Street, Oxford Street, opposite the Pantheon, where every information may be obtained.

CHASE'S BEETLE POISON,

ENTIRELY FREE FROM DANGER TO HUMAN LIFE, AND PERFECTLY HARMLESS TO CATS AND DOGS.

A Safe and most Effectual Destroyer of Black Beetles and Cockroaches; one trial alone will suffice to prove its great efficacy, and one box will destroy thousands. The great advantage in this preparation is that it does not leave their bodies to decay and corrupt the air, but completely dries up and destroys them, so that nothing is left to cause an unpleasant odour when dead.

Directions for use: Place four or five of the Balls each night where the Beetles mostly resort.

Sold in boxes at 1s. each, or sent free to any part of the kingdom for 20 stamps, by THOMAS CHASE, Chemist, 14, Holborn (opposite Furnival's Inn), London. And may be obtained through all medicine vendors.

To the Editor of the "Cottage Gardener," July 3d, 1855.

"Some of your readers may be glad to hear of an effectual poison for these disagreeable pests. I have succeeded in completely clearing my house of them by the use of Chase's Beetle Preparation (14, Holborn). I recommend those who are troubled with these insects to place the pills in every place in the house haunted by them, and to repeat the application twice after intervals of 10 days; by this means the successional crops of young beetles are destroyed."—*C. W. J., Croydon.*

(ED.—This is not a mere puff, but sent to us by a gentleman who has been benefited as he states.)

TOURISTS, TRAVELLERS, AND OTHERS,
EXPOSED TO THE SCORCHING RAYS OF THE SUN, AND HEATED PARTICLES OF DUST, WILL FIND

ROWLAND'S KALYDOR a most refreshing preparation for the Complexion, dispelling the cloud of languor and relaxation, allaying all heat and irritability, and immediately affording the pleasing sensation attending restored elasticity and healthful state of the skin. Freckles, Tan, Spots, Pimples, Flushes, and Discoloration fly before its application, and give place to delicate clearness, with the glow of beauty and of bloom. In cases of sunburn or stings of insects, its virtues have long been acknowledged. Price 4s. 6d. and 8s. 6d. per bottle.

ROWLAND'S MACASSAR OIL, a delightfully fragrant and transparent preparation, and as an invigorator and purifier beyond all precedent.

ROWLAND'S ODONTO, OR PEARL DENTIFRICE, a White Powder, compounded of the rarest and most fragrant exotics. It bestows on the teeth a pearl-like whiteness, frees them from Tartar, and imparts to the Gums a healthy firmness, and to the breath a grateful sweetness and purity.

Sold by A. ROWLAND & SONS, 20, Hatton Garden, London; and by Chemists and Perfumers.

DO YOU WANT LUXURIANT HAIR, WHISKERS, &c.?—The most marvellous production of modern date is ROSALIE COUPELLE'S CRINUTRIAR, which is guaranteed to produce Whiskers, Moustachios, Eyebrows, &c., in a few weeks, and restore the Hair in baldness from whatever cause, strengthen it when weak, prevent its falling off, and effectually checks greyness in all its stages. For the nursery it is recommended by upwards of 100 physicians, for promoting a fine healthy head of hair, and averting baldness in after years. Sold by all Chemists and Perfumers, price 2s., or will be sent post free on receipt of 24 penny stamps, by Miss COUPELLE, 69, Castle Street, Newman Street, Oxford Street, London. Mrs. CARTER writes, "My head, which was bald, is now covered with new hair." Mrs. WILLIAMS—"I can show a fine head of hair from using your Crinutriar." Mrs. REEVE—"My hair is gaining strength and thickness." Sergeant CRAVEN——"Through using it I have an excellent Moustache." Mr. YATES—"The young man has now a good pair of whiskers. I want two packets for other customers."

A HANDSOME PORTABLE BAROMETER FOR 21s.

HENRY BAKER calls the attention of the public to his Improved MODEL BAROMETER, made of solid Rosewood and mounted with Ivory Plates, with a Thermometer. The above Instrument for Accuracy and Style stands unrivalled; it is Portable, and WARRANTED to perform well; and being manufactured on the premises, it is highly recommended. Can be sent into the country without risk of breakage for 1s. extra.

HENRY BAKER, Instrument Maker to the Board of Admiralty, 90, Hatton Garden, London.

ONE THOUSAND BEDSTEADS TO CHOOSE FROM.—HEAL AND SON have just erected extensive Premises, which enable them to keep upwards of 1000 Bedsteads in stock, 150 of which are fixed for inspection, comprising every variety of Brass, Wood, and Iron, with Chintz and Damask Furnitures complete. Their new Warerooms also contain an assortment of BED-ROOM FURNITURE, which comprises every requisite, from the plainest japanned deal for servants' rooms, to the newest and most tasteful designs in mahogany and other woods. The whole warranted of the soundest and best manufacture. HEAL AND SON'S ILLUSTRATED CATALOGUE OF BEDSTEADS AND PRICED LIST OF BEDDING sent free by post.—HEAL AND SON, 196, Tottenham Court Road.

METCALFE, BINGLEY, AND CO.'S OATMEAL and CAMPHOR SOAP, in tablets (registered Nov. 3, 1854). Price 6d. each. This soap will be found the purest and most perfect winter soap ever introduced to the public. It preserves the hands from chapping, and renders the skin soft and agreeable.—Sold wholesale and retail by the inventors and sole manufacturers, METCALFE, BINGLEY, & Co., Brushmakers and Perfumers to H.R.H. Prince Albert, 130B and 131, Oxford Street.

CAUTION.—To prevent fraud, each tablet bears the registered mark and the names and address of the inventors, as above.

METCALFE'S ALKALINE TOOTH POWDER, 2s. per box.—The above may be obtained of most respectable Chemists, Perfumers, &c.

WHITTINGTON NURSERY, HOLLOWAY, ISLINGTON.—The above Nursery, with 2 Acres of ground well stocked with Evergreens (for which it is noted), with Dwelling House and Shop, Two Greenhouses and Plants, with Sheds, and every other convenience for carrying on the above business, held by the owner for the term of 99 years, 57 years of which remains unexpired at a ground rent.

TO BE SOLD, by Private Contract, a Small ORNAMENTAL CONSERVATORY, nearly new, a Ten-light GREENHOUSE, lights and framework complete; also a Six-light MELON-PIT, including brickwork, &c., and several One and Two-light CUCUMBER-FRAMES in good working order. The whole the property of a gentleman who has no further use for them.—Apply to J. CUNNINGHAM, 2, Bute Street, Old Brompton, Middlesex.

TO BE SOLD, a CONSERVATORY, 20 feet long, 11 feet wide; likewise several small GREENHOUSES.—Address to Mr. SMITH, Greenhouse Builder, Painter, and Decorator, 4, Canonbury Cottages, Lower Road, Islington.

☞ Greenhouse Lights and Window Sashes made and glazed at 8d. per foot, and all kinds of Joiners' Work Estimated for. Reference given.

SHROPSHIRE RAMS.

TO BE SOLD, two superior SHEARLING RAMS of the above breed, from the stock of Mr. Foster, near Stourbridge, who obtained a prize at the Gloster Meeting. They are bred by the owner, and are more than he requires for his use. The farm is a high dry sheep farm, and the Rams have been kept with the ordinary stock, where a large flock is run. The price Ten Guineas each, delivered free to the Exeter Station.—Address R. W. GIBBONS, Abbot's Hill, Beaford, Devon.

Sales by Auction.

ORCHIDS.

MR. J. C. STEVENS is favoured with instructions to Sell by Auction at his Great Room, 38, King Street, Covent Garden, on WEDNESDAY, 12th September, at 1 o'clock precisely, a most important and valuable collection of ORCHIDS, the property of ROBERT HANBURY, Esq., consisting of all the best varieties of Ærides, Saccolabiums, Vandas, Cattleyas, &c., in fine specimens.—May be viewed on the morning of Sale, and Catalogues had.

EALING PARK.

THE LATE MRS. LAWRENCE'S RENOWNED COLLECTION OF PLANTS.

MR. J. C. STEVENS is favoured with instructions to Sell by Auction, at the Gardens of Ealing Park, on THURSDAY, September 20, and two following days, at 1 o'clock precisely, the whole of the PLANTS contained in the 15 Stoves and Greenhouses at Ealing Park, comprising about 1200 specimens of the choicest Exotics, Heaths, Camellias, Azaleas, &c. This unrivalled collection is in the best condition, the cultivation having been for some years past under the able superintendence of Mr. William May, whose ability as a grower of specimen plants is proverbial.—Catalogues (which are preparing) will be ready about ten days before the sale, and may be had of Mr. J. C. STEVENS, 38, King Street, Covent Garden. (Four stamps if prepaid).

ROTHERHITHE, SURREY.

TO MARKET-GARDENERS, NURSERYMEN, AND OTHERS.

MR. W. T. ATTWOOD has received instructions to sell by Auction, without reserve, on the premises, Lower Road, Rotherhithe, on THURSDAY, Sept 20, at 12 o'clock, the Live and Dead STOCK and CROP of a Market Gardener, comprising about 20,000 roots of Linnæus, Victoria, and other Rhubarb, 2 acres 2 roods of Horseradish in crop, 15,000 yearling Seakale plants, 2 roods of young Mint, a quantity of Potatoes and other crops; also 30 3-light Boxes and Lights, 200 Hand-glasses, useful Cart Horse, light Market Cart on springs and other carts, Baskets, Implements, Tools, &c.; 300 loads of good rotten Manure.—May be viewed previously to sale. Catalogues may be had at the Inns in the neighbourhood, Inns in Covent Garden Market, and of Mr. ATTWOOD, Auctioneer and Land Agent, Mortlake, Surrey.

COLESHILL, BERKS.

IMPORTANT SALE OF HEREFORD CATTLE & SOUTH-DOWN SHEEP.

MESSRS. FIDEL AND DYKE have been directed by Mr. Moore to offer to public competition, on FRIDAY, the 14th of September, at 12 for 1 o'clock, on the premises at Coleshill, the valuable Herd of 70 HEREFORD BULLS, COWS, HEIFERS, and CALVES, and also 176 pure SOUTH-DOWN BREEDING EWES and THEAVES belonging to the Right Honourable the Earl of Radnor. This Herd has been bred with the greatest care from some of the best herds in the counties of Hereford and Salop, and with an infusion of the best blood from the herds of the late Earl Talbot and Sir F. Lawley. It includes animals which have taken prizes at Smithfield and Lincoln; also the Bull which took the second prize at Carlisle, in a class which had ten competitors, and was allowed by the Judges to be the best lot ever exhibited. The Sheep are also of a superior character, and are bred from the flocks of Messrs. Jonas Webb, Northeast, and Sainsbury. — Catalogues with pedigrees will be published immediately, and may be had of the Auctioneers, Faringdon, Berks: or at the place of sale.

Coleshill is four miles from the Shrivenham and eight from the Swindon stations on the Great Western Railway.

London: LONGMAN, BROWN, GREEN, & LONGMANS.

NEW AND ENLARGED EDITION OF DR. LINDLEY'S THEORY OF HORTICULTURE.

Just Published, in 8vo, with 98 Woodcuts, price 21*s.* cloth,

THE THEORY AND PRACTICE OF HORTICULTURE; or, an Attempt to explain the chief Operations of Gardening upon Physiological Grounds: being the Second Edition of the "Theory of Horticulture," much enlarged. By JOHN LINDLEY, Ph.D., F.R.S., Corresponding Member of the Institute, Vice-Secretary of the Horticultural Society, Professor of Botany in University College, London, &c.

"The First Edition of this valuable work was issued in 1840, since which time it has had an extensive circulation, and has been translated into the German, Dutch, and even Russian languages. Being more particularly restricted to principles, however, the author at length resolved to render the work more generally interesting and useful by a more frequent reference to practical operations. He has thus greatly extended the matter, by supporting the physiological doctrines with an appeal to facts familiar to cultivators, or which ought to be; and the result is a still more interesting and popular compendium of the principles and practice, or the science and art, of horticulture."—*Builder.*

"This is a Second Edition of the "Theory of Horticulture," with the addition of a large quantity of practical matter, introduced to show how entirely scientific principles and good cultivation correspond. The volume contains about four times as much matter as the first edition . . . . Although very large additions are made to every chapter, while many passages in the first edition have been wholly struck out, it may be proper to say that the greatest changes are those which relate to vitality, climate, domestication, ventilation, propagation, pruning, resting, and soils and manures; such being the subjects in which practical men are most interested. The whole work has, indeed, assumed such a form as to make it evident that the great object of the author has been, not to produce a work suited to men of science, but one which every well informed gardener may understand and apply. As the volume concludes with a very copious index of matter, there is no difficulty in ascertaining where any given subject is treated of."—*Gardeners' Chronicle.*

By the same Author,

INTRODUCTION TO BOTANY. 4th Edition, greatly enlarged; with 6 Plates, and numerous Wood Engravings. Two vols. 8vo, 24*s.*

*** It has been the Author's wish to bring every subject that he has introduced down, as nearly as possible, to the state in which it is found at the present day. In doing so, he has added so very considerable a quantity of new matter, especially in what relates to Vegetable Anatomy and Physiology, that the present Edition may be considered, in those respects, a new work.

London: LONGMAN, BROWN, GREEN, & LONGMANS.

THE TARIFFS OF ALL NATIONS.

Now ready, One Volume Quarto, 30*s.*,

A COLLECTION OF THE CUSTOMS' TARIFFS OF ALL NATIONS: Based upon a Translation of the Work by M. HUBNER. Augmented by additional information, brought up to the year 1855. By C. N. NEWDEGATE, M.P.

"Mr. Newdegate, after vainly attempting to induce Government to extend and improve the publication of commercial statistics, has himself collected and published the tariffs of various nations, in redemption of a voluntary pledge he gave in the House of Commons."—*Spectator.*

"Among recent commercial publications has been a valuable and elaborate one by Mr. Newdegate, the Member for North Warwickshire, consisting of a Collection of the Customs Tariffs of all Nations, brought down to the end of last year, and arranged upon the principle of the work supplied to the Prussian Government in 1852, by M. Otto Hubner."—*Times' City Article.*

JOHN MURRAY, Albemarle Street.

HEBERT, 88, Cheapside, London. Editor's Offices (Offices for Patents), 47, Lincoln's Inn Fields, London; and 166, Buchanan Street, Glasgow.

MORTON'S NEW FARMER'S ALMANAC.

Early in November will be Published,

A NEW FARMER'S ALMANAC. Price 1*s.* By JOHN C. MORTON, Editor of the "Agricultural Gazette," the "Cyclopedia of Agriculture," &c.

Along with the usual contents of an Almanac, it will include:—1. Monthly directions for the operations of the Farm and Garden. 2. Short notices of the past year's Agricultural novelties and progress. 3. Such an Index to current Agricultural Literature as will direct the student to sources of information on the principal Agricultural topics. 4. A list of the more important of those well-established facts in Farm experience, which may serve as trustworthy data in Agricultural Estimates and Calculations. 5. Short references to the treatment proper under the more common Diseases to which Farm Stock are liable. 6. A series of Instructions and Receipts in many particulars of Household, Garden, Field, and Dairy Management. 7. A guide to the more important of our Fairs and Markets, with information as to times and places where the different kinds and breeds of Stock may be best obtained. 8. An index to the Meetings, Office-bearers, and objects of our principal Agricultural Societies and Farmers' Clubs.

The object throughout will be, by good arrangement and close packing, to furnish as much Agricultural information of practical usefulness as can be issued by the printer and the publisher for 1*s.*

London: BLACKIE & SON, Warwick Square; and Glasgow and Edinburgh.

PARIS.

STANFORD'S NEW GUIDE TO PARIS AND THE PARIS EXHIBITION, with two Maps and a View of the Exhibition and Champs Elysées, is just Published, price 2*s.* 6*d.*; per post, 2*s.* 10*d.*

London: EDWARD STANFORD, 6, Charing Cross. Edinburgh: A. & C. BLACK. Paris: LONGUET, 8, Rue de la Paix. And all Booksellers.

TO ADVERTISERS.

THE SOUTH-EASTERN GAZETTE, a Family, Commercial, and Agricultural Newspaper, which has a circulation exceeding 3300 copies weekly, has been at the head of the Kentish Press for 20 years, for the past five years has had double the circulation, and, as shown by the official stamp returns to July 1, 1855, has now three times the circulation of the next highest, and nearly five times that of any other Newspaper in Kent. It has a larger circulation than the whole of the papers published in East Kent together, and also than the whole of those published in West Kent.—Published every Tuesday, price 5*d.*, stamped, 4*d.* unstamped, at the Offices, 27, Week Street, Maidstone, and 21, High Street, Canterbury.—Maidstone, Sept. 1.

NO CHARGE FOR STAMPING at LOCKWOOD'S, 75, New Bond Street. Good cream-laid Note-paper, five quires for 9*d.*; Thick ditto, five quires, 1*s.*; Albert and Queen's sizes, five quires for 6*d.*, 9*d.*, and 1*s.*; Note-paper made from Straw, 2*s.* 6*d.* per ream; Envelopes, 4*d.* to 1*s.* 6*d.* per hundred; Foolscap paper, 7*s.* 6*d.* per ream; Copybooks 2*s.* 6*d.* per dozen. Card Plate engraved, 2*s.* 6*d.*; 100 Cards printed, 2*s.* 6*d.* Wedding orders promptly executed. A large variety of Writing and Dressing Cases, Envelope Boxes, Blotting Books, Inkstands.—Copy address, LOCKWOOD'S, 75, New Bond Street. Country orders for 20*s.* sent carriage free. LOCKWOOD'S celebrated Nugget (Gilt) Pen, 1 doz. post free for 13 stamps.

HOW TO KILL RATS, MICE, AND MOLES BY HUNDREDS.—A method will be forwarded with instructions for 30 postage stamps, which will destroy the above vermin quickly and without trouble. 1000 Acres may be cleared for a few shillings.—GILBERT DYSON, Hoo, Rochester.

HOW TO KILL RATS AND MICE BY HUNDREDS.—A Receipt may be had, honestly worth 20*l.*, without trouble, by sending 30 postage stamps and a directed envelope to Mr. WILLIAM FRANKLIN, Post-office Street, Norwich, who will forward it with plain instructions, &c. This is a most extraordinary remedy, such as no Farmer, Merchant, or Miller ought to be without, as it will save them pounds yearly by killing every Rat or Mouse either in the field, stack, or house.

WASPS! WASPS!—The finest FRUIT in England will be secured from Wasps, Flies, Birds, &c., by using HAYTHORN'S HEXAGON GARDEN NET, to be seen in most Gardens. Patterns, prices, and testimonials free by post. Orders directed to Mr. HAYTHORN, Nottingham, will have immediate attention.

MARQUEES ON HIRE TO SUIT THE TIMES.—Length, 50 ft.; width, 30 ft.; price 3*l.* 70 by 30 ft., 4*l.*; 110 by 30 ft., 5*l.* Larger and smaller ones in proportion. These Marquees are nearly new and very lofty. All kinds of Tents for Emigrants, Cricketers, Gardens, &c.—R. RICHARDSON, Tent Maker, 21, Tonbridge Place, New Road, London.

TO BRICKMAKERS.

CLAY GROUND AND STOCK BRICKS made at one and the same time, with ease, by One Horse, at the rate of from Eight to Ten Bricks the minute. Price of Machine at Hull, 35*l.* Reference given and particulars forwarded.—Apply to W. HODSON, Patentee, Kingston Square, Assembly Rooms, Hull.

FILTRATION BY ASCENSION.

FREDK. RANSOME & CO., sole Patentees of the New AUTOMATON PURIFIER; also manufacturers of every variety of FILTERS (Portable or for Immersion) fitted with the Patent Purifying Medium. Pure Water, in any quantities, for Water Companies, Manufacturers, and others, obtained at a very moderate cost by the use of RANSOME'S Filtering Slabs. An Illustrated Priced List on application to the Depôt, Whitehall Wharf, Cannon Row, Westminster, or at the Patent Stone Works, Ipswich. A liberal discount allowed to the Trade. Filter Manufacturers and Exporters supplied with RANSOME'S Patent Filtering Medium separately, on the lowest terms.

FREDK. RANSOME & Co. are also the Patentees and sole Manufacturers of the Patent "Iris Fountains" for Drawing Rooms, Conservatories, &c.

RANSOME'S SILICEOUS STONE.

THE PATENT SILICEOUS STONE COMPANY are prepared to execute Contracts for the supply of all kinds of Ornamental Details for Buildings, &c., manufactured in this beautiful material, which has received the approval of eminent architects and scientific men, and which for sharpness of outline, durability, and cheapness, stands unrivalled. It is especially applicable for the elaborate details of Mediæval and Ecclesiastical Architecture, for Gothic Windows, Doorways, Pinnacles, &c.; Crosses, Corbels, Altar Screens, Pulpits, Fonts, Monumental Tombs, Tablets, Headstones, &c; also for all kinds of Garden Decorations, Fountains, Figures, Vases, and Pedestals; Flower Boxes, Wardean Cases, Balustrades for Terrace Walks, Gate Piers, Caps, Bases, &c. &c.; and for Coats of Royal Arms, Chimney Pieces, Brackets and Trusses, Ashlars, Quoins, String Courses, and other Dressings.—Further particulars, with illustrations, on application to Mr. EDWD. MENDHAM, Secretary, at the Company's Offices, Whitehall Wharf, Cannon Row, Westminster; or to Mr. FREDK. RANSOME, Patent Stone Works, Ipswich.

Printed by WILLIAM BRADBURY, of No. 13, Upper Woburn Place, and FREDERICK MULLETT EVANS, of No. 20, Queen's Road, West, both in the Parish of St. Pancras, and in the County of Middlesex, Printers, at their Office in Lombard Street, in the Precinct of Whitefriars, in the City of London; and published by them at the Office, No. 5, Upper Wellington Street, in the Parish of St. Paul's, Covent Garden, in the said County, where all Advertisements and Communications are to be ADDRESSED TO THE EDITOR.—SATURDAY, September 1, 1855.

A MEETING OF THE BRITISH POMOLOGICAL SOCIETY will be held at the Rooms, 20, Bedford Street, Covent Garden, on MONDAY, September 17th, at 1 o'clock, for examining and reporting upon collections of Fruit; and it is hoped that all who take an interest in the cultivation of Fruits and Fruit trees will aid the Society by sending such specimens of Fruits as they can command. Persons desirous of being elected members are requested to make application to the Secretary, to whom also all packages are to be addressed,

ROBERT HOGG, Secretary.

NORTH LONDON FLORICULTURAL SOCIETY.—An EXHIBITION of Dahlias, Fuchsias, Verbenas, and Miscellaneous Plants, open to all England, will be held under the auspices of this Society, in the Penton Rooms, Pentonville, on WEDNESDAY, Sept. 19th. Omnibuses every five minutes from the North-Eastern, London Bridge, Great Western, North Western, and Great Northern Railways, pass within a few yards of the Exhibition, which promises to be one of the most attractive metropolitan displays of the season. Seedling productions will be furnished in great abundance by all the best raisers; lovers of novelty may, therefore, make sure of a treat.—For Schedules, tickets, &c., apply to GEORGE SMITH, Hon. Sec.

Tollington Nursery, Hornsey Road, Islington.

SOUTH LONDON SOCIETY OF AMATEUR FLORISTS.—THE FIFTH EXHIBITION of the above Society will be held at the Horns Tavern, Kennington, on WEDNESDAY, 19th September, when Prizes will be awarded to Miscellaneous Plants, Dahlias and Fancy varieties, Verbenas in pots and cut trusses, &c. &c. An efficient Band will be in attendance. Admission to Non-members from 2 till 7 o'clock at 6*d*. each. List of Prizes, and the Rules for Exhibitors, may be obtained from JOHN BUSHELL, Hon. Sec.

Lower Kennington Lane, Lambeth.

WILLIAM BARRATT, LANDSCAPE GARDENER, Wakefield.

*** Plans and Estimates furnished.

TRIFOLIUM, fine home-grown, per lb. ... 0*s*. 8*d*.
ITALIAN RYE-GRASS, fine imported, per bushel, 5s. to ... 5 6
MUSTARD, per bushel ... 12 0

B. PAGE AND CO. can supply fine samples of the above at their usual strict Farmers' prices.

Oxford Street Seed Stores, Southampton.

"A LIST OF PLANTS," including RARE and HARDY CONIFERS, HARDY ORNAMENTAL SHRUBS and CLIMBERS, GREENHOUSE PLANTS, ERICAS, EPACRIS, CAMELLIAS, GERANIUMS, CARNATIONS, PICOTEES and PINKS, HOLLYHOCKS, PHLOXES, CHRYSANTHEMUMS, HARDY HERBACEOUS PLANTS, &c.

Cultivated and Sold by YOUELL and Co., Royal Nursery, Yarmouth, Norfolk, is now ready, and will be forwarded on receipt of two postage stamps.

NURSERY STOCK.

H. BIGLAND AND CO. beg to state that the LEASE of their NURSERY having now expired, they have concluded to offer the remainder of their STOCK (consisting of Evergreens, Fruit, and Forest Trees, Greenhouses, &c.) by Auction this autumn; the precise time will be named in a future Advertisement.

Britannia Nursery, Whalley Range, Manchester.

WANTED IMMEDIATELY, about 20 FRUITING and 30 SUCCESSION PINE PLANTS, of the following varieties, viz.:—Queens, Providence, Jamaica, and Cayenne. They must be clean, healthy, and very strong plants.—Address, with prices, to W. W. P., Post Office, Newent, near Gloucester.

WANTED, a quantity of BLACK JAMAICA and QUEEN PINES, either suckers or rooted plants that will fruit next year. They must be clean. This would be a good opportunity for any one giving up business to dispose of the whole stock. Also a quantity of the Coniferæ, particularly of the Deodar and of Araucarias; also Seeds of the Coniferæ. Terms, cash.—Address, with prices, F. M., Office of this Paper.

WANTED,

GRAPES AND PEACHES OF SUPERIOR QUALITY. Forward to GEORGE TAYLOR, JUN., FRUIT SALESMAN, St. John's Market, Liverpool. Terms CASH.

GRAPES.

TO BE SOLD, a House of BLACK HAMBURGH GRAPES, of good quality.—J. H., Post Office, Epsom.

TO BE SOLD, the LODDIGES' COLLECTION OF ORCHIDS.—This unrivalled collection containing upwards of 1200 species and 2000 specimens (many of which are unique), in the finest possible health, is now to be disposed of in one Lot, affording an opportunity to any nobleman or gentleman desirous of commencing the cultivation of this beautiful tribe of plants which has never before occurred.—For terms and to view apply to C. LODDIGES, Hackney.

FOR PRESENT SOWING.

NEW ITALIAN RYE-GRASS AND TRIFOLIUM INCARNATUM SEED MAY NOW BE OBTAINED FROM SUTTON AND SONS, SEED GROWERS, Reading, Berks.

Remittances or references are requested from unknown correspondents.

SUTTON'S RENOVATING GRASS SEEDS MAY NOW BE SOWN.—The Grass Lands sown with these Seeds last Spring are greatly improved (*vide* letters recently received).

Price of Seed 9*d*. per lb., or 80*s*. per cwt. Quantity required, 8 to 12 lbs. per acre.

HYACINTHS AND OTHER BULBS JUST IMPORTED BY SUTTON AND SONS, SEED GROWERS, Reading, Berks.—This is a superior assortment of Bulbs, and will be sent out carriage free (except small parcels), at very moderate prices. A List may be had post free.

DUTCH HYACINTHS AND OTHER BULBS.

J. AND J. FRASER beg to announce that they have received their annual importation of HYACINTHS and other FLOWER ROOTS, of which a descriptive Catalogue may be had by enclosing one postage stamp. This Catalogue contains some instructions for the successful cultivation of the various roots.—Lea Bridge Road, Sept. 8.

DUTCH HYACINTHS, ETC.

CLAPHAM.

CHARLES SOUTHBY, late FAIRBAIRN, Seedsman, &c., begs to inform the kind Patrons of the late JOSEPH FAIRBAIRN that he has received an importation of the above, which are particularly fine this season, and in very good condition. Priced catalogues can be had postage free on application.—High Street, Sept. 8.

DUTCH FLOWERING BULBS.

JAMES CARTER AND CO.'s comprehensive CATALOGUE of DUTCH and CAPE BULBS and SEEDS for Autumn sowing, is now published, and will be forwarded free of charge and post paid upon application to JAMES CARTER & Co., 238, High Holborn, London.

DUTCH FLOWERING BULBS.

HENRY WALTON'S CATALOGUE of DUTCH and other BULBS is now in course of preparation, and may be had as soon as ready on receipt of one postage stamp. Apply, HENRY WALTON, Florist, &c, Edge End, Marsden, near Burnley, Lancashire.

H. W. can also supply all the new White Corolla'd and other new Fuchsias at 18*s*. and 21*s*. per doz., or 2*s*. 6*d*. to 3*s*. 6*d* each. New Verbenas, 15*s*. per doz., or 1*s*. 6*d*. each. See advertisements in previous *Gardeners' Chronicles*.

DUTCH FLOWER ROOTS.

JAMES DICKSON AND SONS beg to intimate that they have received their First Annual Importation of HYACINTHS, and every other variety of DUTCH BULBS, in fine condition, and of the first quality.—Nursery and Seed Warehouse, 32, South Hanover Street, Edinburgh. Catalogues forwarded on application.—Sept. 8.

DUTCH FLOWER ROOTS, ETC. ETC.

PETER LAWSON AND SON, SEEDSMEN AND NURSERYMEN TO HER MAJESTY THE QUEEN, and to the Highland and Agricultural Society of Scotland, beg to intimate the arrival of their first assortment of DUTCH FLOWER ROOTS, Catalogues of which may be had, free, on application, and orders for which are respectfully solicited,

They have also on hand very select stocks of foreign Italian Rye-grass, Crimson Clover (Trifolium incarnatum), Alsike Clover (Trifolium hybridum), Dwarf Essex Rape, Winter Tares, Stubble Turnip, &c. &c.

London: 27, Great George Street, Westminster.—Sept. 8.

WILLIAM CUTBUSH AND SON beg to acquaint their patrons and friends that their ANNUAL CATALOGUE of DUTCH BULBS can be had, postage free, on application. The superior quality of their roots is well known, but as a further guarantee they obtained the Awards at the Horticultural Society's Rooms, Regent Street, last spring.

Highgate Nurseries, near London.

DUTCH BULBS.

JAMES VEITCH, JUNIOR, Exotic Nursery, Chelsea, begs to announce that he has received his annual supply of BULBOUS ROOTS from Holland, and is pleased to say that they are particularly fine and in excellent condition. Catalogues are now ready, and will be forwarded on application.

N.B. J. V. Jun., desires to impress on those who patronise him the great advantage of giving him their orders early, as the successful cultivation of Bulbs depends in great measure on their being planted early in the season.—Sept. 8.

DUTCH BULBS AND FLOWER ROOTS.

THOMAS JACKSON AND SON respectfully inform their patrons and the public that they have received in the finest condition their annual consignment of Bulbs and Roots, and that they are of the largest size and very finest quality. Good Double Hyacinths 4*s*. per dozen; mixed Polyanthus Narcissus, 3*s*. per dozen; Double Roman Narcissus, 4*s*. per dozen. Their Priced List of Bulbs, &c., and also their General Priced Catalogue of Stove, Orchidaceous, Greenhouse Plants, Ornamental Shrubs and Trees, and Herbaceous Plants may be obtained on application.—Nurseries, Kingston, Surrey.

IMPORTED DUTCH FLOWER ROOTS.

T. F. WINSTANLEY begs to announce that his Priced Catalogue of Dutch Bulbs for the present season will shortly be ready, and can be had free on application. It contains a list of all the newest and leading sorts in cultivation, including Hyacinths, Narcissus, Jonquils, Amaryllis, Early Single and Double Tulips, Crocus, &c., all of which have been grown by one of the first growers in Holland, and can be relied upon as being good sound Bulbs, and true to name.

28, Market Place, Manchester.

DOUBLE ROMAN AND PAPER WHITE NARCISSUS, 4*s*. per dozen.—The above Bulbs, the former of which is so justly esteemed for its early blooming and excessive fragrance, and the latter for its purity and elegance, have just arrived, and may be obtained at A. CORBETT's Italian and Foreign Warehouse, 18, Pall Mall, near Waterloo Place, London.

NEW SEEDS.—GROWTH OF 1855.

WILLIAM E. RENDLE AND Co, SEED MERCHANTS, Plymouth, are now harvesting in fine condition their General Collection of Agricultural and Garden Seeds for the coming season.

In order to give increased facilities for conducting their Seed Business, they are now considerably enlarging their offices and warehouses, which, when completed, will enable them to attend to all orders with promptness and despatch.

WILLIAM E. RENDLE & Co, Seed Merchants, Plymouth. Established 1786.

FLOWER SEEDS FOR PRESENT SOWING.

BASS AND BROWN'S superior Selected Seeds per packet, as under:—

CALCEOLARIA, choice, 1*s*. From new vars. of our superb Collection. Extra 2*s*. 6*d*.—GERANIUM, choice, 1*s*. Extra from new vars. of our superb Collection, 2*s*. 6*d*.—GLOXINIA, choice, 6*d*. Extra from new vars. of our superb Collections, 2*s*. 6*d*.—VERBENA, choice, 1*s*. Extra from new vars. of our superb Collection, 2*s*. 6*d*.—CARNATIONS, extra from 400 vars., 2*s*. 6*d*.

For a variety of other choice seeds for present sowing see advertisement in *Gardeners' Chronicle*, August 18.

Seed and Horticultural Establishment, Sudbury, Suffolk.

DICKINSON'S ITALIAN RYE-GRASS SEED is now ready for delivery, for present payment only, 7*s*. per bushel.—New Park, Lymington, Hants.

SKIRVING'S NEW PURPLE-TOP'D SWEDE.—A prime lot of Seed just harvested. For price apply to W. BURGESS, Iden, near Rye.

FINE FRINGED CHINESE PRIMROSE.

J. AND J. FRASER beg to offer some excellent Seed of the above, saved from plants which obtained the award of the Horticultural Society last winter, in packets at 2*s*. 6*d*. each.

A remittance in stamps is requested from unknown correspondents.—Lea Bridge Road, Sept. 8.

FERNS.

ROBERT SIM'S 16 page CATALOGUE of his GENERAL COLLECTION of FERNS may now be had for Four Stamps. Free to all previous purchasers.

Nursery, Foot's Cray, Kent.

TO THE SEED TRADE.

GEORGE TABER, of Ravenhill, Essex, begs to inform the Trade that his growing crops of Seeds are now open to inspection. All Turnip Seeds grown from sound transplanted roots. Lists sent on application.—Sept. 8.

CAMELLIAS, ETC.

CHANDLER AND SONS, NURSERY, Wandsworth Road, beg to inform their friends and customers that their Camellias are finely set with flower buds this season; they are now sending out good bushy plants from 30*s*. and upwards per dozen. The best Chrysanthemums, 12*s*. per dozen. Also a great variety of Ornamental Plants for furnishing conservatories, at reasonable prices.

TO GENTLEMEN PLANTING.

CHANDLER AND SONS, NURSERYMEN, Wandsworth Road, have a quantity of fine Green and Variegated HOLLIES, ARBORVITÆ, BOX, LAURELS, RHODODENDRONS, AZALEAS, WHITE AND PURPLE LILACS, &c., all of a large size, in a fit state for transplanting, and at very moderate prices.

CALCEOLARIA.

JOHN CATTELL is still sending out seed of very superior Calceolaria, saved from the finest varieties: Major's and other growers, carefully hybridized, 2*s*. 6*d*. per packet. Ditto, saved from an entirely new class to any hitherto sent out by J. C., having very large flowers, with distinct and splendid colours, extra free bloomers, 5*s*. per packet.

The other seeds advertised in the *Gardeners' Chronicle*, Aug. 4th, and following numbers, may still be had.

Nurseries, Westerham, Kent.

TREE CARNATION.

J. WADSON begs leave to call attention to his advertisement which appeared in the *Gardeners' Chronicle* of August 25, page 563, and the "Cottage Gardener" of the 4th instant.

J. W. has no objection to take in exchange for the above Rose Scent, Double White Primula, Camellias, &c.

Albion Road, Hammersmith.

R. SMITH still continues to send out strong runners of his SEEDLING STRAWBERRY, SIR CHARLES NAPIER, which this season has proved itself good; both for forcing and natural it has no equal. Price 2*l*. per 100.

R. SMITH, Market Gardener, Twickenham.

BARRATT'S MAGNUM BONUM has this year fully sustained its high character as one of the finest flavoured STRAWBERRIES known, and may now be had at 20*s*. per 100, or 3*s*. per doz.—Catalogues containing all the leading varieties of the day may be obtained from WILLIAM BARRATT, St. John's Nurseries, Wakefield.

NEW STRAWBERRY.

KITLEY'S CAROLINA SUPERBA, not surpassed in flavour, habit, and productiveness by any Strawberry extant, at the low price of 2*l*. per 100, 9*s*. per doz., free by post, to be had of Messrs. GARRAWAY, MAYES, & Co., Bristol, agents for the west of England and South Wales, or of any respectable nurseryman. For a full description, testimonials, &c., see this Paper, April 14, 1855.

JAMES KITLEY, Lyncombe Vale Nursery, Bath.

AZALEAS AND ERICAS.

W. J. EPPS has much pleasure in offering the following fine, bushy, well-grown plants, and of the choicest and best varieties, in large 48 and 32-size pots.

AZALEAS 18*s*. per dozen; 5*l*. per 100.
ERICAS 12*s*. and 18*s*. per dozen; 4*l*. and 5*l*. per 100.

These will make very pretty specimens for the ensuing season; all orders to be accompanied with a remittance from unknown correspondents.—Maidstone, Sept. 8.

HYACINTHS.

MESSRS. E. G. HENDERSON & SON

BEG to announce that they have now received their noted collection of HYACINTHS in excellent condition. They also beg to state, that having been for nearly 50 years the largest and most successful cultivators of this highly popular Flower in the vicinity of London, they can with confidence recommend the varieties named in their Catalogue as being the most suitable for pot or glass culture, and every way worthy the attention of Amateurs, &c.

Catalogues can be had on application, and for the assistance of those persons unacquainted with the culture of the Hyacinth, printed instructions will be given gratis with each order they are kindly favoured with.

CUCUMBER—HENDERSON'S "NAPOLEON III."

E. G. H. & SON have great pleasure in informing those who are fond of a really good Cucumber that they have succeeded in obtaining the stock of the above variety. It is one of the best for Winter culture and early forcing; is a free bearer and perfect in its form, possessing, indeed, all those qualifications of a good Cucumber which the most fastidious could desire. In packets, containing two seeds, 3*s.* each; ditto ditto, four seeds, 5*s.* 6*d.* each.

FLOWER SEEDS FOR AUTUMNAL SOWING.

It is not generally known that many of the hardy annuals, especially the Californian varieties, may be sown with great advantage in the month of September, and will resist ordinary winters with perfect safety, by which means the plants become much stronger and flower nearly a month earlier than those sown in the Spring, thereby giving a gay appearance to the garden at that particular period when most needed. Collections containing 12 distinct varieties, with printed instructions, 3*s.* 6*d.* each, postage free; ditto, 24, 6*s.*; 36, 8*s.* 6*d.*; 48, 10*s.* 6*d.*

CALCEOLARIA AND CINERARIA.

Saved from the choicest varieties, may be had in packets at 2*s.* 6*d.* and 5*s.* each; the finest quality of CALCEOLARIA is only offered at 5*s.*; second quality, 2*s.* 6*d.*

NEW PLANTS.

In the possession of E. G. Henderson & Son, and will be sent out for the first time in October.

SHOW GERANIUMS.

EXCELSIOR (HENDERSON'S).—Brilliant crimson, with dark maroon blotch, the lower petals are also beautifully spotted with maroon, fine form and stout petal, a splendid truss, good habit, and one of the most conspicuous of the new French spotted flowers. 42*s.*

LA BELLE ALLIANCE (FOQUET).—Top petals rich maroon spot shading off to scarlet and edged with rose, lower petals salmon with intense bright orange crimson spot, clear white centre, fine form, petals of great substance, good habit, and large truss, the most lovely coloured flower of all the new spotted class. 42*s.*

PURPLE KING (FOQUET).—A splendid purple flower, top petals intense dark maroon edged with crimson, lower petals rich mulberry painted, fine habit, free flowerer, and large truss. 31*s.* 6*d.*

MIDNIGHT (FOQUET).—Black top petals, with rich painted lower petals, fine habit and truss. 21*s.*

Or the above four varieties, 6l. 6s.

FANCY GERANIUMS.

AMPHITRITE (HENDERSON'S).—Rich bright maroon crimson, laced with white, fine free habit. Distinct. 10*s.* 6*d.*

DUKE OF CAMBRIDGE (HENDERSON'S).—Rich violet crimson, light centre, good form, fine habit, extra. 21*s.*

GIOVANNA (HENDERSON'S).—White, with maroon spot. Very fine flower. Distinct. 10*s.* 6*d.*

LA STELLA (HENDERSON'S).—Distinct and novel. Deep maroon, crimson self, laced with white, and clear white centre, fine shape, and very dwarf. 21*s.*

MOONLIGHT (HENDERSON'S).—Delicate lilac rose edged with white, lower petals spotted, large pure white throat, extra fine form, dwarf, and compact. Distinct. 21*s.*

REINE DU BAL (HENDERSON'S).—Dark crimson top petals, blush coloured centre, lower petals crimson blotched. 10*s.* 6*d.*

ROSY-LIP (HENDERSON'S).—Rosy crimson upper petals, with rose lower petals, fine form, good habit, free flowering. 10*s.* 6*d.*

QUEEN OF THE FETE (HENDERSON'S).—Purplish crimson upper petals, with blush white lower petals, large and showy, fine habit. 10*s.* 6*d.*

SWEET LUCY (HENDERSON'S).—A white flower, with pale lilac rose arch on the top petals. 10*s.* 6*d.*

TITANIA (HENDERSON'S).—White, with bright lilac rose spot in upper petals, free flower, similar to G. Delicata. 10*s.* 6*d.*

Or the above ten varieties for 6l. 6s.

CINERARIAS.

ADMIRAL LYONS (HENDERSON'S).—Large full-sized flower, white, with purplish violet edging, dark dice, fine form. 10*s.* 6*d.*

FUCHSIAS.

BANKS' FAVORITE.—Rich scarlet crimson, with violet purple corolla wide sepals, well reflexed, short tube, a free flowerer, and graceful habit. 10*s.* 6*d.*

PRINCE OF WALES.—A magnificent large crimson, with violet blue corolla, fine reflexed sepals, larger and finer than Glory. 10*s.* 6*d.*

RHODODENDRONS.

The following magnificent new species, collected from the Bhotan Mountains, by Thomas J. Booth, Esq., are now, for the first time, offered for sale.

BOOTHI, | HOOKERI, | CALOPHYLLUM, | KENDRICKI, | EXIMIUM, | WINDSORI LEUCANTHUM.

For full descriptions, with prices of the above splendid varieties, see Spring Catalogue, page 85.

GYNERIUM ARGENTEUM (THE PAMPAS GRASS).

E. G. H. and SON having in their possession the largest stock in the country of this noble ornamental Grass, will supply healthy plants in October at 2*s.* 6*d.* each or 25*s.* per dozen.

N.B.—Price to the Trade per 50 or 100 can be obtained on application.

GLOXINIA ERECTA.

Messrs. E. G. HENDERSON & SON have great pleasure in announcing that they were the first to introduce this new class of splendid and showy upright flowering variety of the Gloxinia into this country. They are most abundant flowerers, containing among them some of the most lively contrasts of colours imaginable, such as clear white, with rich velvety carmine, lavender and white, white with rich velvety violet. Price 5*s.* and 7*s.* 6*d.* each, or 60*s.* per dozen.

The Spring Catalogue or General List of Plants will be forwarded post free on application; and a beautiful Coloured Plate of NINE NEW FLOWERS *will be sent on receipt of* 12 *postage stamps.*

Wellington Nursery, St. John's Wood.

67, High Street, Battle, Sussex.

HOSE PIPING.

WAITHMAN'S PATENT FLAX HOSE PIPING will sustain a greater pressure, is lighter, less bulky, will wear longer, and is about 60 per cent. cheaper than the leather hose pipe.

Manufactured only by WAITHMAN & Co., Bentham, Lancaster.

No. 1 QUALITY, INCHES IN DIAMETER AND PRICE PER YARD:—½, 9*d.*; ¾, 11*d.*; 1, 1*s.* 1*d.*; 1¼, 1*s.* 3*d.*; 1½, 1*s.* 5*d.*; 1¾, 1*s.* 7*d.*; 2, 1*s.* 9*d.*; 2¼, 2*s.*; 2½, 2*s.* 3*d.*; 2¾, 2*s.* 6*d.*; 3, 2*s.* 9*d.*

SUPER EXTRA STOUT QUALITY:—2, 2*s.*; 2¼, 2*s.* 3*d.*; 2½, 2*s.* 6*d.*; 2¾, 2*s.* 9*d.*; 3, 3*s.*

No. 0, a cheaper Hose, to bear a low pressure for Garden and Agricultural purposes, at greatly reduced prices:—1, 9*d.*; 1¼, 10*d.* 1½, 11*d.*; 2, 1*s.*; 2¼, 1*s.* 3*d.*; 2½, 1*s.* 6*d.*

The Hose is Burnettised at an extra charge of 3*d.* per yard.

Union Joints, Branch Pipes, and Jets are also supplied.

WATERPROOF PATHS.
BARN AND CATTLE SHED FLOORS.

THOSE who would enjoy their Gardens during the winter months should construct their walks of PORTLAND CEMENT CONCRETE, which are formed thus:—Screen the gravel of which the path is at present made from the loam which is mixed with it, and to every part of clean gravel add one of sharp river sand. To five parts of such equal mixture add one of Portland Cement, and incorporate the whole well in the dry state before applying the water. It may then be laid on 2 inches thick. Any labourer can mix and spread it. No tool is required beyond the spade, and in 48 hours it becomes as hard as a rock. Vegetation cannot grow through or upon it, and it resists the action of the severest frost. It is necessary, as water does not soak through it, to give a fall from the middle of the path towards the sides.

The same preparation makes first-rate paving for BARNS, CATTLE-SHEDS, FARM-YARDS, and all other situations where a clean, hard bottom is a desideratum. May be laid in winter equally well as in summer.

Manufacturers of the Cement, J. B WHITE & BROTHERS, Millbank Street, Westminster.

TO NURSERYMEN AND GARDENERS.

REIGATE SILVER SAND, 12*s.* per ton, 1*s.* 6*d.* per bushel, or 16*s.* per ton, delivered to the London Wharfs or Railways, or within a circuit of five miles. Sacks 2*s.* each. Kentish and other Peats and Loam of excellent quality.

KENNARD BROTHERS, Swan Place, Old Kent Road.

SLATE WORKS, ISLEWORTH, MIDDLESEX.

EDWARD BECK MANUFACTURES in SLATE a variety of articles for Horticultural purposes, all of which may be seen in use at Worton Cottage, on application to the Gardener, Sundays excepted.

TO BRICKMAKERS.

CLAY GROUND AND STOCK BRICKS made at one and the same time, with ease, by One Horse, at the rate of from Eight to Ten Bricks the minute. Price of Machine at Hull, 35*l.* Reference given and particulars forwarded.—Apply to W. HODSON, Patentee, Kingston Square, Assembly Rooms, Hull.

EDWARD ELY, Hot-Water and Improved Hot-Air Works, opposite the Eagle Tavern, City Road, London, Manufacturer of the various description of Hot-Water Apparatus for Heating Horticultural Buildings, Churches, Mansions, Public Buildings, Offices, &c., &c., on the most scientific principles. Manufactories requiring Artificial Heat fitted up with effective and economical apparatus by contract or otherwise. Old work taken down, re-modelled, and re-fixed.

HOT-AIR AND STEAM WORK FOR DOMESTIC OR MANUFACTURING PURPOSES.

E. ELY, being a practical and scientific workman, is able to execute work at prices that defy competition. Parties by sending a rough sketch of the building and dimensions, can be supplied with the most improved Pipe Boilers, or any other description, with connections and pipes fitted and marked according to an accompanying plan; also Cement for joints, so that their own Tradesmen or Gardeners can fix them.

N.B. To those gentlemen who prefer one Boiler to heat the whole series of Hot-houses, &c., he recommends his large economical and powerful Boiler, capable of doing a larger quantity of piping than any boiler in use; and all works executed by him warranted perfect.

E. E. does not make a practice to praise his own works, but would be most happy to refer to numerous Gentlemen and Nurserymen, where Apparatus, &c., fitted up by him, can be seen in full operation.

Please to observe the Address, having no connexion with any other House in the Trade.

THE PAMPAS GRASS,
"GYNERIUM ARGENTEUM."

LUCOMBE, PINCE, AND Co. have now for sale a healthy stock of well established Plants of the above, which will bloom finely this autumn, varying from one to two and three flower stems. Few Plants are more ornamental than this gigantic Grass, the leaves (which are more than 7 feet in length curving gracefully outwards) grow in large tussocks, thereby producing a very fine effect, and from the midst of these numerous flower stems arise to the height of from to 6 to 8 feet surmounted by elegant panicles of inflorescence nearly 3 feet long, resembling beautiful waving plumes of silvery feathers. It is perfectly hardy, and is also easy of cultivation. A grand specimen of this noble plant is now in the Exeter Nursery, pushing up nearly twenty large flower stems and numerous small ones, and will continue to be an object of great attraction for a considerable time. Prices and full particulars may be had on application to

LUCOMBE, PINCE, & Co., EXETER NURSERY, EXETER.
Established 1720.

SPLENDID NEW BEGONIA,
SEMPERFLORENS SAUNDERSI.

GARAWAY, MAYES, AND CO. are now prepared to execute orders for this fine Seedling Begonia (raised by Mr. F. Saunders, Gardener to W. Miles, Esq., M.P., Leigh Court), which is, without exception, the most useful and beautiful variety in cultivation. The original plant first bloomed in May, 1854, when only 6 inches high, and has continued without ceasing to produce from the axils of every leaf its splendid panicles of transparent vermilion buds, which develope to fine clear brilliant rose flowers, emitting a most agreeable odour. Its habit is close and compact, seldom attaining more than 3 feet; foliage small and extremely bright, forming altogether an object of beauty unrivalled by any other variety in its class. Price 10*s.* 6*d.* each, with an allowance to the trade of one upon every three ordered; also a few extra sized plants at 15*s.* and 21*s.*

Durdham Down Nurseries, Bristol.

MESSRS. WILLIAM ROLLISSON AND SONS are desirous of directing the attention of the Nobility and Gentry, who are about to plant or make alterations in their Ornamental and Pleasure Grounds, to their immense Stock of AMERICAN PLANTS, in all sizes, which extends over an area of several acres. In large plants there are several thousands, and of such as Rhododendron catawbiense, Kalmia latifolia, Rhododendrum ponticum in varieties, and other choice hardy hybrids; many of them stand 5 to 6 feet high, and the same through, and literally covered with flower-buds.

Messrs W. R. and Sons are happy to say that their Dwarf and Standard trained, and other Fruit Trees, are this season remarkably fine; they have also a splendid lot of fruiting plants of Peaches, Nectarines, and Apricots in pots, which can be recommended as being exceedingly fine.

NEW PLANTS.

Messrs. WILLIAM ROLLISSON and SONS are now prepared to offer the annexed:—

COLEUS BLUMEI PECTINATUS.—This variety is a great acquisition; the foliage is variegated similar to Coleus Blumei, but the leaves are beautifully laciniated; 7*s.* 6*d.* each.

MANDIROLA ROEZLI.—A very fine flowering gesneraceous plant, producing fine spikes of lilac coloured blossoms, 15*s.* each.

ORTHOSIPHON SPICATUS.—A beautiful new greenhouse plant from Oeano, much to be desired for its foliage alone, which is deliciously fragrant; the flowers are large and white; 10*s.* 6*d.* each.

MANDIROLA LANATA.—A very curious free flowering gesneraceous plant of a delicate violet colour inside the mouth of the blossoms, and shaded lilac outside; 15*s.* each.

NEW CHRYSANTHEMUMS.

The Undermentioned can be supplied at 24s. per dozen.

Aureole, Aigle d'or, Arc-en-ciel, Adèle Prissette, Alexandre Pelé, Comtesse de la Chastnes, Créole, Duruffe, Danais, Eldorado, Fortunio, Figaro, Fimbriata rosea, Homène, Iris, Il Brasiero, Io, La Promise, La Carmélite, General Lafont, Mdlle. Clemence, Néréide, Precarieuse, Parpaillot, Rachel, Robert Bruce, Rose Bouquette, St. Agathe, St. Flore, St. Thais, Stellata Globosa, Trophée, Uranie, Vicomte de Caumont, Vicomte de Macarthy, Zenobie.

The Nurseries, Tooting, London.

ORANGES AND CAMELLIAS, suitable for producing an immediate effect in Conservatories and large Greenhouses, 7*s.* 6*d.* to 105*s.* each. Many of the Orange Trees are covered with fruit, and all the Camellias with bloom buds.

CAMELLIAS, in large variety, with flower buds, of choice imbricated kinds, 30*s.* to 42*s.* per dozen.

Otaheite and other small-growing ORANGES, at 30*s.* to 42*s.* per dozen.

Choice free flowering AUSTRALIAN and CAPE PLANTS, in strong healthy specimens, at 18*s.* to 42*s.* per dozen.

HEATHS, in fine autumn-flowering sorts, strong plants, in 25 varieties, 12*s.* per dozen; do. in 25 other sorts, strong, at 18*s.* per dozen; do. in 25 different and more rare sorts, at 24*s.* per dozen; do. fine hard-wooded kinds, strong plants, at 30*s.* to 42*s.* per dozen; half-grown specimens of the above, well adapted for provincial exhibitions, at 2*s.* 6*d.* to 7*s.* 6*d.* each.

AZALEAS, in great variety, fine bushy plants, that will flower freely next spring, at 12*s.* to 42*s.* per dozen; large plants of the above, 3*s.* 6*d.* to 21*s.* each.

New, erect, and other GLOXINIAS, in small plants, of the choicest sorts, at 18*s.* to 30*s.* per dozen.

ACHIMENES—Chirita, Gigantea, and other fine sorts, strong flowering plants, at 18*s.* to 42*s.* per dozen.

EPACRISES, strong plants, and of the finest sorts, at 12*s.* to 30*s.* per dozen.

GREENHOUSE VERONICAS, six vars., 9*s.* to 12*s.* per doz.

CONIFEROUS PLANTS, including many of the best and newest kinds out, in young plants, mostly raised from seed, at moderate prices, including Araucarias, Libocedrus, new Californian Pines, in seven or eight varieties, the Thuja gigantea, Cupressus excelsa, and many others.

STOVE, GREENHOUSE, and HARDY CLIMBERS, in considerable variety, consisting of free flowering and sweet scented kinds, strong plants, at 1*s.* 6*d.* to 3*s.* 6*d.*

APHELEXIS, in five leading sorts, fine young plants to train as specimens, at 1*s.* to 2*s.* 6*d.* each.

PERENNIAL HERBACEOUS PLANTS, in showy species, well adapted to make a display in the flower garden in autumn, at 42*s.* to 100*s.* per 100. Established in pots.

ALPINE PLANTS, suitable for rockwork, in variety, 50*s.* per 100.

A large assortment of Show, Fancy, new French Spotted, Variegated, and Scarlet GERANIUMS, at moderate prices.

New White Corolla and Double FUCHSIAS, Prince Albert, and other new dark varieties, at 3*s.* 6*d.* to 5*s.* each.

VERBENAS, including all the new and best kinds, both English and French, at 9*s.* to 18*s.* per dozen.

Large Flowering and Pompon CHRYSANTHEMUMS, strong flowering plants, 9*s.* to 12*s.* per dozen.

An assortment of Tropical and Hardy FERNS, of about 200 species, including some of the Arborescent kinds from Voldivia and Juan Fernandez, which are not to be seen in any other European collection, prices from 1*s.* 6*d.* to 10*s.* 6*d.* each, except in a few of the rare sorts, which will be from 105*s.* to 210*s.* each.

A large collection of ORCHIDEOUS PLANTS, of most of the leading sorts in cultivation, many of which have been imported during the last six months from Guatemala, Orizaba, Venezuela, the West Indies, Borneo, and Assam, in large numbers, and can therefore be offered at very *different prices* from what is *usually charged* for the same class of plants.

HUGH LOW AND CO., Clapton Nursery, London.—Sept. 8.

WARD'S OMAR PACHA STRAWBERRY.

WILLIAM JAMES WARD offers the above handsome fine flavoured Strawberry at the following reduced price:—100 plants, 1*l.*; 50 plants, 12*s.*; 25 plants, 7*s.*, strong and well rooted. In addition to the many flattering testimonials received last season, Dr. LINDLEY describes it as being exhibited at Chiswick, July 11, 1855:—"*Excellent in quality as well as attractive in appearance.*" See *Gardeners' Chronicle*, Leading article, July 14, 1855. The Editor of the "Florist and Fruitist," in the August Number report of the Exhibition at Chiswick, says—"WARD'S *Omar Pacha is a new Strawberry, and considering its high flavour and comparative hardiness is a valuable acquisition.*"

A few last year's plants 5*s.* per dozen.

Prospect Hill, Reading, Berks.

NEW STRAWBERRIES AT REDUCED PRICES.

GROWN AND OFFERED FOR SALE BY

WILLIAM J. NICHOLSON, Egglescliffe, near Yarm, Yorkshire.—The following splendid varieties have been well proved this season and given complete satisfaction, viz., Sir Harry (Underhill's), 100 plants, 4*l.*; 40, 1*l.* 18*s.*; and 20, 1*l.*; or 12*s.* 6*d.* per dozen. Pretty Poll (White's) gratis to purchasers of any of the above. All orders executed in strict rotation. The stock of one or two varieties being limited early orders are necessary. Catalogues, with full descriptions of the above, and all the best varieties out may be had in exchange for one stamp for postage.

Woodlands Nursery, Isleworth.

WILLIAM YOUNG begs to call the attention of Noblemen, Gentlemen, Public Companies, and Planters in general to his extensive stock of CHOICE CONIFERÆ, HARDY EVERGREENS, ORNAMENTAL TREES, AMERICAN PLANTS, &c., which are this season particularly fine, and having been well prepared for removal, he can confidently recommend them to transplant with perfect safety.

W. Y. invites persons about to plant to inspect his stock, which is standing over 50 acres of ground, in which will be found all kinds of plants adapted to every description of ornamental planting. It consists of HARDY CONIFERÆ, containing some of the finest specimen plants ever offered.

AMERICAN PLANTS.

Azaleas, fine named sorts
Rhododendron ponticum (good for cover).
Do. all the new and best vars.
Kalmias, Andromeda, Ledums, &c. &c.

STANDARD ROSES, of all the best varieties.
FRUIT TREES, ORNAMENTAL DECIDUOUS TREES, for Parks or Avenues, from 10 to 12 feet.
FOREST TREES, for Copse Planting, from 2 to 4 feet.
Prices given on application.

A Catalogue is now ready, and may be had for two postage stamps.

The Nurseries are two miles from Godalming Station, South-Western Railway, where conveyances can always be obtained.

Milford Nurseries, near Godalming, Surrey.

PANSIES, PHLOX, DELPHINIUMS, AND PINKS.

BY NAME, AS WELL AS A LARGE STOCK OF EARLY BORDER VARIETIES, AND TRUE DARK CRIMSON CARNATION CLOVE.

JAMES MAY begs to inform the Trade and Growers in general, that he has now ready a large stock of strong plants of the above; price per 100 or per 1000 on application.

J. M. at the same time begs to inform his friends that he has a limited stock of the new white Cloves "Purity" and the "Ghost," price per pair on application.

Pansy Seed 2*s.* 6*d.* to 5*s.* per packet, all carefully gathered from 100 of the best show varieties.

Shortland Nursery, Hammersmith.

RHODODENDRONS.

JOHN WATERER begs to announce that he is now prepared to execute orders for his two New Hardy Hybrid Rhododendrons, in good established plants, at 42*s.* each.

Rhododendron JOHN WATERER, colour glowing carmine, large truss, fine foliage, and a most abundant bloomer, in perfection about the 15th June.

Ditto, MRS. JOHN WATERER, a bright rosy crimson, fine conical truss, a very free blooming kind, in flower about 15th of June.

To the admirers of this justly noble class of Plants, JOHN WATERER has the pleasure of recommending the above as being the greatest acquisitionsye t offered. They combine in a marked degree the necessary requisites for really first-rate hardy crimson varieties, viz., imposing colours, abundant bloomers, extreme hardiness, and flower at a time when they are not liable to be injured by spring frosts.

The American Nursery, Bagshot, Surrey, Sept. 8.

PYRAMIDAL PEARS ON QUINCE STOCKS, AND ORCHARD HOUSE TREES IN FULL BEARING.

MR. THOS. RIVERS begs to announce that the large Collection of the above at Sawbridgeworth is now in perfection. The Harlow Station of the Eastern Counties Railway, about one mile from the Nursery, is the most convenient.

The Nurseries, Sawbridgeworth, Sept. 8.

NEW PLANT LIST.

JOHN AND CHARLES LEE'S CATALOGUE OF STOVE AND GREENHOUSE PLANTS for the present Autumn is just published, and may be had, post free, on application.—Nursery and Seed Establishment, Hammersmith, near London.

The Gardeners' Chronicle.

SATURDAY, SEPTEMBER 8, 1855.

IN his new work on VENTILATION,* Dr. ARNOTT relates the following cases, by way of illustrating the importance to human beings of constant access to fresh air.

1. "In a family living in a good house, near Russell Square, one of the children aged four years was observed to have a gland of the neck beginning to swell, and the mother was much pained by hearing that some person had called the affection scrofulous. She was not yet aware that the foul air of a crowded dwelling is all-sufficient to produce scrofula, as well as many other diseases. The medical friend consulted on the occasion had at former times remarked favourably on the healthfulness of the children and the management of the mother. Now, however, within a short time, twin children had been added to the family, with another servant, and low grates had been substituted in the sleeping rooms for the old-fashioned grates with high mantel-pieces which favoured ventilation by allowing escape for hot air from above the level of the children's beds. All the children, therefore, during the night were now breathing the impure air which accumulates in the upper part of unventilated bed-rooms. On examining the whole family, it was found that the general health, not only of the little patient with the swollen gland, but of the others also, had of late become notably impaired. There could be no doubt that the new state of the atmosphere in the house was the cause of the evils. Ventilating valves were introduced. Not more than a month afterwards the medical adviser was again called, but then only to witness the happy effect of the simple remedy prescribed—for to the new ventilation the mother was attributing all the good obtained. A single fact, however, remained unexplained. The nurse who had entered the family long before had for more than a year become so weak, and liable to what she called a constant weight on her head, that she was incapable of much active exertion, and was retained in her post chiefly for her trustworthiness and experience. She also now had regained health and activity, but as she had been ill for more than a year, while the children remained well, and she was supposed to have been breathing the same atmosphere as the children, it was concluded that the cause of her illness could not be the same as that of theirs. The truth was, however, that the nurse had not always breathed the same atmosphere, for being taller than the children, and constantly in the nurseries, with her head in the comparatively stagnant air above the level of the chimneys, while the children until the lowering of the grates were always in a comparatively pure air below that level, she had breathed the impure air much longer than they. The high ventilating valve cleared away the pernicious air from both nurse and children."

2. "There are many facts to show that the im-

* *On the Smoke-less Fire-place, Chimney Valves, and other means old and new, of obtaining Healthful Warmth and Ventilation.* By Neil Arnott, M.D. F.R.S. &c. 8vo, pp. 232. Longmans (6*s.*)

purity of retained and corrupted breath, scarcely heeded in general, has been the chief element of the foul atmosphere which has led to numerous cholera outbreaks. Thus, in England, it has been in public institutions, clean to the eye, not very offensive to the nose, and where the inmates were well fed and well clothed, and otherwise well-cared for under frequent public inspection, but where ventilation was overlooked and defective, that some of the most shocking scenes of destruction from cholera have occurred. Such was the school at Tooting, of above a thousand parish children, among whom about 300 cases of cholera suddenly occurred, and killed more than half of those affected before the crowd was dispersed. And various union workhouses, lunatic asylums, prisons, &c., in London and elsewhere, were similarly visited. Such places in the end of 1849 produced more than half the cases of cholera which then occurred about London, as is set forth at page 37 of the valuable 'Report on Cholera,' prepared by Dr. Baly and Dr. Gull, and issued by the College of Physicians. The very crowded school of the union-house at Taunton, in Somersetshire, became a remarkable example: 30 cases suddenly appeared in the room of the girls, in which the glass of the windows remained entire, while in the adjoining room of the boys, *where panes of glass were broken, and so admitted fresh air, not a single case occurred*, and there was only one other case in the whole town."

In another place the same experienced physician makes a further remark:—"One of the most hurtful to man of all the aerial poisons is that of his own expelled breath, when detained long around him and breathed again. A considerable proportion of the solid aliment and drink which he receives is thrown off by the lungs and skin, as kinds of excrementitious matter, in the forms of carbonic acid, water, and aëriform organic matter. The last-named portion gives a certain odour to the breath and bodies of many persons even in good health, by which a dog often can trace his master, and with impaired health it becomes copious, offensive, and pernicious. This organic matter, probably at first, when it may be called fresh, is harmless, for a mother does not fear to kiss her beautiful child, nor do persons in a crowded church, or other place where healthy people assemble, much fear their neighbours, but there is no doubt that it soon becomes putrid and noxious. In early states of society, before glass windows were used, and when men lived almost in the free air, they had no notion of this poison, and that ignorance continuing through later times explains to us many of the facts connected with the generation and spread of plagues or epidemics."

These are very striking statements, the truth of which no intelligent person will venture to question. But it occurs to few that Dr. Arnott's cases have everywhere their counterpart in the vegetable kingdom. The instance of the girls shut up close in the school at Taunton, and of the boys in an adjoining room, with broken windows, is precisely parallel with the plants cooped in the greenhouse, and others living in the open air. We will not pause to inquire what the exact reason is. It may be that plants are starved in the first case by want of atmospheric food, and abundantly fed in the other; or it may also be that "one of the most hurtful to a plant of all the aërial poisons is that of its own expelled breath when detained long around it and breathed again;" for if the carbonic acid removed from their system is injurious to animals, so may the oxygen or other gases expelled from their system by plants be equally prejudicial to them, for aught we know to the contrary. But it is needless to inquire how the case may really stand; if physiology cannot explain the precise reason why stifled plants do not thrive, it is enough for practice to know that the fact is so; and having gained the knowledge, to apply it.

Let a number of growing plants be shut up for many days in a chest perfectly close; all know that at the end of those days most will have died, and that such as continue to live are bleached, feeble, and perishing. This result is said to be caused by want of light; and is, no doubt, aggravated by it. But if the chest has holes cut in its sides, the evil consequences are for a long time averted; and yet the amount of light admitted by the holes is very small. Is it not rather the freer access of air which sustains life in this case? If there is no proof of the affirmative, there is an equal absence of all disproof. A glass house, shut close, is nothing but a chest, the sides of which are partially transparent. Cooped up in such a box for many days, some plants will die, and those which live will be pallid and sickly. Cut holes in the sides of the box in the form of doors and opening windows, and then also evil consequences are long averted; but they come at last. Take off the roof and sides, and robust health permanently supervenes. Yet the quantity of additional light admitted by removing the roof is but inconsiderable; plants have little more than before. What they do enjoy in abundance is free air, or it would be better to say, unimpeded respiration, with a complete absence of their own atmosphere whether it be vitiated by exhaustion or deterioration.

There can be no doubt that the instances given by Dr. Arnott of evil consequences manifestly derived from a polluted atmosphere are precisely analogous to what attend plants under similar circumstances. The yellow spindling Geraniums in Mr. Absolon Chilly's greenhouse are the scrofulous children of Russell Square. The dead and dying in Sir Simeon Suffocate's grand conservatory are the poor parish children at Tooting.

In the last number of his very interesting "Journal of Botany" Sir William Hooker laments over the want of skill yet so manifest in gardens notwithstanding our boasted horticultural eminence. Speaking of the Rice-paper plant, which has been flowering magnificently at Hong Kong in the garden of Sir John Bowring, but which still remains a poor sterile thing at Kew, he writes as follows:—

"Captain Mellersh, late in command of H.M. steamer Ranter, which conveyed Sir John Bowring and his suite to Siam, has just arrived from Hong Kong, bringing from J. C. Bowring, Esq., noble flowering racemes of the Aralia papyrifera, which have flowered in high perfection in the Governor's garden at Hong Kong, and the plants have attained to a great size: while in our European stoves our plants, imported by Sir John Bowring from Formosa at the same time with his, and of the same age, have continued small and shown no disposition to flower: forcing upon us the humiliating conviction that, however high our nation may stand as successful gardeners, we have yet much to learn in regard to the skilful cultivation of tropical plants, which, speaking generally, and of the larger and especially the shrubby kinds, so seldom yield flowers, and infinitely more rarely fruits. Mr. J. C. Bowring, whose letter accompanies these flowering specimens, observes:—'The two specimens now sent, one in bud, with copious bracteas, the other with the flowers fully expanded, are from the large plant at head-quarters here, which was a shoot from my original plant, but has much outgrown its parent. I was obliged to cut the latter down, to save its life; but it is now again a fine healthy plant, and I hope will flower next winter. The species has a very handsome appearance when flowering. The one above mentioned threw out 12 fine panicles of blossoms (besides two which I cut off before the flowers burst forth), more than 3 feet in length, and they crowned the shrub in beautiful style, drooping like magnificent plumes, in regular form over the large, dark, palmate leaves below.'"

Now, there is nothing whatever in Hong Kong which England is unable to supply, except that combination of heat and free air which nature provides in China.

Such being the case it cannot be admitted that the imperfection of modern gardens is owing to an absence of horticultural skill. The blame lies quite as much, or indeed much more, at the door of the garden architect. His business is to provide means for combining heat and the freest ventilation wherever a plant has to grow. That the garden architect cannot do. Let us hope then that a man like Dr. Arnott, eminent among the most eminent in his application of philosophy to matters of daily necessity, will turn his attention to garden structures and show how that is to be done, without which all exotic gardening is but a pretence, unless effected at enormous cost. In his most interesting volume, which concerns the exigencies of man's dwelling-places, he deals successfully with everything except the atmosphere of plants. We earnestly hope that, his first object having been gained, he will be able to direct his eyes upon lower matters, and to show us how to sanitarise the air of a plant house as well as of a dwelling house.

So much has been heard of "sports," and "varieties," and "mules, hybrids, or cross breds," and of all manner of forms produced no one knows how, from Adam's Laburnum up to Boghos Bey's trifacial Orange, that one would have thought the list exhausted. Nevertheless a Scotch correspondent tells us of a case as strange as the strangest yet recorded, and more puzzling than most.

We learn that he has a Gooseberry bush which bears indifferently on each small twig red or yellow berries, the red superior in flavour to the yellow, and both dissimilar; the reds, too, are unlike, for some are rough and others smooth; and the yellows bear seed that is red. Had a handful of yellow berries been thrown in among the reds and accidentally stuck to the branches the mixture could not be more complete. Three twigs close together may be described as follows:—

1.	2.	3.
Red	Yellow	Red
Yellow	Yellow	Red
Yellow	Red	Red
Yellow	Yellow	Red
	Yellow	Yellow

We hope to receive specimens shortly at our office. In the meanwhile those who live near Glasgow may satisfy themselves as to the reality of the sport by calling on Mr. Thomas Telfer, of Woodhouse Hurlet.

New Plants.

142. Eremurus spectabilis. *Bieberst. fl. Taur. cauc. III.*, 269. *Bot. Mag.*, *t.* 4870.

A very fine showy herbaceous hardy plant, with the habit and appearance of an Asphodel. The flowering scape is 2 or 3 feet high, and terminated by a fine compact pyramidal raceme of yellow flowers, the effect of which is greatly heightened by long rich orange-brown stamens. It is said to be found wild in Siberia, the Caucasus, Koordistan, the Crimea, and even in Scinde, where the late Dr. Stocks appears to have met with it. No doubt it is a plant of the most easy cultivation. At Kew it flowers in June.

We may add to the description in the Botanical Magazine that this is the famous *Cherish* or *Tchirish* plant of Eastern people, as we know from specimens in our herbarium collected by Dr. Dickson for Mr. Brant, her Majesty's Consul at Erzeroum, and by our excellent correspondent, Mr. H. Calvert, of the same place. The latter gentleman, in recently communicating specimens of the article to Sir William Hooker for the Kew Museum, makes the following statement:—"Jaubert, in the 'Voyages d'Aucher Eloy,' p. 200, mentions the Tchirish plant to be Asphod. ramosus, but you will see by the specimen marked No. 1365, sent to Dr. Lindley, that Jaubert is in error. The roots of this plant are dug up in May, and after separating the young tubers of the year from the older ones (the former being finer in quality than the latter), the roots are bruised, dried, and then ground to powder, and in this state are exported from Koordistan to various parts of Turkey. Its adhesive qualities render it useful to saddlers, shoemakers, bookbinders, &c., and for 'filling' for the coarse native cotton cloth, &c., wheaten flour paste never being employed in this country as a gluten. To make Tchirish paste the powder has merely to be added gradually to cold water and then stirred. Pouring water on the powder is not so effectual, as the Tchirish clogs into lumps. In May and June the young shoots are sold in town as a vegetable. When cooked, green Tchirish has a taste intermediate between Spinach and Purslane, with the glutinous property of Okra; in fact, it is by no means a disagreeable vegetable. I had hoped to have sent you seeds, but in the disturbed state of the country I could not induce any one to go for them."

It is rather curious to find our own "Bath Asparagus," namely the young shoots of Ornithogalum pyrenaicum, thus imitated among the delicacies of Koordistan.

VEGETABLE PATHOLOGY.—No. LXXXVII.

360. Cladoptosis*—(*Fall of Branches*).—It was stated above that the fall of the leaf was in many cases, and perhaps in all, a vital process, put in force by the growing plant to get rid of dead incumbrances. This view is confirmed by what takes place in the fall of branches. Fruit, moreover, follows the same laws as leaves, and when it has acquired its full growth and development separates in like manner from the parent stem. In some cases, new buds have been developed from the scar, the margin of which often swells extremely, and acquires quite a new aspect; but more frequently where the fruit has been but one of many branches on a panicle, the separation does not ultimately cease at the first scar. In the Pear, for instance, a series of sub-horizontal fissures gradually takes place as the superior parts decay, till the origin of the whole panicle is reached, and if separation does not take place, which is sometimes the case when the vital action below is not sufficiently active, the living parts are infected by the dead matter above, and canker is the consequence. Now, though there is an evident articulation at the base of each peduncle, there is none at the junction of the individual internodes, nor is there in many cases any transverse tissue of different structure from the rest which might induce rupture.

361. This disintegration of the stem of the panicle after the fall of the fruit may be considered as a sort of Cladoptosis, but there are other more palpable instances to which the name may more strictly be applied. The common white Willow is extremely subject to such an affection, and one precisely similar in the Oak was many years since forwarded by an unknown correspondent to Dr. Lindley. The cause of death in the branches is uncertain, sometimes perhaps it may be cold, sometimes the superior demands of other parts of the tree which divert that nourishment which was destined for their use. Unless some process of this kind took place, every bud upon a tree would be equally developed, and there would be no room left for the circulation of air or the admission of light. Now, if the branchlets were simply broken off by the wind, a ragged surface would be left, easily affected by the weather, and calculated to cause decay. A vital action, however,

* From κλάδος, a young branch, and πτῶσις, the act of falling.

takes place, by which the tissue of the living bark is separated from that of the dead branch, so regularly as to present on a section a concave facet; the living and dead tissues are separated by a few friable cells, and the first high wind snaps the wood, so that the branch falls out, leaving a smooth even cup. This process sometimes takes place again and again, imitating on a large scale what takes place in the common stem of the panicle in the Pear tree. Except some vital force were exercised, it is difficult to conceive how the fracture should always be so regular.

362. The disarticulation of Vine shoots, called by Ré Phriganoptosis (a word of doubtful origin), which takes place principally when the previous summer has been cold and cloudy, and the wood in consequence imperfectly ripened, is different from either of the cases mentioned above, inasmuch as there is a distinct tissue corresponding with each eye, in the line of which the fracture takes place. It may be observed most years in small lateral shoots; the larger ones fail only under a pressure of severe weather. This disease was well known to the ancients, and was called by Pliny after Theophrastus *articulatio*. As in all cases where morbific matter is likely to be communicated to the main stem, close pruning is imperative. It is the practice of some to bury the shoots of their Vines in winter; but this is in no case a good practice, and where the wood is ill-ripened can only be followed by disappointment. The only remedy which is available is the exposure of the young shoots as much as possible to light and air by thinning out everything which is superfluous, and in any case this is advisable, for good crops or well-flavoured produce can only be expected from perfectly ripened wood.

363. Larger branches are not in general thrown off, but remain when dead from accident or disease upon the tree till natural decay takes place, which, as in the Elm, is often promoted by such fungi as Agaricus ulmarius. Nature, meanwhile, has not been idle; but a cushion of healthy bark is formed all round the base ready to close up the aperture by its rapid growth so soon as the decayed matter shall have fallen out. *M. J. B.*

NOTES ON TRANSPLANTING.—No. II.

I have urged early attention to the preparation of the soil for planting, and I repeat it, because I am convinced of its importance. I could give many examples, not only of great inconvenience arising from a retardation in the progress of works, but of the waste of much time and money, resulting solely from an indifference to, or a total disregard of, such council. Half the failures in planting arise directly or indirectly from procrastination in this respect, and I shall have effected good service if fortunate enough to convince any apathetic reader of the fact.

In very stiff soils where the spaces for the shrubberies, as well as those for the smaller clumps, only are trenched, something beyond the general drains (which will be of course laid down before any other work is commenced) will be required, if, as will often be the case, no general drain passes through them. Such spaces, from the compactness of the unbroken soil around, become reservoirs for water unless some means of escape is provided for it. This should always be given. An auxiliary drain entering a contiguous one is easily added, and will be found an effectual remedy. I have seen the worst effects result from non-attention to this. The bed so circumstanced becomes converted into a quagmire, the roots of the shrubs perish, and, as a natural consequence, the plants sicken and die.

In planting single specimens on the lawn, too, similar results will have to be guarded against, where the whole area of the grounds has not been trenched. Whether a large or small site is prepared there are few situations where a drain from the bottom will not be necessary. I remember an instance—one among many similar ones—where a number of Conifers were planted singly on a lawn, the soil of which was very tenacious. Holes were properly prepared by deep trenching, and the addition of new soil, and the trees planted at the end of September. For a time all seemed well enough; but by the following spring many were dead, and others, especially the Junipers, of which there were several, had lost many branches from sheer rottenness. On examining the soil it was found to be little better than mud, especially at and near the bottom of the holes. The autumn and winter had been very wet, and as there was no outlet for the water, which of course collected in the loose soil, the trees had stood for three or four months with their roots in it, with what effect may easily be inferred. And to make the matter worse, the plants had not been placed high enough at the collar in the first instance, and the soil having settled down below the natural level, that important part of every plant was nearly always surrounded by a pool of water. Great care should be taken to prevent this, and as it is difficult to calculate to a nicety when a tree is planted in newly-moved soil, it should, when possible, be allowed to subside before the tree is placed in it. Every specimen on a lawn should stand a few inches at least above the natural level. It is important to secure this, both on account of the well-being of the plant and its appearance also. A tree standing on a gentle elevation, which seems to spring naturally from the surrounding lawn, has an infinitely superior appearance to one placed in a hollow, other circumstances being equal.

Of course the success of a transplanted shrub or tree will depend in no small degree upon the condition in which it is removed. A shrub may be planted with perfect success at a period by no means favourable to the operation if it is carefully taken up; while a similar one will fail at the best of all seasons from damage to its roots by unskilful or careless hands. A plant, it should be borne in mind, derives the chief amount of the fluids which support it by the agency of its succulent root-tips, and in proportion as these are destroyed so are the resources of the plant cut off till new ones are formed. If I were not convinced by the practice I have often seen that this advice is needed, I would not venture on so common-place an observation.

Presuming the preparation of the soil for planting to be in every respect perfect, and the season fitting, subsequent labours will be greatly influenced by circumstances attending the plants to be removed—whether they have merely to be taken from one part of the grounds to another, or at most but a short distance; or received from a nursery many miles away, and after a journey, possibly, of two or three days' duration—it will be readily understood that the conditions of the respective plants must differ materially, and will consequently demand a different mode of treatment.

I must here beg permission to say, that nurserymen are frequently charged with sending inferior plants from their being found dead a month or two after planting, when, in reality, the person who superintended the work is the guilty party. Having made this charge I must in fairness give the evidence upon which it is founded—evidence, be it understood, by no means circumstantial, but essentially practical, and which I have seen many times confirmed.

Well, then, a nurseryman receives an order for a given number of trees and shrubs, with instructions to send them by rail to a certain station, from which they will be taken by the waggons of his customer. They are of course despatched, and in due time reach the ground where they are to be planted, though, thanks to the tardiness of railway transit, they are often a long time on the road. Now, it frequently happens that the weather is very warm and sunny during the whole time the plants are out of the ground, and when they reach their destination the roots are completely dried up, and the plants otherwise drained of their moisture by evaporation. In this condition have I seen plants, and that not seldom, thrown in heaps upon the ground where they were to be planted, with perhaps an old mat or two cast over them as an apology for a covering from the wind and sun, but often with no covering at all, and then put into the ground without any other care or preparation. Small deciduous plants may, and in a measure do, bear up against such treatment; but that evergreens should survive it is a standing miracle to any one at all conversant with the constitution and requirements of vegetable life. Of course very many failures do result; nothing less could, under the circumstances, be reasonably hoped for.

I have no wish to hold up nurserymen as immaculate, or to deny that some of them do not at times send out coarse-rooted plants, and that numerous deaths are the consequence; but I also know that losses arising from the causes above noticed are often unjustly laid to their charge. I am sure I shall be pardoned for making this little digression.

Now supposing a large number of plants to arrive in the condition above described, this is how I would treat them:—Procure a tub or two each a yard or so in diameter, and 2 feet deep. Fill them to within 6 inches of the rim with water and loam mixed to the consistency of cream. Let the roots of every plant be dipped in this, and immediately "laid in," taking care that they are well covered with soil. For convenience the plants should be placed in rows, and as each row is finished give a good watering, and not only at the root, but by means of a rose to the watering-pot well sprinkle their stems and branches. All the plants will imbibe a large amount of moisture through the soft parts of their stems and branches, and the evergreens in addition by their leaves. If in the day, and the sun is at all powerful, some mats or even straw thrown over them will be very beneficial. At night this may be taken off for the sake of the dew; but nevertheless another good sprinkling from the watering-pot may be given them with advantage. By the following morning the plants will be found to have imbibed moisture equivalent to what they lost on their journey. The roots, too, will be moist and in a condition to resume their functions immediately. The value of such treatment to exhausted plants can hardly be over-rated, and will often be found the turning point between failure and success.

Plants which are merely transplanted from one part of a garden to another are always benefited by the application of a few gallons of water at their removal. The best time to apply it is when sufficient soil has been thrown in to fairly cover the roots. If applied then, the mould is washed well in among the fibres, and by filling in the remaining soil upon the wetted portion, evaporation is checked, and the moisture secured to be gradually appropriated by the plant. Mere surface watering is of little avail, unless very carefully and liberally supplied.

Newly planted trees are, however, often much benefitted by mulching, and if employed as an auxiliary to watering, a double advantage is afforded by it. *G. W. L.*

DR. JOHNSTON, OF BERWICK-UPON-TWEED.

This excellent naturalist, I regret to announce, died from the effects of a paralytic attack on the 30th July last. He was born, I believe, at Ilderton, in Northumberland, and educated at the Berwick Grammar School until his removal to Edinburgh University. In that city he resided several years as an inmate of the house of Dr. M'Crie, the ecclesiastical historian, and as the pupil and ultimately the assistant of the celebrated Dr. Abercrombie. About 1820, having graduated in medicine, he returned to Berwick and commenced practice there, carrying with him the love for natural history which he had imbibed at college, and from that time to the end of his active and useful life all the leisure he could command was devoted to his favourite studies. His residence on the sea-coast directed his attention to ichthyology, as well as to the marine worms and insects, zoophytes and sponges; and a series of his original observations and discoveries appeared from time to time in "Loudon's Magazine" and in the "Annals of Natural History," the value and correctness of which have been acknowledged by all subsequent labourers in the same departments.

His first separate work was a "Flora of Berwick-upon-Tweed" (2 vols. 1829 and 1831), which is not a mere classed catalogue of species, but a truly readable book enlivened, and not overloaded, by valuable information and appropriate poetical quotations. These volumes are illustrated with drawings of new and rare plants drawn and engraved by Mrs. Johnston, who was indeed a helpmeet to her husband in all his publications.

His medical skill and pleasant friendly manners had in the meantime gained for him a large and increasing medical practice; and the active interest he took in the welfare and progress of society led to his being appointed a magistrate, and on different occasions mayor and sheriff of Berwick.

It was during his mayoralty in 1838 that he brought out the first edition of his "History of British Zoophytes." In the preface he observes (in reference to his studies in the midst of occupation) that "idleness has no leisure." He was again mayor in 1841, when the Highland Society held their show at Berwick, when his hospitality and urbanity and varied powers of mind had full room for their display, and were gratefully acknowledged both by his townsmen and by strangers.

In 1842 appeared his "History of British Sponges and Lithophytes;" and in 1847 an enlarged edition of his "Zoophytes" in two vols. This is not only the standard text book on the subject, but is distinguished by its literary excellence no less than its scientific merits.

In 1850 he published an "Introduction to Conchology," describing not only the shells but their molluscous inhabitants. It was reviewed by the late Professor Edward Forbes in the "Westminster Review," and hailed by him as a most delightful addition to the literature of natural history. Its merits are also recognised on the continent, and it has been translated into German by Prof. Brown, of Heidelberg.

Of his last work, "The Natural History of the Eastern Borders," only the botanical portion has appeared. This was evidently to its author a labour of love, his last-born child, and it affords ample proof of the eager delight which he took in the beauties of nature, and of his genial sympathy with all those pursuits and aspirations which constitute the true happiness of man. We may particularise (what may appear to some a superfluous addition, but forms a very charming episode) a lecture read before the Berwick Mechanics' Institute on "Our Wild Flowers and our Pastoral Life," full of kindly feelings and beautiful images. In this work he refers to the assistance received from the members of the Berwickshire Naturalists' Club, a local association which embraced several distinguished names, but of which he had been the originator, its secretary and treasurer, in fact its life and soul, for more than 20 years. The transactions of the club, printed yearly for private circulation, contain many valuable papers from his pen, such as descriptions of rare plants and animals found in the locality, and complete monographs of the Sepiæ, the Mollusca and the Acarides of Berwickshire. The monthly excursions of the club during the summer months to places within 25 miles of Berwick, leave a grateful impression of pleasure enjoyed and information acquired in the memories of all who had the opportunity of attending them. *T. R.*

Home Correspondence.

Sulphured Hops.—Having read with considerable interest your opinion on this subject, I trust you will allow me to make a few remarks. I am a grower of Hops, as well as a consumer, and I state, without fear of contradiction, that I have used many tons of Hops which have been sulphured without any loss or injury, and this over a space of six years. It is a well known fact that Goldings are more susceptible of mould than any other sort, and that they also are the best when grown free from disease. I therefore consider it of importance to the brewer that this sort should be grown more extensively, which can be done if sulphur judiciously applied to them, when in a growing state, can be proved to be of no injury to the beer. To make this apparent, I offer to any of the leading houses in London, Messrs. Barclay in particular, as they have suffered from the use of sulphured Hops, that I will supply them with a sufficient quantity for a brewing, and if at the end of three or six months they consider the beer injured by the quality of the Hops, I will not only forfeit the Hops but any loss they think has arisen from the use of them. I will also pay a man, whom they shall depute, to see that they have been sulphured, picked, packed, and sent

to London. It must appear that this offer is presumptuous; but having more than 100 acres of Hops, and those principally Goldings, my apology must be that I am anxious to prove the truth of my assertion. *Charles Lency, Wateringbury, Kent, Sept. 8.*——Allow me to offer a few remarks on the controverted question whether or not the application of sulphur to Hops in their growing state occasions a bad flavour in beer brewed from them. It is admitted by those opposed to the use of sulphur, that there are only two ways in which this evil can be produced: one is that the sulphur combines with the oxygen given out by the plants, producing a deleterious gas; the other is, as stated in the Hop merchants' circular, that the sulphur is "actually incorporated into the plant during its growth." Now, with regard to the first supposition, if it were possible that sulphur could unite with oxygen without the aid of heat, the same gas would be produced as that to which Hops are exposed in the oast-house, though in much less quantity, yet the larger doses have never been accused of injuring the quality. As to the statement put forth by the Hop merchants and factors that the sulphur is actually incorporated into the plant during its growth, it is well known that no food, physic, or poisons, can be absorbed by the leaves, nor even by the roots of plants but such as are in a state of solution. I would therefore request the Hop dealers to try whether they can dissolve sulphur in water; furthermore, to bring it more under the treatment it would receive if mixed with Hops in brewing, I would ask them to boil it in water, and when perfectly cool try whether nose or palate can discover that bad flavour which sulphur is *said* to impart to beer. But they say—"It has been practically ascertained that Hops treated with sulphur impart so obnoxious a smell and flavour to beer as to render it unsaleable." If this *has* been "ascertained beyond all question," let them bring forth their proofs, and if they are sound, there is an end of all controversy; till then I remain *Dubius, Tunbridge Wells.*

Yeast.—Allow me to inform your correspondent Lucy Grey (see p. 584) that a small teacup-full of yeast is sufficient for 4 lbs. of flour, and that the best way is to mix the flour the evening before baking with a quart of warm water in the usual manner—then stir in the teacup-full of yeast. In reply to notice, p. 590 (Barm), when the stock of barm is nearly exhausted use a teacup-full in the manufacture of another quantity. *C. Clifton, Sept. 6.*

Everlasting Pea.—Has the Everlasting Pea (as it is commonly called) ever been tried as a food plant? In gardens it comes up year after year with undiminished vigour, throwing up its flowering stems from 7 to 9 feet high. Why should it not be grown in the same way as Lucerne? Its deep roots make it independent of drought. The flavour is very agreeable (like that of green Peas), and there can be no fear of its perfect wholesomeness. I believe it would bear several cuttings, and yield an immense weight of highly nutritious produce. Have any of your enterprising readers cultivated it? If not, I commend it to them as well worthy of a trial. *Wm. Marshall, Ely.*

Some Observations on the Progress of Vegetation during the Past Spring and Summer.—To both the physiologist and the gardener the past spring and summer have afforded much valuable information. The unusually cold and backward spring seemed to threaten destruction, or at least considerable damage, to advancing vegetation. General opinion placed the season nearly a month later than usual, so far as it affected the growth of plants; yet who can recollect a summer when the crops throughout the country looked more luxuriant than in the past one, or an autumn which gave a more abundant harvest than the present? To the cause, therefore, of this rapid change in the appearance of the crops I now intend to direct attention; and I shall set out with the dogma that a late spring must always be highly beneficial to the progress of vegetation in this country. I have long entertained this opinion, and the observations of successive years only confirm me in it. I do not mean to infer that a late spring has not its peculiar evils, and that some plants are not occasionally injured by it; what I contend for is that the staple crops of the country are always more abundant, and are never prejudicially late in arriving at maturity, from being retarded in the early periods of their growth; in fact that they are benefited rather than injured by what we are pleased to call a late spring. This I conceive is easily accounted for upon the recognised principles of horticulture. Everybody knows that a plant, to push luxuriantly in its branches and to ripen an abundant crop of fruit, must of necessity be strong and active at root; and, moreover, that such root action should not only keep pace with, but precede the development of its shoots. Now this is precisely what a late spring does. It must be recollected that we invariably have very early in the year, and before the proper spring season begins, a series of sunny days. The earth during this period absorbs heat to a large amount; this favours root action; succeeding this precocious spring weather we get a second edition of winter, of more or less duration; if of long continuance, we experience what in common language is termed a late spring, and all progress in vegetation above ground is checked, or kept at bay altogether; not so, however, the root, that is progressing and gathering strength for the coming demands upon its energy; and in proportion to its strength and healthy action so will be the progress of the branch when the conditions favourable for its development are present. On the other hand, an early spring, which is only another name for a warm one, is favourable to precocious development of leaf and branch; and that, too, before the root has gathered strength to support the demands upon it; and if the former once take precedence of the latter, in a plant growing in the open ground, the order of things can never be reversed. A plant existing under such conditions can never be otherwise than deficient in natural vigour. The constitutions of all ordinary plants resemble each other in this particular; if you place the bulb of a Hyacinth in a situation where its leaves and flower-stems are advanced before roots are made, you lose half the real beauty of the plant, and so of every other. *G. W. L.*

Page and Co.'s Blight Composition.—Being troubled with mealy bug I was led to try this composition, but I find that it will not kill it, and to my vexation I discovered that it burned the young tender leaves of such plants as Dipladenia crassinoda, Gardenia Fortuni, &c. Nor is this all; the smell was so offensive that no lady or gentleman could go into the house where it had been used for at least a week afterwards. *W. H. Good, Greenlands, Henley-on-Thames.*

"Calico" Potato exempt from Disease.—At p. 565 of your Number of August 25th, I find communications from several of your correspondents on the subject of the Potato disease, which is stated to have set in with severity in parts of Kent and Hants. It may be useful to such correspondents to know that there is a kind of Potato which has never been attacked by what is termed the Potato disease, and which is believed not to be liable to it. This Potato is called "the Calico," and is extensively cultivated in the township of Cornwallis, in King's County, Nova Scotia. It has this peculiarity—that the tubers and the tops grow simultaneously in this species, whereas in all other varieties the growth of tops precedes the formation of the tubers. So remarkable has been the exemption from disease of this sort of Potato, that many farmers of the township of Cornwallis, who were poor men a few years ago, are now in prosperous circumstances, the very general failure of the Potato crop for several consecutive years in various parts of the United States having caused a ready sale at high prices for their produce. *F.*

Planting.—I prefer to plant both evergreen and deciduous trees from the beginning of April to the beginning of July; my preference is founded upon extensive practice. Having, *nolens volens*, to move a great number of large bushes and trees one year, I commenced early in autumn and was not able to finish before midsummer. The trees moved correctly recorded what was best for them. Those transplanted in early autumn did pretty well; but as we gradually descended the scale of time to March, so did the appearance of the trees vary from green to russetty brown, and wan death-looking yellow, indicating as much as anything could do the months best suited for their removal, February and March being the worst. Those moved in April began to show that sap, life, and vigour had entered every spray, and they were not much hurt by the shift; those transplanted in May felt removal still less, and those in June never "looked over their shoulder." Since then I have planted many trees and shrubs of various dimensions, but have always found that the nearer midsummer the planting took place the better the success. I will here, by way of example, state what I did this season, leaving to others to prove by argument what they consider the best season for such operations. I planted between the 1st of April and the middle of July the following: 150,000 one-year old seedling Larch, of which I lost hardly any; 20,000 Birch, without loss; 20,000 Beech, of which very few died; 10,000 Alder, without any deaths; 100,000 Hazel and 30,000 Oak, with similar result, although they were not planted until the middle of June, when they had made from 6 to 9 inches of young growth. To the above must be added 80,000 Quick, of which none died; 12,000 Fruit Tree Stocks, of which not more than 60 died; 2000 Fruit Trees, of which not one died; 5000 Turkey Oak, without loss; 2,000 Roses, of which about 100 died; the latter were in full leaf when moved. Besides these there were 5000 shrubs and trees, of various deciduous kinds; these were not begun to be transplanted until the middle of May, and finished the last week in June, yet none died; the last planted are now the finest, the first planted the worst. Of 200,000 three-year old Spruce, all lived; I finished planting them the first week in July, and they are now beautiful healthy plants. Of 10,000 Spruce, from 2 to 4 feet high, all are alive and healthy. Of 20,000 Silver Firs, from 6 inches to 18 inches high, all grew; 3000 ditto, from 3 to 9 feet in height, were moved in June, when they had grown from 6 to 9 inches, yet not one died. Of 30,000 common Laurel from 1 foot to 3 feet high not one died, planted in the middle of June; 20,000 Hollies all grew, in fact this is the only safe time to move them. I could multiply instances of large numbers having succeeded when moved at this season, suffice that during the last 3 years I have moved upwards of 100,000, all of which grew; they average 2 to 5 feet, the largest of them had not been moved during 6 years, not since they were 6 inches high; some of them were when moved 6 feet high. 3000 Yews of all sizes to 6 feet; many of these were planted in a hedge, the middle of last year's July, during 3 or 4 intensely hot days, all but one grew; many hundreds of Portugal Laurel were moved at midsummer, all did well. 3000 Laurestinus moved in June did well. 1000 Laurestinus moved in October were very nearly killed. 2000 Evergreen Oaks, 4 to 7 feet, all moved in summer, only one died. 3000 small ditto, moved in June this year, all lived. and I could go on to show that hundreds, nay thousands, of Arbor-vitæ, Red Cedars, Deodars, Cedars of Lebanon, Pinuses, Cryptomerias, Junipers, &c., have been moved by me, and transplanted (many of them apparently hopeless cases) with hardly a failure. Surely I have now given examples enough—examples which can be seen daily by any one who may favour me with a call—to warrant me in advocating late spring and early summer as a good time for transplanting trees; in fact, when I have a fear of losing a tree by transplanting, I defer the operation until May or June. I may here offer one precaution which I have found requisite—viz., whenever a plant has made a start to grow, then is the time to move it; and never to move plants, as a general rule, after they have grown beyond 3 or 4 inches. To this rule Coniferæ, generally speaking, form an exception; many of them will not hurt if they have grown a foot. *John Scott, Merriott Nurseries, Crewkerne, Somerset.* [We should very much like to have the remarks of Mr. Scott's neighbours upon the experiments here described.]

What is Ozone?—This is a question that has been frequently asked within the last few years, but seldom have we met with persons capable of answering it, or of giving us any information as to what is really meant by the word. Without attempting to give a learned disquisition on the subject, it will perhaps answer every useful purpose if we bear in mind the definition that was given of ozone some two or three years ago in the *Gardeners' Chronicle* by a facetious writer, who called it "the smell of electricity." Nor is this definition inappropriate when we consider that the recently discovered agent is only a variable condition of oxygen, having a peculiar odour, by which its presence or absence in the atmosphere may be detected. The researches of chemists inform us that where there is much ozone respiration is impeded, and it proves fatal to small animals. Its chemical effects are most remarkable. It has a power similar to that of chlorine of bleaching vegetable colours, and produces the highest possible oxidation of most metals. From a communication lately made to the Royal Society by Dr. Andrews, Professor of Chemistry in Belfast, we learn that two substances have been thought to be confounded under the name of ozone, one a compound body, the other an allotropic variety of oxygen; but the result of his numerous experiments confirms the fact that ozone is formed by the action of the electrical spark on pure and dry oxygen, and that its properties, even when derived from different sources, are in every respect the same. Thus ozone, however prepared, is destroyed, or rather converted into ordinary oxygen, by exposure to a temperature of about 237° C. It is not absorbed by water, but when sufficiently diluted with other gases, is destroyed by agitation with a large quantity of water; and, contrary to the common statements, it is also destroyed by being agitated with lime-water and baryta-water, provided a sufficient quantity of those solutions be used. From the whole investigation Dr. Andrews draws the conclusion that ozone, from whatever source derived, is one and the same substance, and is not a compound body, but oxygen in an altered or allotropic condition. *W. B. B.*

Transplanting Machines—which is the best?—At page 582, a correspondent directs attention to a mode of determining this point, which (if practicable) certainly possesses some claim to the consideration of noblemen and landed proprietors who may be desirous of improving the scenery around their domains or mansions; but the practice of transplanting large trees applies more especially to laying out new places, when the object of the proprietor is to produce an immediate as well as the most picturesque effect which the extent, situation, and local circumstances of the place will admit of. The most striking effect of this kind, I believe ever produced in this country, is at the Right Hon. E. Strutt's, Kingston Hall, where some hundreds of large trees, varying in height from 15 feet to 40 feet, have been transplanted, and some trees of the latter height have been conveyed a distance of 15 miles; among these are now to be seen growing luxuriantly some fine specimens of Yew and Cedar of Lebanon. The machine employed for the purpose is somewhat similar to Mr. Barron's, but considerably improved, which the nature and the circumstances of the work required; at the same time it is but justice to Mr. Barron "to say" that to him belongs the merit of the invention of the original. Any person who wishes to form a correct idea of the merits of this machine, will do well to pay a visit to this establishment. If they happen to see the large vinery there when in full bearing (as I have), where upwards of 25 cwt. weight of Grapes are annually produced, they will be well repaid for their visit. *T. C., Tadcaster.*

Transplanting Large Trees at Gunnersbury Park.—You said in a paragraph in connection with my letter in the *Gardeners' Chronicle* of the 25th ult., that you did not know what I complained of—true; but it appears some of your correspondents were in the secret. Your report of the large trees transplanted at Gunnersbury Park would have remained unnoticed by me but for the unfair way (unintentionally on your part I dare say) in which I was made to figure in the notice. No doubt a certain meed of praise was intended for the person who had conducted the operations you mentioned so successfully. Now, not a word was said about any of the trees having been transplanted upon my system, or by my machinery, except one with a dead top! Was not this a "mistake?" [Our reporter did not know that more than one tree had been so moved. The statement was founded upon information given on the spot, at Gunnersbury.] I like to have mistakes rectified, especially when public interests are concerned. In the *Chronicle* of 1st inst., I find Mr. Forsyth says—"Mr. Barron is mistaken in stating that the major part of the trees here were moved under his direction, or that

of his man." "Such superintendence certainly did not extend to more than a fourth of the number transplanted here last autumn." I said "large trees," Mr. Forsyth leaves out large, and makes me say trees; I think this is a mistake. Most people can transplant shrubs or small trees with tolerable success, and I was not required to operate upon them; therefore I should be sorry to rob Mr. Forsyth of this honour, and to correct all further mistakes I hope he will furnish your readers with a correct statement of the names, numbers, and dimensions respectively of the large trees removed by my man and machines in September and October last, and also of those removed under his own superintendence afterwards. One more favour and I have done. Let us have the names, numbers, and dimensions of those he removed before my man taught him how to remove large trees. One word for your correspondent "Observer." I observe it is the best way to keep clear of those dangerous fellows who amuse themselves by skulking behind a bush, in order that they may indulge in a random shot without being seen. If he will throw away his popgun, and show himself among honest men who are never afraid of being seen, I can easily put him in a way to get the information he seeks for. I dare say he is not much disposed to pay for experiments. I have generally thrown my system open to all planters for the last 25 years, without charging anyone for instruction or royalty; and for upwards of 3½ years my system, with engravings of machines, has been open to the world in a published form; and unless "Observer" had been rather wanting in observation, he must have noticed that my system has long been an established fact, and not a thing depending upon his opinion. When he gives his name I am prepared to place my facts alongside of his opinions, for the benefit of the public. *William Barron, Elvaston Castle.*

Notices of Books.

Pescatorea. Iconographie des Orchidées de la Collection de M. Pescatore. Parts 6, 7, 8. Folio.

In the three parts now before us of this fine work we have representations of 12 of the most showy garden Orchids. Among these one of the most remarkable is *Cycnoches Pescatorei*, which Prof. Reichenbach distinguishes, as a new genus, naming it after Mr. Lüddemann under whose care the fine collection at the Celle-St. Cloud has long been placed. His merits entitle him to the compliment, in which his name is happily associated with that of M. Pescatore, his munificent patron. Another is *Cattleya elegans* of Morren, a very fine thing. A third is a good figure of *Cypripedium* or *Selenipedium caudatum, apropos* of which Prof. Reichenbach mentions three other long-tailed species, namely *S. Warczewitzii, Boissierianum* and *Czerwiakowianum*, the last of which names we should be thankful to know how to pronounce. Mr. Linden has contributed for a plate a most beautiful variety of *Odontoglossum maculatum*, the yellow and purple of which are as brilliant as anything in the whole order. Other plates are occupied by *Vanda cærulea, Coryanthes macrantha*, and *Schomburgkia undulata*, which we learn from the text has been named by some person *Deckeria speciosa!* Buyers of Orchids should remember the fact. We congratulate the authors of this brilliant work upon the continued success with which they obtain fine specimens for representation.

Could they not, without impropriety, occasionally admit plates of non-introduced species by way of variety, and for the purpose of guiding collectors to what is wanted. Suppose three or four species of the beautiful genus *Masdevallia*, such as *sanguinea, rosea*, &c., were put upon one plate; on another as many of the gigantic Peruvian *Pleurothallids*, very different from the uninviting things occasionally seen in cultivation; a third were occupied by *Chlorœas*, and a fourth by *Telipogons*, the most lovely of occidental Orchids, the interest of the Pescatorea would be greatly enhanced. Our friends Linden and Reichenbach could easily find the materials, and Riocreux would do the rest.

Taylor's Beekeeper's Manual (Groombridge) has reached a fifth edition. To those who want something good and cheap this may be recommended. But it must never be forgotten that beekeeping is like sheepkeeping, although it may be improved by precept, it can only be learned by practice; and also that the rudest contrivances, in a good bee country and in skilful hands, will prove infinitely more profitable than all the fine modern contrivances of boxes and boards, in the care of those who do not understand the subject.

Black's Guides to Hampshire and Derbyshire (24mo), are little directions for the guidance of tourists in these counties, well written, neatly got up, and as full of useful information as any reasonable man can expect for a shilling.

Mr. Herring has published a volume *on Paper and Paper-making*, ancient and modern (Longmans, 8vo, pp. 116), which, although of the slightest possible texture, will we doubt not be welcomed by those who are desirous of information upon a subject which is still shrouded in trade mysteries, and which deeply concerns us all.

Garden Memoranda.

Horticultural Society's Garden, Turnham Green.—In one of the pits here we observed a panful of young plants of Pampas Grass, raised from seeds presented by E. Brande, Esq., Fellow of the Society, and E. Hazlewood, Esq., of 15, Angel Court, Throgmorton Street. While speaking of this Grass it may be well to state that the fine plant of it which has been so much admired in the American garden here, but which was very much injured by the severity of last winter, has pushed strongly, and is again covered with green leaves. Before it suffered several offsets had been taken from it, all of which struck root freely.

Among novelties noticed in the above-mentioned pit, in addition to those named in our last report, were Begonia echinata, a pretty species with rough hairy leaves inclined to be variegated; B. villosa, a large-flowered kind raised from seeds imported with Botteri's dried specimens; a species of Dalea from the same collector; a Grass from Texas; and various plants raised from Sikkim-Himalayan, New Holland, and Guatemala seeds: the last were chiefly furnished by Mr. Skinner.

In one of the stoves was the curious hybrid Gesnerwort called Mandirola Roezli, mentioned at p. 451. It has large leaves somewhat resembling those of Gesnera zebrina, from among which it throws up a spike of handsome Gloxinia-like flowers. It is reported to be a cross between Scheeria mexicana and Gesnera zebrina, and is certainly a very pretty plant.

The Rose house is at present undergoing some repairs, and well do its occupants deserve such attention. Everybody knows how gay they have been all the summer, and with the little pruning-in which they received after the first bloom had begun to fade they promise to keep on flowering up to Christmas.

The Orchard house we need not say gets more interesting as its fruits become ripe; Apricots, Cherries, Gooseberries, and Currants, have all been gathered, and the trees are at present placed out of doors. Plums are an immense crop; Huling's Superb, a kind something like the Washington, Reine Claude de Bavay, Dennison's Superb, and others are, as we have before reported, loaded with fruits which on the last-named variety and the Early Prolific are nearly ripe. Peaches and Nectarines generally are also swelling fast; the Nutmeg Peach has been gathered, and Fairchild's Nectarine is nearly fit for table; the Stanwick as yet shows no signs of cracking, nor indeed of ripening. Pears, even on the very small trees, are a good crop, and the different varieties generally have done remarkably well considering the short time they have been in pots.

Vines, both in Ewing's glass wall and on open walls, have grown well this year and have plenty of fruit on them, but mildew has already made its appearance, although those out of doors were cleaned last winter, the loose bark removed, and the stems carefully painted with a mixture of tobacco water, sulphur, soft soap, and clay.

In the great conservatory one of the large Brugmansias, which serve so much to ornament this house, has been closely pruned and washed over with the composition just named. The other tree of this kind was treated in a similar way a short time ago; but it has now pushed strongly. Managed in this manner they bloom in succession, and keep the house longer gay than it otherwise would be. Hydrangeas now beautifully in flower are intermixed with the plants in the bed of this house, and during the present dull season are found to be very useful for the purpose.

In the orchard Pears and Apples on standards are a good crop, and even the young espaliers are bearing fruit; but, as we have before stated, there is little on dwarfs, the spring frosts having deprived them of most of their bloom. Among Apples gathered into the fruit room, the best at present is the Early Harvest, which was ripe this year on the 15th of August, but in ordinary seasons it is ready by the 1st. In shape it resembles a small Hawthornden; it has a crisp flesh with a rich brisk flavour. Like all early Apples it is rather precarious as to time of gathering, for if taken too soon it wants briskness, and if left too late its flavour is flat. Among Pears were some good Jargonelles from standards, also of Vallée Franche, an old French variety with a flavour something like that of the Moorfowl Egg. We also remarked fruit of the Summer St. Germain, an immense bearer and, like the Beurré de Capiaumont, a profitable Pear for market.

On the Peach wall there is plenty of fruit, which is now beginning to increase in size rapidly. We observed that a tree of the Shanghai Peach, on a Peach stock, had got the "yellows," but that another of the same variety and on the same kind of stock was green and healthy. The latter we were informed stands behind a chimney which runs up through the wall; it, therefore, has had more heat than the other. It may be mentioned that under Colonel Challoner's glass frame, which covers a tree on this wall, there is an excellent crop of Peaches, which are more forward than those on trees of the same kind that have had no such protection. By removing the sashes the fruit is now permitted to have abundance of air, without which, we need not say, it could not be expected to ripen in perfection, and the tree is thus kept in excellent health, and has made plenty of good wood for next year.

In the kitchen garden Spinach for winter use is just coming through the ground. Various kinds have been sown with a view to test their merits. Onions are a good crop here, and free from disease. One of the best sorts is the White Globe, which is also an excellent keeper. Onion d'Anvers, from Vilmorin, is a brown-coloured medium-sized kind, which is worth attention on account of its earliness.

Plants of Dioscorea Batatas, put out on an open border here under handglasses early this summer, have as yet succeeded no better than those of our correspondents, whose experience with this Yam has already been given at pp. 517, 582. Our climate evidently appears to be too cold for it.

The result of the trial of Peas sown on the 26th of June last, with the view of proving whether early or late sorts are best adapted for this season, is that Sangster's No. 1 is now fit for use, and that Prize-taker, a late sort, is very nearly so; while the Victoria and Milford Marrow are only in flower. On none of these Peas has any mildew appeared; as a preventive, however, they were all dusted with sulphur some three weeks ago, and now their health and vigour is such that even the latest of them cannot fail to yield a crop.

Miscellaneous.

Best kind of Sea-weed for Small Salt Water Aquaria.—In my previous experiments in this branch of the subject, commenced in January, 1852, and of which some results were communicated to the British Association at their meeting last year at Hull, I stated that the result of my experiments to ascertain the kind of sea-weed best fitted for maintaining the balance with the animal life was, under ordinary circumstances, in favour of the Chlorosperms, and that the Rhodosperms submitted to the like conditions did not answer the purpose desired and at the same time retain their colour and beauty, inasmuch as they very soon became coated with a growth of short green and brown Confervæ (Conferva tortuosa?), which entirely mantled the whole surface of the fronds and destroyed their characteristic appearance. During these investigations, however, it occurred to me that it might be possible to obviate this drawback, and I have I believe succeeded, after a series of experiments, in overcoming this inconvenience, and can now retain them in all their natural loveliness and render them quite efficient for all the purposes required, that is, as consumers of carbonic acid and generators of oxygen. The ground on which I have reasoned as a basis for these experiments has been the consideration, that nearly the whole of these red or pink-coloured sea-weeds are found either in deep water or under the shade of other Algæ, and from the fact that they were also often known to occur in shallow rock-pools; it was hence fair to assume that the pressure of the column of water could not be an important element in the production of these coloured growths, and therefore that it must depend upon a modification of the light. Hence my idea was that the effects of the depth of the water might be capable of being imitated by tinting the light through the interposition of coloured media, and thus all the results observed in the vegetation, and much even of the healthy animal life of deep sea-water could be, under this arrangement, assimilated; and this, I am happy to state, has proved experimentally to be the case, so that, by very simple means and with very little trouble, we shall be enabled to grow and preserve these elegant and beautiful plants in all their varied hues, as well as many of the wondrous forms of animal life usually found associated with them for any length of time; and thus a much enlarged field for observation will be brought within the limits of our aquarium. In order to obtain this desideratum, a medium having a blue or green tint has been had recourse to, and of such a nature as merely to colour, soften, or diffuse the light, without materially diminishing its quantity. This was at first accomplished by the employment of a thin film of paint of the desired shade, of a thin silk gauze of a blue colour, by layers of tissue paper tinged blue and green, sometimes oiled to render them more transparent, at others the sheets of paper being superposed until the desired effect was produced; or by coloured varnishes, blue, and blue and yellow, and mixed to the tint required. These materials should be applied to the surface of the glass, or interposed between the source of light and the water, in such a way that the whole of the light which directly illuminates the aquarium may be tinted of the proper colour. In proportion to the quantity of light at command and the varying aspect to the sun's rays, so must the transparency of the colouring medium be adjusted. In my own case, I have been obliged partially to employ coloured glass, as the other methods were found to impede too much of the direct light; but it must be borne in mind that this is in the midst of a crowded city, in a smoky atmosphere, and surrounded by tall houses. To such an extent has this plan succeeded, that several small attached pieces of delicate red sea-weed which I had received in October, 1852, and had become thickly mantled with the brown and green confervoid growth already alluded to, and which had not exhibited the least signs of vitality, on being placed in a small glass jar arranged with tinted and oiled tissue paper, soon lost the whole of this parasitic growth, from its gradually decaying, and being then consumed by the mollusks, the fronds assuming their deep crimson hue, becoming perfectly clear, and even, after so long a period, throwing out numerous young shoots or leaflets; and on one of these pieces several beautiful specimens of the Coryne sessilis made their appearance, together with groups of Lepralia and corallines. *Warington in Annals of Natural History.*

The Nut (Corylus avellana), is said by Pliny to derive the name of avellana from Abellina in Asia, supposed to be the valley of Damascus, its native country. He adds that it had been brought into Asia and Greece from the Pontus, whence it was also called nux pontica. Theophrastus calls these nuts by the name of Heracleotic Nuts, a name derived from Heraclea, now Ponderachi, on the Asiatic shores of the Black Sea. Hippocrates gives them the name of Carya thusia. Dioscorides says they were also known by the name of leptocarya, or small Nuts. Other ancient writers confound the Nut with the Chestnut and the Walnut. But all the above indications of importation from the East relate only to particular varieties, for the species, as is well known, is common enough in Italy, as in the rest of Europe and a great part of Asia, in a really wild indigenous state. *Journal of the Horticultural Society of London.*

Calendar of Operations.

(For the ensuing week.)

PLANT DEPARTMENT.

Conservatory, &c.—Hyacinths and other Dutch bulbs are now being offered by the dealers in this country, and should be procured and potted without delay where they are wanted for early forcing, and even where early forcing is not intended there will be a better chance of procuring first-rate bulbs now than some months hence; for as a matter of course the earliest purchasers endeavour to secure the most promising bulbs. Plants of the Citrus family meant for forcing in winter for the decoration of this house should now be fully exposed to the sun and air, in order to get their wood well ripened, upon which their flowering freely will greatly depend. The Mandarin Orange being a free grower, with a dwarf bushy habit and small foliage, and a most abundant bloomer, is probably the best for this purpose, but any of the varieties flower profusely provided the wood is thoroughly ripened in autumn. These and the deliciously fragrant Daphne indica are invaluable for winter blooming, and should be largely grown for this purpose wherever sweet-scented flowers are in demand at that season. Also see to having plenty of the old Salvia splendens, which is an exceedingly gay plant and very useful for mixing among the Chrysanthemums in the show-house. We have found it a good practice to place the largest plants of Salvias in a shady situation out of doors for a few weeks in autumn, and plants so treated will be found to bloom more strongly, and last longer in beauty than others run up in a warm house.

Greenhouse. — Look carefully after the watering of large specimens of hard-wooded things, especially Heaths and other fine-rooted plants, which are soon injured by being either over or under-watered. Examine the specimens often and carefully, and where they are found to be dry water thoroughly, so as to moisten the whole of the ball; also look sharply after mildew on the soft-wooded Heaths, and dress the plant with sulphur directly the enemy is perceived. These will, however, be mostly out of doors, where mildew is seldom troublesome, but they must be guarded against getting too wet at the root—laying the pots on their sides during heavy rains, especially plants that have been recently repotted. Get Azaleas that have set their buds tied into form as soon as can be done, in order to give them a neat appearance. Also attend to the staking and training of other things as leisure time can be found. Look carefully after red spider on Bossiæas, Chorozemas, and anything else found to be liable to this pest, and see that it is eradicated before the plants get disfigured. Page & Co.'s composition, according to some parties, appears to be a cure for all kinds of insect pests, but there must be different samples of this sent out, for we had much the same success with it as Mr. Gordon (see p. 488), who seems to have found it about as useful as soap-suds. Red spider is, however, easily got rid of by laying the affected plant on its side, and well washing the under sides of the leaves with the engine, applying the water with as much force as the foliage will bear. Shake out and repot Pelargoniums that are sufficiently advanced after having been cut back, keeping them rather close and moist until they strike into the soil. But plants that are fairly established after repotting can hardly be too freely exposed to air, or kept too cool. Also keep Cinerarias cool and moist, and attend to repotting such as require it, and fumigate immediately aphides are perceived upon any of the plants. Primulas must also be carefully attended to, in order to encourage them to make rapid growth, particularly the double varieties, which are hardly surpassed as useful subjects for winter decoration. Keep Tree Violets clear of their great enemy, red spider, by a liberal use of the syringe, and give them plenty of manure water, which will assist in keeping them in vigorous health.

FORCING DEPARTMENT.

Pineries.—Where the pot system of cultivation is practised, any of the stock which may appear to require repotting should be examined and shifted at once, if this is found necessary, in order that the roots may get hold of the fresh soil before dull cloudy weather sets in, when it will not be safe to encourage free growth. And any necessary re-arrangement of plants growing in the open bed should also be effected as soon as possible, as with a little care in shading on bright days and keeping the atmosphere moist, this can be effected at present with very little risk of checking the plants, so as to throw them into fruit, and there is also plenty of time to get them well established after removal before the dormant season. Encourage plants expected to show fruit next January to make vigorous growth, for these should be sufficiently advanced by the middle or end of next month to allow of keeping them rather cool and dry through November and December, so as to check and thoroughly mature their growth, as unless this is attended to there will be considerable risk about getting them to show fruit at that season. Plants which have been prepared for fruiting, and which it is desired to get up at once, should be encouraged with a moist warm atmosphere, keeping the soil about their roots in a healthy state as to moisture. Some persons have a dread of applying water at the root in the case of plants that have been kept dry for a time to check growth, and withhold it until the fruit is perceptible; but this is an error, causing loss of time as well as injuring the plants, as unless root action is encouraged, plants cannot be expected to start freely. If artificial treatment must be resorted to in order to get the plants to fruit at the desired time, there is no method so certain or so little injurious to the plants as keeping them cool and dry for a month, exposing them to as much sunshine as the foliage will bear without scorching, and then affording them a moist warm temperature and a brisk bottom-heat, giving sufficient water at the root to properly moisten the soil. Take off and pot, or plant out suckers at short intervals as they can be obtained of sufficient strength, for having a regular succession of plants is the most likely way to secure a regular supply of fruit. Vineries.—Take advantage of the present dry weather to give air freely in houses where the ripening of the wood is the object, and if a little fire heat is used, with air, this will be much more efficacious now than later in the season, when the sun will be less powerful. But save in the case of young Vines with a very gross habit it will hardly be necessary to use fire heat while the weather continues dry and sunny. Keep the surface of the border in a free open state, so as to encourage evaporation, for keeping the roots too wet is the main cause generally of the wood being backward in ripening at the proper time. Figs.—Where the second crop is ripening keep the atmosphere as dry as can conveniently be done, and also let the trees be on the side of dryness at the root, but avoid such a degree of dryness as would be likely to injure the foliage or the bearing wood for next crop. Keep the shoots thin and neatly tied in, so as to expose it fairly to light and air, but avoid stopping young shoots at this season. Keep the atmosphere moist where the fruit is swelling, giving the foliage a good washing with the syringe frequently to prevent red spider, and give plants in pots or tubs a liberal supply of manure-water. Melons.—Take advantage of bright weather to give the soil a good soaking of water where this is necessary, and also to trim the vines, removing all useless laterals, &c., which is best done in bright weather, as then there is little danger of the canker ensuing. Give air as freely where the fruit is ripening as the state of the weather will permit, and keep the atmosphere as dry as possible. If any of the late plants are unfortunately infested with spider, play the syringe morning and afternoon as freely as can be done without injuring the foliage; and use every means to get the plants perfectly clean while the syringe can be used without danger of damp, &c. Where a supply of Cucumbers is required through the winter vigorous young plants should be procured at once, either from seed or cuttings, as plants that have been bearing through the autumn, however promising they may look at this season, seldom answer well for winter fruiting.

FLOWER GARDEN AND SHRUBBERIES.

The stock of cuttings should be carefully looked over to see that nothing has been omitted, and that a sufficient quantity of everything is in a promising state for making nice stocky plants before winter, and if it is found that the stock of anything is insufficient not a day must be lost in getting in cuttings, for it is already late in the season for this kind of work, and it will be well to bear in mind that plants of things which are at all difficult to winter rooted after this season may be considerably thinned before spring, and also that they will not be sufficiently strong to furnish many cuttings for spring propagation, and consequently to provide a larger quantity than would have been necessary had the cuttings been put in a month ago. But if there is a reserve stock of strong plants in pots, which is a safe practice where there is a large quantity of bedding stuff required, and proper convenience for growing them and propagating in spring, these will furnish a large quantity of cuttings next March which will form equally good plants by turning out time as cuttings put in now. In the case of such things as Ageratums, Heliotropes, and dwarf Lobelias, it is useless wintering young stock, as these grow so freely in heat, and are so easily propagated from soft cuttings that a few good sized old plants which require but little room or attention in winter will furnish a very large quantity of plants by turning out time. See, however, where there are not plants to furnish spring cuttings, that plenty are got in at once, so as to provide while it can be done against the risk of being short of stock at turning out time. Attend to the potting of such cuttings as are sufficiently rooted, and give every after attention to these in order to get them well established before winter. Sow hardy annuals in the reserve ground for transplanting to assist in furnishing an early display next season, for which they are exceedingly useful. Persevere with mowing and other routine work, and go over the beds frequently, removing dead flowers, &c., and while the garden is in full beauty, spare no effort to have everything in and about it in the best possible state of keeping.

HARDY FRUIT AND KITCHEN GARDEN.

Take advantage of the present dry state of the ground to get Celery earthed up, first thoroughly soaking the lines with manure water, also apply quicklime where slugs are troublesome. On heavy soils it is sometimes necessary to surround the plants with sand or sifted ashes to prevent their rotting off in winter, which they are apt to do if surrounded with soil that holds much water. Where anything of this kind is necessary it will be advisable to defer earthing up till later in the season, as frequent soilings of this sort would be very troublesome. Also pull Onions where ripe, and get them dried while the weather is favourable. Thin young crops of Turnips, Spinach, &c., before they become weakly and drawn, through standing too closely together. Stir the surface of the soil deeply among growing crops, to admit air to the roots, and keep down weeds. Let nothing suffer for want of water, especially recently planted Strawberries; these will be benefited by liberal applications of manure-water. Get spare ground manured and dug or trenched for another crop whenever time can be spared for this kind of work.

STATE OF THE WEATHER AT CHISWICK, NEAR LONDON,
For the week ending Sept. 6, 1855, as observed at the Horticultural Gardens.

August and Sept.	Moon's Age.	Barometer.		Temperature.					Wind	Rain.
				Of the Air.			Of the Earth			
		Max.	Min.	Max.	Min.	Mean	1 foot deep.	2 feet deep.		
Friday 31	19	30.210	30.181	78	41	59.5	65½	61	E.	.00

Satur. 15	66.6	46.5	56.6	15	0.63	—	5	4	2	7	1	5	5

The highest temperature during the above period occurred on the 12th, 1841—therm. 84 deg.; and the lowest on the 9th, 1851, 11th, 1854, and 12th, 1848—therm. 31 deg.

Notices to Correspondents.

Apricots: *Cardiff.* Arrived quite safely this time, although misdirected.

Books: *Sub.* Barron's "Winter Garden."—*J Br.* We cannot assist you. If the publishers do not continue to sell the "Vegetable Kingdom" in parts, we presume that they have reasons for refusing. At all events it is no affair of ours.

Californian Laurel: *J N L.* Sow the seeds in pans now—taking care not to bury them too deeply—and winter them in a cold frame. They will come up in spring. ‡

Fir Trees: *W P.* Single specimens may be transplanted any time between Sept. 1 and Oct. 30, provided proper precautions are taken. If the operation is on a large scale with small plants wait till November.

Fleas: *Voyageur.* No plant growing in this country is known to have the power of repelling vermin. Both the common Chrysanthemum Leucanthemum and Inula Pulicaria are *said* to possess the property—but we cannot vouch for it. It is not known what plant is used in preparing the Piré-oti of Orientals.

Glass: *Subscriber.* We are decidedly of opinion that *Hartley's* rough horticultural plate glass is the best for Melon pits. It is altogether a mistake to suppose that Hartley's glass does not transmit light enough. We speak from experience.

Heating: *J K R.* A common flue is the least expensive mode of heating your small greenhouse, and it will be found quite sufficient to keep frost out of it.‡

Hollies: *D Q.* They do not form berries because the flowers are destroyed by cold in spring.

Insects: *W D.* Your Pear and Cherry trees are infested with the slimy grubs or larvæ of the black-winged sawfly, Tenthredo (Blennocampa) æthiops. Dust the leaves with lime or syringe them with lime-water. A boy with a large camel's hair pencil dipped in the lime will be able to destroy all the grubs on a tree in a quarter of an hour, touching each grub with the brush. This is a more certain and less unsightly plan than dusting the trees indiscriminately.—*Q H.* See the last answer; you will find the history and figure of the insect in *Gardeners' Chronicle*, 1842, p. 692. Its appearance is in no ways connected with the darkness which suddenly came over Blackheath a fortnight ago.—*M J B.* Your larvæ feeding on the parenchyma of Geranium leaves are the very young caterpillars of one of the Noctuidæ, most probably Mamestra oleracea.—*W B.* The insects found on your Juniperus Virginiana are apparently young wingless individuals of Lachnus Juniperi, of De Geer (Mem. III., tab. iv., fig. 7.) Fumigation under a parapetticoat would destroy them.—*A Constant Reader.* The yellow flies which have attacked your Pear leaves are a small froghopper (Typhlocyba flavescens?). Dusting the leaves with lime will prevent them attacking the parts covered with the dust; but as the insects are very active, and the lime cannot be made to cover the leaves entirely, the flies cannot be thus destroyed. A few sheets of paper coated with the slimy matter used for the common fly-papers and laid under the trees, the leaves of which should then be shaken, would destroy numbers of them. *W.*

Names of Fruits: *T C.* Red Astrachan Apple. ‖

Names of Plants: We have been so often obliged to reluctantly decline naming heaps of dried or other plants, that we venture to request our correspondents to recollect that we never have or could have undertaken an unlimited duty of this kind. Young gardeners, to whom these remarks more especially apply, should bear in mind that, before applying to us for assistance, they should exhaust their other means of gaining information. We cannot save them the trouble of examining and thinking for themselves; nor would it be desirable if we could. All we can do is to *help* them—and that most willingly. It is now requested that, in future, not more than four plants may be sent us at one time.—*J.* Rosa microphylla and Clethra arborea. —*J O'B.* Pteris aspericaulis Wall., a native of Nepal and other parts of India. *S.*—*R A A.* Physianthus albens, a Mexican plant.—*Erzeroum.* 378 and 118, Astragalus aduncus; 529, Ast. echinus; 332, Astr. Lagurus; 1382, some form of Pinus Pumilio. —*T C.* Campanula Loreyi.

Pæony-seeds: *E A G.* Sow them now in pans, in light loam and peat. Just cover them with soil; keep them on the north side of a wall, and they will come up next year or the year after. Do not water them, but let them take their chance of weather.

Russian Mats: *A Correspondent* says, in answer to "R. G. F.," that the best substitute for these is Frigi Domo, *if of good quality;* but he adds that it will not do for packing or tying purposes.‡

Scotch Firs: *A Sub.* The enemy is the well-known Hylurgus piniperda. The subject is so important that we will refer to it at length next week.

Sir Harry Strawberry.—The letter from Lancaster is an advertisement. The inquiry by Fragaria has been sufficiently answered already. No doubt the Strawberry in question is a good one.

Misc.: *T T.* All stove plants except Erythrina laurifolia and Statice Holfordi.

*** As usual, many communications have been received too late and others are unavoidably detained till the necessary inquiries can be made. We must also beg the indulgence of those numerous correspondents, the insertion of whose interesting contributions is still delayed.

THE FOLLOWING MANURES are manufactured at Mr. LAWES' Factory, Deptford Creek:—Turnip Manure, 7*l.* per ton; Superphosphate of Lime, 7*l.*; Sulphuric Acid and Coprolites, 6*l.*

Office, 69, King William Street, City, London.

N.B. Genuine Peruvian Guano, guaranteed to contain 16 per cent. of ammonia. Nitrate of Soda, Sulphate of Ammonia, and other Chemical Manures.

THE LONDON MANURE COMPANY'S NITRO-PHOSPHATE OR WHEAT MANURE FOR AUTUMN SOWING.—This Manure, composed of blood, animal matter, and dissolved bones with silicates, is most strongly recommended to the notice of Agriculturists. It contains from 7 to 8 per cent. of nitrogen, in a form yielding ammonia by slow decomposition, and is therefore particularly adapted for Wheat. The quantity required is 2 to 3 cwt. per acre drilled in with the seed. Price, per ton, 7*l.* 10*s.* in London.

PERUVIAN GUANO, FISHERY SALT, and every other MANURE on best terms, strictly warranted.

40, Bridge Street, Blackfriars. E. PURSER, Sec.

CAUTION.

PARKES' STEEL DIGGING FORKS AND DRAINING TOOLS.

Whereas very inferior descriptions of Steel Digging Forks are now manufactured and sold, and I have been informed that purchasers of the same have believed them to be the same as those manufactured by me, and to which the Royal Agricultural Society and numerous Agricultural Societies' prizes have been awarded, I hereby respectfully inform the public that every Fork manufactured by me is stamped with my trade mark "J. P.," and that Messrs. BURGESS & KEY, of No. 103, Newgate Street, London, are my sole Wholesale Agents, and I have authorised them to replace to the purchaser every Fork of my manufacture found defective; they will also on application send Wholesale and Retail Price Lists, &c., post free. FRANCIS PARKES & Co.

FIRST PRIZE REAPING MACHINE.

NOTICE.

MESSRS. BURGESS AND KEY beg respectfully to inform the public, and particularly the noblemen and gentlemen whose orders they were obliged to decline for this season on account of the manufacture not being fully arranged, that the Royal Agricultural Society's First Prize of 30*l.* was awarded to them for M'Cormick's Reaper, with their patent screw platform, at the trial at Leigh Court, near Bristol, upon the 29th of August last. Amongst the competing machines were Bell's, by Crosskill; Forbush's, exhibited by Mr. Palmer; and Hussey's, with tilting platform, by Wm. Dray & Co. The reports of farmers who have worked the machines during this present harvest, show that the average quantity of Wheat, Barley, and Oats which they cut was from 1¼ to 1½ acre per hour. Two horses work the machine with ease, and the only attendant required is a man or a boy to drive. Further particulars and prices sent free on application.—BURGESS & KEY, 103, Newgate Street; and 52, Little Britain, London.

PAXTON WORKS, SHEFFIELD.

SAYNOR AND COOKE, Manufacturers of the celebrated Exhibition Prize PRUNING, BUDDING, and GRAFTING KNIVES, VINE and PRUNING SCISSORS, &c. These articles are Warranted to stand any kind of work, and to carry the keen edge of a razor without requiring to be sharpened so frequently as is usually necessary to obtain that sharp edge so requisite for the comfort and use of the practical gardener. The blades are also warranted to wear through to the back. They are used by all the eminent gardeners in England, Ireland, and Scotland, and can be purchased of any nurseryman or seedsman in the three kingdoms. Those who may not have used them are respectfully solicited to give them a trial. The Great Exhibition Prize Medal of 1851, and the Prize Medal of the Horticultural Society of Manchester, at their Show of 1854, was awarded to SAYNOR & COOKE for their superiority of material and workmanship. Established 1738.

PORTABLE STEAM THRESHING MACHINES.—The time run by the four highest Portable Steam Engines at the Carlisle Meeting of the Royal Agricultural Society in July last, with 14 lbs. of coal to the horse power, was:—

Tuxford & Sons	3 hours and	47 minutes.		
Clayton & Co.	3	do.	27	do.
Barratt & Co.	3	do.	10	do.
Hornsby & Son's...	2	do.	54	do.

At the North Lincolnshire Society's meeting at Boston, in August last, Tuxford's and Hornsby's Engines again came into competition, when Hornsby's was again left a long way behind, with 14 lbs. of very inferior coal; the time run was:—

Tuxford & Sons	3 hours and	3 minutes.		
Hornsby & Son's...	2	do.	43	do.

And had the testing apparatus which was supplied to the society from Grantham not indicated the steam pressure falsely by several pounds on the inch, the difference would have shown fully twice as much to the advantage of Tuxford & Sons' Engine.

At the recent trials of Threshing Machines at the Paris Universal Exhibition, M. Tresca, the Government Engineer, employed as the motive power one of Tuxford's Portable Machines which had been purchased by the French Government.

The COMBINED THRESHING, SHAKING, and DRESSING MACHINE of Tuxford & Sons, was "highly commended" this year by the Royal Society at Carlisle; the Bath and West of England Society at Tiverton, &c.

Illustrated Catalogues, with prices, forwarded on application to TUXFORD & SONS, Engineers, Boston, Lincolnshire.

"FRIGI DOMO."—Patronised by her Majesty the Queen, the Duke of Northumberland for Syon House, His Grace the Duke of Devonshire for Chiswick Gardens, Professor Lindley for the Horticultural Society, Sir Joseph Paxton for the Crystal Palace, Royal Zoological Society, Mrs. Lawrence, of Ealing Park, and — Collier, Esq., of Dartford.

THE BEST PROTECTOR FROM THE HEAT OF THE SUN.

"FRIGI DOMO," a Canvas made of patent prepared Hair and Wool, a perfect non-conductor of Heat and Cold, keeping, wherever it is applied, a fixed temperature. It is adapted for all horticultural and floricultural purposes, for preserving Fruits and Flowers from the scorching rays of the sun, from wind, from attacks of insects and from morning frosts. To be had in any required length, 2 yards wide, at 1*s.* 6*d.* per yard run, of ELISHA THOMAS ARCHER, whole and sole manufacturer, 7, Trinity Lane, Cannon Street, City, and the Royal Mills, Wandsworth, Surrey; and of all Nurserymen and Seedsmen throughout the kingdom. "It is much cheaper than mats as a covering."

CARSON'S ORIGINAL ANTI-CORROSION PAINT, specially patronised by the British and other Governments, the Hon. East India Company, the principal Dock Companies, most public bodies, and by the nobility, gentry, and clergy, for out-door work at their country seats. The Anti-Corrosion is particularly recommended as the most durable out-door Paint ever invented, for the preservation of every description of Iron, Wood, Stone, Brick, Compo, Cement, &c., work, as has been proved by the practical test of upwards of 60 years, and by the numerous (between 500 and 600) testimonials in its favour, and which, from the rank and station in society of those who have given them, have never yet been equalled by anything of the kind hitherto brought before the public notice.

Lists of colours, prices, together with a copy of the testimonials, will be sent on application to WALTER CARSON & SON, 9, Great Winchester Street, Old Broad Street, Royal Exchange, London. No Agents. All orders are particularly requested to be sent direct.

MAPPIN'S PRUNING KNIVES IN EVERY VARIETY, WARRANTED GOOD BY THE MAKERS.

JOSEPH MAPPIN AND BROTHERS, QUEEN'S CUTLERY WORKS, Sheffield; and 37, Moorgate Street, London. Drawings forwarded by post.

WARNER'S 4½-inch IMPROVED LIQUID MANURE PUMP, with Ball Valve, fitted with 1½ inch Brass Union for attaching flexible suction, with strong wrought iron Straps for screwing on to any ordinary Water-butt or Cart, as shown in drawing.

Price of Pump and Union, 50*s.*

1½-inch Flexible Rubber and Canvas Suction for ditto, 3*s.* 6*d.* per foot.

1½ Gutta Percha Suction, 1*s.* 6*d.* per foot.

WARNER'S IMPROVED LIQUID MANURE OR GENERAL PORTABLE PUMP.

The valve is a ball of imperishable material, and cannot clog in action. The barrel is of galvanised iron, not likely to corrode, and can be raised or lowered at pleasure. The legs will fold together, and the whole may be carried on shoulder to any pond or tank required.

Price of 4½ in. Pump, with legs, 3*l.* 3*s.* The barrel is 27½ in. long, and the legs are 5 ft. high.

1½ inch Gutta Percha Suction Pipe, 1*s.* 6*d.* per foot.

1½ inch Flexible Rubber and Canvas Suction Pipe, 3*s.* 6*d.* per foot.

May be obtained of any Ironmonger or Plumber in town or country, at the above prices, or of the Patentees and Manufacturers, JOHN WARNER & SONS, 8, Crescent, Jewin Street, London.

Every description of Machinery for Raising Water, by means of Wheels, Rams, Deep Well Pumps, &c.; also Fire and Garden Engines, &c.—Engravings sent on application.

WARNER'S PATENT VIBRATING STANDARD PUMPS.

PATENT CAST-IRON PUMPS, for the use of Farms, Cottages, Manure Tanks, and Wells of a depth not exceeding 30 feet.

Diameter of Barrel	Length of Barrel, under nose.		£	s.	d.
2½ in.	short 1 ft. 7 in.	Fitted for lead, gutta percha, or cast iron flanged pipe, as required.	1	12	0
2¾ „	long 3 „ 3 „		1	15	0
3 „	ditto 3 „ 6 „		2	12	0
3½ „	ditto 3 „ 6 „		2	18	0
4 „	ditto 3 „ 6 „		3	5	0
2½ „	short, with 15 feet of Lead Pipe attached, and Bolts and Nuts ready for fixing		2	12	0
2½ in.	long ditto	ditto ditto	2	15	0

The short barrel Pump is very convenient for fixing in situations of limited height and space, for the supply of coppers and sinks in Wash-houses with soft water from underground tanks, or in Hot, Forcing, and Plant Houses; they may be fixed, when desired, under the stage.

May be obtained of any Ironmonger or Plumber in Town or Country, at the above prices, or of the Patentees and Manufacturers, JOHN WARNER AND SONS, 8, Crescent, Jewin Street, London.

Every description of Machinery for Raising Water, by means of Wheels, Rams, Deep Well Pumps, &c.; also Fire and Garden Engines, &c. &c.—Engravings sent on application.

WARNER'S SWING WATER-BARROW (TO HOLD THIRTY GALLONS)

Is intended for all large Establishments where much watering is done by the watering-pot. By its use much time and labour of the Gardener are saved, particularly where the Tank, Pond, or Pump, is at a distance from the garden. May be obtained of any Ironmonger in town or country for 3*l.* 3*s.*

Manufactured by

JOHN WARNER & SONS, 8, Crescent, Jewin Street, London.

JOHN WARNER AND SONS, Crescent, Jewin Street, London.

GALVANISED IRON TUB GARDEN ENGINE, WITH WARNER'S REGISTERED SPREADER,

is strongly recommended, for durability and low price, viz., 2*l.* 19*s.*, to hold 10 gallons.

Larger sizes in wood or iron, viz., 14 gals., 24 gals., & 35 gals. May be obtained of any Ironmonger or Plumber in town or country, or of the Patentees and Manufacturers, as also Machinery of all kinds for raising Water from any depth to any height by Steam, Horse, or Manual Power. Prices sent on application. Syringes of various constructions and sizes from 9*s.* upwards. Metallic String from 5*d.* to 1*s.* 3*d.* per lb.

ROYAL AGRICULTURAL COLLEGE, CIRENCESTER.

Patron—His Royal Highness Prince ALBERT.
President of Council—Earl BATHURST.
Principal—Rev. J. S. HAYGARTH, M.A.
Professors, &c.:—
Chemistry—J. A. C. VOELCKER, Ph.D., F.C.S.
Zoology, Geology, and Botany—JOHN BUCKMAN, F.G.S., F.L.S.
Surveying, Civil Engineering, and Mathematics—F. ARMSTRONG, C.E.
Manager of Farm—G. AUSTIN.

Students are admitted after the summer and winter vacations, also in April and October. The annual fees for boarders vary from 45 to 80 guineas, according to age and other circumstances. The fee for out-students is 40*l.* per annum. The College course of lectures and practical instruction is complete in one twelvemonth, although a longer course is recommended. There is a department for general as well as for agricultural purposes. Prospectuses and information can be had on application to the Principal.

COLLEGE OF AGRICULTURE AND CHEMISTRY, AND OF PRACTICAL and GENERAL SCIENCE, 37 and Lower Kennington Lane, Kennington, near London.

Principal—J. C. NESBIT, F.G.S., F.C.S., &c.

The system of studies pursued in the College comprises every branch requisite to prepare youth for the pursuits of Agriculture, Engineering, Mining, Manufactures, and the Arts; for the Naval and Military Services, and for the Universities.

Analyses and Assays of every description are promptly and accurately executed at the College. The terms and other particulars may be had on application to the Principal.

ARTIFICIAL MANURES, &c.—Manufacturers and others engaged in making ARTIFICIAL MANURES may obtain every necessary instruction for their economical and efficient preparation, by applying to J. C. NESBIT, F.G.S., &c., Principal of the Agricultural and Chemical College, Kennington, London. Analyses of Soils, Guanos, Superphosphates of Lime, Coprolites, &c., and Assays of Gold, Silver, and other Minerals, are executed with accuracy and dispatch. Gentlemen desirous of receiving instructions in Chemical Analyses and Assaying, will find ample facility and accommodation at the College.

DRAINAGE OF LAND.

MR. HUMBERT, of Watford, Herts, a practical Surveyor and Land-Agent of more than 15 years' standing, offers his services to Gentlemen about to drain Land and Bogs. He will undertake to set out and superintend himself the execution of the work at a charge of 5*s.* per acre, and the expenses incurred in his travelling; or he will contract to complete it in a specified manner to the satisfaction of the Inclosure Commissioners at a fixed price per acre. Mr. Humbert has drained strong stony land in the most careful and complete manner, with 1¾ inch pipes, and proper mains, the drains being 4 feet deep and 30 feet apart, at 4*l.* per acre and under, and he can give reference to his employers in that and in other instances.

Watford, Herts, Sept. 8.

The Agricultural Gazette.

SATURDAY, SEPTEMBER 8, 1855.

THE subject of Agricultural Statistics is probably exhausted in the report of the Lords Committee appointed to inquire into it, which has just been published. Mr. HALL MAXWELL, Sir J. WALSHAM, and Mr. HAWLEY, and others who have superintended the experiments hitherto made and the successes hitherto achieved in this direction have here recorded their experience and their opinions. Mr. CAIRD, Mr. TORR, Mr. LEONE LEVI, and other gentlemen practically engaged in agriculture, or students of its relations to the general interests of the country, have also been called on for such information and advice as they could give. And the committee, as the result of all this comparison and in some instances contest of opinion and of information, have arrived at a report, from which we extract the following paragraphs:—

"1. That the systematic collection of agricultural statistics throughout the United Kingdom is an object of national importance, and that amongst the many classes that would benefit by it, none would derive greater advantage than those connected with agriculture.

"2. That it is expedient that powers should be given by Act of Parliament to compel the occupiers of land to make the necessary returns, in case of their neglect or refusal to do so.

"3. That the Board of Trade should be intrusted with the general superintendence of the collection of the statistics in Great Britain, through the medium of the Poor-law machinery in England, and the Highland Society in Scotland; and that the Irish Government, in continuing to superintend the collection for Ireland through the agency of the constabulary, should from time to time consult with the Board of Trade on the subject, for the purpose of securing as much uniformity as possible in the returns obtained for the different portions of the kingdom.

"4. That two classes of returns should be annually obtained, the first containing facts and the second estimates; and that the facts should consist of returns of live stock, and of the acreage under each description of crop, while the estimates should consist of estimates of the produce of the harvest. The acreage and stock returns should be sent in by the 15th July, and the estimate returns made up between the 1st and 30th of November.

"6. That the inquiries should not be required to extend below holdings of two acres in England and Wales."

These conclusions seem borne out by the evidence in the Blue book which accompanies the report, and we may presume therefore that we shall next year have a greatly enlarged development, in England at any rate, of the experiments made in some of the counties with reference to last year's crop, while in Scotland, where complete success has been achieved, the matter will properly remain in the hands of the

Highland Society and their indefatigable secretary Mr. Hall Maxwell.

It appears from the perusal of the evidence that there are three plans proposed for the collection of the information sought—that of the Board of Trade, by which schedules placed in the hands of individual occupiers are collected by parish or union officers, and collated at a central Government office, which is responsible merely for the arithmetical process of addition, and for the correct publication of the result: that of Mr. Hall Maxwell, by whom in his capacity of Secretary to the Highland Society schedules are in like manner issued, received, and collated—he wielding, however, something more than the influence which Government possesses, seeing that there has been a long standing and inherited relationship existing between Scottish farmers and their national Agricultural Society which gives to the former confidence in the requests and recommendations of the latter, while it gives to the latter reasonable confidence in the good faith and intelligence of the former: and, lastly, there is the plan of Mr. Caird, who would employ district officers having such an extent of land under his supervision as he could traverse in the three months before harvest, visiting all the occupiers of it during that time, and ascertaining from them the acreage of the several crops. These inspectors would thus furnish the acreage of the several crops before harvest, and having access to parish maps and other sources of information, they would be to a certain extent a check upon the inaccuracies of the returns of the several occupiers. So far the result of their labours would be the same as that furnished by Mr. Hall Maxwell's correspondents; but there would be this special advantage in connection with Mr. Caird's plan, that a series of official reports of the prospects of harvest would be obtainable during the few months of summer from qualified reporters scattered over the country at the rate of about five to a county—reports which would furnish the best information possible at a time when correct information on the food prospects of the country is especially valuable. After harvest these reporters would, on their own responsibility, return their judgment of the crops with reference to that very vague term which is called "the average of the district," and we should learn the united opinion of these officers as to the extent to which the produce has exceeded or fallen below an average. Mr. Hall Maxwell's reports of the harvest are the opinions of committees not as to the relations of the crop to "an average," but as to the actual yield per acre—and we suppose that the estimate of a crop formed by any one who has walked through it is generally given in this form rather than in the other: he concludes in the first place that it is so much per acre, and *then* he perceives that it is so much above or below what is generally yielded. Mr. Caird's *inspectors* will no doubt obtain and avail themselves of the assistance of the farmers in forming their own conclusions as to the probable yield per acre, and so far their returns would probably be as trustworthy as those of Mr. Maxwell's committees; and after all, it matters very little whether the gross produce of a district be obtained by multiplying the acreage into the surplus or deficiency per acre, and adding or subtracting that from a total average yield previously calculated, or by multiplying the acreage into the directly estimated yield per acre of the district—the latter is the simpler method, and proceeds upon data that must be taken for granted in the other case as well. The methods of determining the acreage of the crop are the really important features of the several plans; and while we think Mr. Maxwell's plan under the circumstances personal and national in which he and Scottish farmers are placed should be persevered in, there can be little doubt that the method of paid and responsible inspectors of districts, suggested by Mr. Caird, is much superior to that which has been hitherto pursued in England, by which the returns are obtained through the intervention of the Board of Guardians. There is a good deal of force in the objection of Mr. Maxwell to the employment of any machinery that would connect in the mind of the farmer the returns he was asked for with any possible use of them for the purposes of taxation; and, on the other hand, there is undoubtedly great force in Mr. Caird's objection to all plans which have not within them the operation of a test of the accuracy of the returns received. Such a test, whether merely occasional, and so to speak accidental, as in Mr. Maxwell's plan, or systematic and inherent as in Mr. Caird's, will ensure the greater trustworthiness of the results of the inquiry as year by year it is repeated; the absence of any such test may result in untrustworthy conclusions, which, making trade calculations false instead of uncertain, as at present they are, will make so-called agricultural statistics more an evil than at present the absence of them is.

The effects of Climate on Fertility are but little under our control. Such ability as we have depends upon the influence of shelter and of drainage, together, let us add, with the adoption of such means for supplying food as shall enable a plant more rapidly to attain maturity, and so complete its growth during the best season of the year. We have no power over the constitution of the plant itself. The idea of acclimatation by the influence of habit on the plant is founded in mistake. Our highest authority on such subjects is perfectly clear on this point:—"Nothing seems more perfectly made out," he says, "than that all plants demand a particular climate—that is to say, a peculiar combination of temperature, moisture, light, and atmospheric pressure, in order to arrive at perfection; and that all considerable disturbances of the proportion in which such combinations are naturally provided are prejudicial or fatal to the health of plants. A particular temperature of the soil is required for germination; one seed will vegetate at 33°, and another requires 80°. A particular heat is requisite to healthy growth; the Almond will expand its flowers at 40°; the Horse-Chesnut demands perhaps 60°: the temperature which is favourable to the growth of one plant is prejudicial to another, and fatal to a third. At 40° the Cabbage thrives, the Kidney Beans and Cucumbers languish, and the Sugar Cane dies."* We have to accept these conditions of the life of the plants we cultivate as absolute and ultimate truths without explanation and without remedy. But although we cannot alter the character of a plant, we can to some extent alter the circumstances under which we cultivate it. "It is a great mistake," as Dr. Lindley states, "to suppose that plants are affected only by the temperature of the air; they are perhaps more affected by that of the soil in which their roots are placed: and there can be no doubt that crops can bear with less inconvenience a warm soil and a cold air, than a cold soil and a warm air." It is at this point, then, that, so far as fertility depends on climate, the power of the cultivator is apparent. "With ordinary field crops a difference of a few degrees of the temperature of the soil causes a most material difference in the healthiness of vegetation or the fitness of the land for the cultivation of a given species. According to the experiments of Mr. Ferguson the mean temperature of the soil near Edinburgh may be taken to be 52° during the summer months. But if it were to fall to 47° it is doubtful whether Wheat would ripen well, or at all." As regards, then, this important agent—temperature of soil—our power of influencing it chiefly depends on drainage. The warm showers of spring in well drained soils at once penetrate and raise the temperature of the mass, and seeds and shoots spring up with vigour. That is one way in which drainage operates at the most important season of the year. Its main influence, however, depends on the diminished evaporation thus permitted from the surface of the land, for the quantity of water which escapes by drainage from a field is much larger than the quantity which runs off the surface of an undrained field of similar size adjoining it; and the difference between either and the rainfall is, of course, evaporated. The one is a vessel open below, the other will hold water, and both being exposed to rain and showers, with intervals of fair weather, it is plain that *all* that falls upon the latter must escape by evaporation, except such portions as run over the edge when the vessel is full; and this evaporation reduces temperature. In his paper on the Fens of Lincolnshire Mr. Clarke says—"So great is the amount of heat stolen from the soil in the process of evaporation that it has been estimated every gallon of water prevented from evaporating by being drained away, adds as much to the temperature of the soil as six gallons of boiling water poured into it." The correcter way of putting it would have been to say that every gallon so evaporated abstracts as much heat as would need so much boiling water to replace it. "Evaporation removes from this district on an average throughout the year about 45 gallons per acre in an hour, which, however, is reduced to 18 gallons in the wet months; if, therefore, water is allowed to lie on a fen three days longer than it could do, there are 1296 gallons more per acre evaporated than there would otherwise be, and an amount of heat lost from the soil equal to that contained in 144 hogsheads of boiling water." But the greater coldness of wet soils and the advantage in point of temperature which is gained by ensuring the passage of air-warm water *through* the soil are referred to in great detail in Mr. Parkes' well-known paper in the fifth volume of the Journal, and we will not dwell further on them. It must be understood as one ascertained cause of the greater fertility of a drained soil, that its higher temperature has a most material influence on the abundance and early maturity of its produce.

Leaving then, the adaptation of the soil as regards temperature to the constitution of the plants we cultivate, we come to its powers as a laboratory, store-room, and machine for feeding plants. Perhaps even yet another exception must be made before we can discuss this purely manufacturing treatment of the subject; for independently of the power of soil to feed the plant, the relations of the former to the latter when they are adapted to one another may, to a certain extent, be asserted, just as its climatic conditions are, as a mere ultimate fact, originating in the habit, constitution, life, of the plant itself, and so remaining without explanation. Thus Wheat and Beans affect a stiff soil, and Barley a light one; Cabbage and Mangold Wurzel affect adhesive loams, and the common Turnip a sandy soil, apart, to some extent, from the powers of these soils to supply their natural growth. This is, we believe, to a certain extent, the case, but less so than is generally imagined. The case of Italian Rye-grass may be taken as an illustration. The two farms in this country where it has been grown most successfully are Willesdon, near London, and Cunning Park, near Ayr—the one a stiff and heavy clay, the other a light and almost blowing sand. The former is the natural soil of the plant, but the natural deficiencies of the latter have been more than made up by the abundant artificial supplies provided through it.

Leaving then this reference to those requirements of a plant which, as they have not been explained, must be taken simply as natural distinctions inherent in its original character, we now come to the soil considered as the food supply of vegetation: and its power to administer this food must be first referred to. This is effected mainly by the passage of water through it. Plants are unable to range at will in search of food: they must have it brought to them, and fertility depends upon the certainty and facility with which this work is done. It is not enough that the food is in the land, it must be placed in solution before the rootlet before it is of any use to the plant; and so (1) the water drill is coming into use—and (2) liquid manuring, as carried on in Ayrshire, and at Tiptree and elsewhere, is found to increase so wonderfully the growth of Rye-grass, and (3) irrigation similarly is so productive of early and abundant growths of meadow grass, and (4) Mr. Wilkins finds his plan of liquid manuring underground at enormous and indeed absurd expense tends to such extraordinary fertility, and (5) land drainage is everywhere so useful. For this is one chief source of the fertilising influence of drainage. The powers of the soil to administer the food it has within it, or which is given to it, are thus increased. Rain-water, valuable in itself as containing food for plants, and valuable as a solvent for its ability to reduce the solid particles of food existing in the earth, so that they can find their way into the plant, is thus enabled to pass through the soil and by the roots of plants, which absorb it as it passes them. Some portion of those differences in fertility, attributable generally to differences in the mineral structure of soils, is no doubt owing to their varying powers in the mere administration of food to plants, and apart altogether from their wealth as store-rooms of that food; and so clay soils are especially improvable by drainage. Drainage is in fact the key by which access is made easy to the food for plants which soils contain.

We come, therefore, now to consider a fertile soil as a well filled store-room of food for plants. It is here that chemical analysis has thrown so much light upon our subject, and to some of its results we shall now refer. It is well in the first place, however, to determine the limits within which this source of information may be trusted. Its affirmative assertions are more likely to be true than its negative assertions. If after long experience the analyst asserts that any substance *is* an essential element of a fertile soil, he is more likely to be correct than if he should venture to declare that some other substance is *not* essential to fertility—for his means of seeing and of judging, keen as they doubtless are, yet have their limits. He can indeed determine the presence of a mere "trace" of any substance present in the glass before him, but a "trace" in the quantity that he deals with is many cwts. per acre in the field; and it may be considered pretty certain that the chemist cannot determine quantitatively the presence of any substance in a soil of ordinary depth nearer than within a cart-load per acre.

* Dr. Lindley in the "Cyclopedia of Agriculture."

There is a power more capable of detecting the presence, whether of food or poison in a soil, than any power the chemist wields—this power is vegetable life. The living plant will make use of fertilising agents though present in quantity so small that the chemist cannot measure it; and the composition of plants, the many analyses that have been published of them, are thus to be considered better indices to what a fertile soil must have within it than is furnished by the direct chemical examination of the soil itself. Last spring Dr. DAUBENY delivered a lecture at Oxford in which a striking illustration of this point was given. His subject was the presence of phosphoric acid in certain of the older rocks; and this, though inappreciable by the ordinary chemical tests, had been made evident by the growth of Barley in artificial soils prepared from the rocks in question. The subsequent analysis of the Barley plants proved the presence of more phosphoric acid than had existed in the seed; and there is this curious agricultural interest incidentally attaching to the experiment, that from the extremely small quantity of phosphoric acid present in the older rocks, as compared with those of more recent formation, the inference drawn "would seem to be, that we had approached the border at least of the lower limit of organic existence"—the stunted, dwindled, puny stems of the half grown Barley, barely vegetating in the artificial soils manufactured from these ancient rocks, proving to the philosopher that the scantiest animal existence alone could there have been, just as a puny crop of grain upon infertile soil proves to the farmer that but little stock is kept upon that land.

EXPERIMENTS ON THE COMPARATIVE FATTENING QUALITIES OF DIFFERENT BREEDS OF SHEEP.

UPON the whole, the general results of this comparative trial between the Leicesters and their cross with the Southdown are:—That the cross-breds consumed slightly more food, in relation to a given weight of animal, within a given time, than the Leicesters. That the Leicesters and cross-bred wethers consumed all but identical amounts of food to produce a given amount of increase, and the cross-bred ewes rather less than either. That the cross-breds yielded slightly the most increase upon a given weight of animal within a given time. That the Leicesters gave rather more wool, both per head and per cent. upon their weight, and the cross-bred ewes more than the wethers. That the fat Leicesters averaged only about 4 lbs. more weight per carcass than the cross-breds. That the cross-breds gave, within a given time, slightly the highest per centage of dead weight to live weight; rather the most loose or inside fat (especially the ewes), and slightly the highest price per stone of mutton. And, finally, when sold dead, the Leicesters—and when sold alive the mixed cross-bred—gave slightly the highest average price per head.

With the above observations we conclude the comparison between the Leicesters and cross-breds alone, as rapid fatteners on a liberal system of feeding and management; and in the usual "Tabulated Summary" of the results which next follows (Table XIX.), we include those of the Hampshire and Sussex Downs and Cotswolds. Henceforth, therefore, the whole six lots of sheep will be compared together.

Taking the items of comparative interest somewhat in the order in which they stand in this Tabulated Summary, it is seen that of the six lots that have been experimented upon, the Cotswolds give by far the largest average weekly increase per head; indeed, about half as much more than either the Sussex, Leicester, or cross-bred sheep, and nearly one-fourth more than the Hampshires, which are the second in order of rate of increase per head per week.

The increase per 100 lbs. live weight per week, as given in the last line of the first or upper division of the Summary Table, does not show by any means such a variation in the rate of increase among the six lots, when it is thus calculated in relation to their respective weights instead of per head. Still, even in this respect, the Cotswolds stand the first; next come the cross-breds; then the Hampshires and Leicesters; and lastly the Sussex Downs. The rate of increase thus calculated in relation to the average weight of the animal is for the Cotswolds one-tenth more than for the cross-breds, and from one-seventh to one-sixth more than for the Hampshires, Leicesters, and Sussex Downs. It is here worthy of observation, that, excluding the Leicesters, the order in which the different lots gave increase in relation to their weight is obviously pretty nearly the inverse of that of the quality of the mutton. That is to say, those which have given the greatest increase in proportion to their weight yield the coarsest mutton, and those which gave the least increase in relation to their weight the finest mutton. Consistently with this view, the Leicesters, however, fall somewhat short in the rate of their increase considering the somewhat inferior quality of their mutton compared with that of the cross-bred and Hampshire sheep.

In the second main division of the Summary Table we have the various particulars of the consumption of food by the different lots of sheep. Leaving the point of the amounts of food consumed per head, the variations in which, so far as the dry foods are concerned, depend on the varying original weights of the different lots; and looking only to the amounts consumed per 100 lbs. live weight of animal, or to produce 100 lbs. of increase, we see that, although the oilcake and Clover chaff were in each case given in proportion to the original weights of the sheep, yet the result was that, taking the average throughout the entire period of the experiment, the Leicesters had less of these dry foods in relation of their average weight than any of the other lots, and more particularly than the Hampshires, Sussex Downs, and Cotswolds. Notwithstanding this, however, the Leicesters also ate less in relation to their average weight of the Turnips, which they were allowed *ad libitum*, than any of the other breeds. This less consumption of total food in relation to their weight by the Leicesters might be in their favour, if the result were that they consumed also less for the production of a given amount of increase. But the fact is seen to be that, in relation to the increase they yielded, the Leicesters consumed quite as much food as the cross-breds, and notably more than the Cotswolds. Leicesters, cross-breds, and Cotswolds, however, all give a larger amount of gross increase for a given amount of food consumed than either the Hampshires or the Sussex sheep. Such are the results of the experiments as they stand on the point of the amount of food required to yield a given amount of increase. But we must not forget that the trials were not all made side by side and in the same season; those with the Hampshire and Sussex Downs being made together in 1850-1, those of the Cotswolds alone in 1851-2, and those with the Leicesters and cross-breds in 1852-3. And although the quality of the respective foods was in all cases as nearly alike as circumstances would allow, yet the actual stocks used were different for the three seasons. There is, nevertheless, much of consistency in the general character and direction of the actual numerical results; which are, indeed, much what we should expect, considering the generally admitted distinctions between the different breeds, though perhaps not on all points what is currently stated of them.

With respect to the wool, it is seen that the long-woolled Cotswolds and Leicesters gave the greatest weight, both per head and per 100 lbs. live weight of animal; next in order come the cross-breds; and lastly, the Hampshire and Sussex Downs. The order of highest amount of wool per head is:—

Cotswolds	Cross-bred wethers
Leicesters	Hampshires
Cross-bred ewes	Sussex Downs.

The order of highest amount of wool per 100 lbs. live weight is:—

Leicesters	Cross-bred wethers
Cotswolds	Sussex Downs
Cross-bred ewes	Hampshires.

It is worthy of notice, that of the cross-breds which were fed in the same season and side by side with the Leicesters, the ewes gave considerably more wool both per head and per 100 lbs. live weight than the wethers; the female offspring, therefore, inheriting more prominently the qualities of the male parent so far as the fleece is concerned. Comparing together the Hampshires and the Sussex Downs, which were fed side by side with each other, the Hampshires gave an average of 1¼ lb. more wool per head; but the Sussex, on the other hand, gave nearly one-fourth more than the Hampshires per 100 lbs. live weight of animal.

Looking to the question of the quantity of mutton or weight of carcase yielded by the different breeds thus fed only to the age of about 15 or 16 months, it is seen that the Hampshires and Cotswolds averaged nearly 12½ stones (8 lbs. per stone) of marketable meat or dead weight, equal to 24 or 25 lbs. per quarter; these Cotswolds were, however, six weeks less time on fattening food than the Hampshires, and were nevertheless somewhat too fat. The Sussex Downs and Leicesters gave only about three-fourths as much dead weight per head as the Hampshires and Cotswolds; that is, little more

TABLE XIX.—GENERAL SUMMARY OF EXPERIMENTS WITH HAMPSHIRE AND SUSSEX DOWNS, COTSWOLDS, LEICESTERS, CROSS-BRED WETHERS, AND CROSS-BRED EWES.

PARTICULARS.	40 Hants. Nov. 1850, to May 1851, 26 weeks.	40 Sussex. Nov. 1850, to May 1851, 26 weeks.	46 Cotswolds. Dec. 1851, to April 1852, 20 weeks.	40 Leicesters. * In the case of the Cotswolds, all the averages in this table are calculated from the results of the five of largest, the five of smallest, and the 10 of medium increase—in all 20 killed, instead of only 16 killed, as in the case of all the other breeds.

than 9¼ stones each, equal to about 19 lbs. per qr.; the long-woolled Leicester, again, giving an equal weight of mutton with the short-woolled Sussex after six weeks' shorter time on fattening food, though probably, it is true, not in point of fact six weeks younger, owing to their earlier date of lambing. Of the cross-breds, the wethers gave about 9, and the ewes about 8½ stones of meat per head—equal respectively to about 18 and 17 lbs. per quarter.

The Hampshires, therefore, after an equal length of time on fattening food, were brought to about one-third more carcase-weight per head than the Sussex sheep. The Cotswolds, with six weeks less on fattening food than either the Hampshire or Sussex sheep, gave an equal carcase-weight with the former and one-third more than the latter. And again the Cotswolds, with an equal length of time on fattening food, gave about one-third more carcase-weight than the Leicesters, and nearly one-half more than the cross-breds. *From the Journal of the Royal Agricultural Society of England.*

A SKETCH OF PIPE IRRIGATION IN SCOTLAND, June, 1855.

(*Concluded from p. 587*).

On the 26th of May we visited the celebrated farm of Myre Mill, in Ayrshire, belonging to one Mr. Kennedy, and occupied by another gentleman of the same name. We took the first train from Glasgow to Ayr, and then proceeded about 9 miles through a pleasant and well cultivated country. We did not find Mr. James Kennedy at home, but were shown over the buildings by a very intelligent man. The farm consists of about 230 acres, all laid with iron pipes; but Mr. Kennedy has two other farms near at hand, making altogether about 700 acres which he occupies. There are about 60 acres under Italian Rye-grass. In 1854 27 tons weight were cut at the first cutting. It was cut four times, and then pastured: 600 sheep and 230 beasts are kept on this food in summer. The sheep are changed three times in the course of the year, or rather there are three lifts or sales. The sheep-house was the most remarkable feature here. It contained 460 sheep in pens, with sparred floors raised 18 inches from the ground, 10½ feet by 7; width of house 18 feet, one side opening at pleasure with sliding wooden rails; a feeding passage of 4 feet wide down the centre. There are 10 sheep in a pen. The man who had charge of the sheep said that he thought a better width for the house would be 16 feet, so as to give more front for the pens to the feeding trough, by making them 12 feet by 6 feet. The black-faced Highland wethers seemed to thrive best, we were informed.

It is worthy of notice that Mr. Kennedy gives his sheep distillery grains, and goes to some expense to obtain them. They are brought all the way from Campbelltown, in Argyleshire, by steamer, to Ayr, where the cost is 3½*d.* per bushel; from thence they are carted 9 miles, with a toll to pay of 6*d.* per cart. Sheep like them best when old and fermented. There are four tanks for liquid manure, holding 30,000 gallons. The ammoniacal liquor from the gas-works mixed with water is sometimes applied, the liquid being brought in barrels. The Italian Rye-grass seemed to have suffered from the late severe winter. It was thin on the ground, with a considerable amount of weeds or natural herbage, and not more than 8 or 9 inches high on the 26th of May. The spring sown Grass was coming up, but foul with weeds, thin, and not regular. The cattle-house is 33 feet wide for two rows of cattle, two feeding passages 4 feet 6 inches wide next to the walls; double stalls 6 feet wide; stone divisions 4 feet high, length of the stalls 7 feet 6, including stone feeding-troughs. Heel drain 2 feet wide, manure-passage in centre, 5 feet between the heel drains. A single rail along the top of the feeding passage, side open from thence down to stone feeding troughs. Floor of stalls tile, no wooden floor; rails and bedding as usual. There were many cattle besides in boxes, two in each. The pigs were given up, and the houses about to be turned into sheepsheds.

On the 25th of May we visited the farm of Lagg, about six miles from Ayr, on the property of the Marquis of Ailsa, and in the occupation of Mr. Ralston. This farm is situated at a very high elevation, and the application of the liquid manure is done on the most economical plan. The liquid from the farm buildings is conducted by means of earthen pipes into three small circular open tanks, and from them flows down by gravitation upon about 40 acres of land at a much lower level. Besides the liquid, artificial manures are sometimes applied. We were shown one field of 10 acres, where Peruvian guano and sulphate of ammonia had been used on different portions, but in equal quantities. The latter had produced the more marked effect. The Italian Rye-grass had been mixed with Clover, and sown with a Wheat crop the year previous. The two years' old Italian Rye-grass had been all destroyed by the severe winter, and the ground ploughed up. There were two cattle houses for 30 beasts each, but no attention paid to appearances alone. The cattle were in single rows, with a feeding passage at their heads, at one end of which was the boiling-house and an iron railway from it along the passage. There can be little doubt that the application of liquid manure, as carried out on this farm, must be remunerative from its economical application.

On the 25th of May we also paid a visit to Canning Park, the well-known farm of Mr. Telfer, and we derived more gratification from this visit than from any other on our tour, from the fact of forming the acquaintance of the proprietor, whom we found to be not only an exceedingly well-informed and intelligent gentleman, but most politely ready to give the results of his scientific studies, his persevering experiments, and practical experience.

The cow-house here has been so often described that we do not propose to enter minutely into it at present; we can only say this, if the cows are not comfortable here, they can be so nowhere under cover. We found 48 tied up in double stalls, 6 feet 6 inches wide, and 7 feet 6 inches long from the feeding passage to the heel drain. This drain has a perforated iron bottom to drain away the liquid, and there is a neat shovel on wheels, which fits into it exactly, for removing any solid excrement. Each cow has her own stone feeding trough, and the divisions and pavement of the passages are also of dressed stone. Each cow has matting of cocoa-nut fibre the first 3 feet of her stall to kneel on, and the skirting of the walls behind the cows, we observed, was lined 4 feet high with slate. There were sky-lights in the roof with sliding blinds, and double doors and windows made to slide also—glass and wood for winter, and a kind of close net-work of hemp or cocoa-nut fibre for summer. The whole of the arrangements for the dairy were excellent. No pains or expense is spared to produce the best description of butter, and we were not surprised to hear that it was sent regularly to London, where it brings a high price, from its superior quality. The whole of the milk is weighed at each milking, for which purpose there is a weighing machine in the cow byre.

The crops were looking well, notwithstanding the severe winter and spring. Some of the two-year-old Italian Rye-grass had given way entirely, and had to be resown. Mr. Telfer uses the sulphate of ammonia as well as the liquid manure for his Italian Rye-grass with the best effect. His young Wheat crop was the thickest we ever saw upon the ground, and we ventured to observe that if each alternate row was removed there would be quite sufficient plants for a first-rate crop. His answer was the result of his last year's Wheat crop, as follows:—On 4¾ acres of Wheat he averaged 85 bushels per acre, of 60 lbs to the bushel, although four-fifths were lodged six weeks before reaping. The straw weighed 5 tons to the acre, and the seed sown on the whole field was 12 bushels. One acre produced 108 bushels, of 60 lbs. to the bushel.

It would take up too much space and time to enter upon the various subjects, deeply interesting to the agricultural world though they be, which were discussed during an agreeable interview with Mr. Telfer. It is to be hoped that he will himself give the results of his experience and various scientific experiments to the world in the shape of a pamphlet. There is no subject more interesting than the management of a dairy farm, and the remunerative results obtainable from that most valuable of our domestic animals—the cow. We rejoice to see "science combined with practice" brought to bear upon the question, and we hope and expect before long to be in a condition to know what to put into the land and what to take from it again, in order to obtain from the cow the greatest proportion of milk, or butter, or cheese, according as it suits the particular locality of the dairy farmer, and that of the best quality. Mr. Telfer is doing much in the right direction.

The last place we visited was in Fifeshire. Leaving Edinburgh at half-past 6 A.M., we proceeded by the Edinburgh, Perth, and Dundee Railway, crossing the Frith of Forth in a steamer to the King's Kettle Station, which we reached at 9 A.M. After taking breakfast at the small village inn, we walked about a mile and a half to Burn Turk, a farm belonging to Alexander Lawson, Esq. We were not so fortunate as to find him at his farm, but his overseer civilly showed us over the buildings, which are not only very complete but very compact, and as substantial as stone and lime and slates can make them. The farm consists of about 150 acres of arable land, 40 of which are under pipe and hose. There were 65 head of cattle in byre, boxes, and yard. The chief byre, or cattle house, was a lofty and spacious apartment, 60 feet long, by 35 feet 6 inches wide, with a feeding passage down the centre, 5 feet wide, on each side of which was a stone division 4 feet high, with a broad cast-iron ledge or rail on the top, running at the heads of the cattle the whole length of the byre. The cattle stood in double stalls with a 3-inch stone partition between each pair, into which the iron rods were fixed diagonally for the rings of the neck chains to traverse. The stalls were 9 feet long, including the feeding trough, 19 inches. This was divided into three compartments — a large centre one for food, and two small ones in each corner for water. The food was admitted through sliding wooden doors in the stone division, opposite the centre of the troughs, and the water by means of a handle in the feeding passage. All the partitions, floors, and troughs were of dressed stone. Behind the cattle was a passage 4 feet 4 inches wide, and a manure drain 15 inches wide. Under the feeding passage, which was raised 10 inches or more from the manure passage, was an air pipe communicating with the external atmosphere, to open or shut at pleasure, with an iron grating opposite to each stall. At one end of the byre was a large room for Turnips, Grass, &c.; at the other another room for straw, &c., connected with the threshing mill, steam engine of 7-horse power, flour mill, and other machinery, all very complete. The cattle were chiefly crosses between the Angus and short-horn, and looked very clean and healthy; they had plenty of fresh straw under them for bedding. Besides the byre, there were boxes 10 feet by 14 for containing three beasts each. These had wide sparred doors communicating with the dung court, and which moved up and down by means of balance weights. In the dung court were 15 more beasts. This ought to have been covered to make the whole complete. There was an arched tank under it containing 50,000 gallons. The liquid from this was this year carted upon a field where the pipes were not laid; the field was 12 acres, and it took four water carts 1½ days. The crops here had suffered from the winter. The Italian Rye-grass was cutting for the first time, and only 9 or 10 inches long on the 8th of June.

We give these hasty sketches of some of the establishments where the new system of pipe irrigation is carried on in Scotland, in the hope that they may induce others to look into the subject. We have a strong opinion that the system is a good one, but its application is a question of expense, and, to a certain extent, of locality. Where a farm steading is situated in high ground, and the gravitation principle can be used, as at Mr. Ralston's farm of Lagg, in Ayrshire, it will surely pay. Where there exists a steam engine or water power on a farm, we believe it will answer also, provided that in both cases there be an abundant supply of water. When new farm steadings are about to be built, it may be well also to prepare for having a portion of the land at least under pipe irrigation, but we require some more accurate account of profit and loss, before we can say decidedly that establishments such as that of the Marquis of Breadalbane will be remunerative in a pecuniary point of view. We hope that his lordship will favour the public with a balance sheet by and bye.

In the case of Mr. Malcolm's (of Poltalloch) farm of Killinochanoch, the result of the first year's trial was a clear profit of 4*l.* 7*s.* 2¼*d.* per acre, after allowing 35*s.* per acre of rent upon land, part of which a few years before was not worth as many pence. Here it will be observed that water power existing upon the farm was made use of to pump the liquid manure daily up to the reservoir, from whence it descended again as wanted, by gravitation.

We conclude this article with something for our agricultural readers to ruminate on. One ton of Italian Rye-grass is stated from analysis to contain nutritive qualities equal to 4 tons of White Turnip, so that 80 tons of Italian Rye-grass, which under the liquid manure system has been grown by Mr. Telfer, and from our own experience, we believe may be grown by any one, on a single acre, are equal in feeding properties to 320 tons of White Turnip! A pretty fair return for one acre. *J. A. C.*

WHAT IS TO BE CONSIDERED THE STANDARD COMPOSITION OF SUPERPHOSPHATE OF LIME?

In attempting to give a reply to this question it will be necessary for me to give the results of analyses of different kinds of superphosphates; and before doing so, it may be well to explain the way in which the results are stated, particularly as regards the soluble phosphates. I have already mentioned, that in a superphosphate, part of the phosphate of lime is converted into the biphosphate by the action of the sulphuric acid, but in the analyses the quantity of the latter is not given, but the phosphates are divided into two portions, called soluble and insoluble phosphates. The mode in which this is to be understood will be best rendered intelligible by an individual example. Thus, on the first of the subjoined analyses, we find 15.08 per cent. of soluble, and 18.01 of insoluble phosphates; the sum of these, 33.09, expresses the quantity of phosphates existing in the manure previous to the addition of sulphuric acid, and the soluble phosphates are the quantity of common phosphate of lime which is converted into biphosphate by the sulphuric acid. This conversion is effected by the sulphuric acid, of which the proportion is given lower down in the analysis; and the sulphate of lime which also appears, indicates the quantity of lime which has existed as carbonate in the original substance, or which has been deliberately added for the purpose of drying up and giving bulk to the product. It is to be observed, then, that the soluble phosphates actually exist as biphosphate, although not so represented in the analysis; and though it would be more correct, in a scientific point of view, to give the proportion of biphosphate, yet the course I have employed has advantages for practical purposes, as it shows the mode in which the manure has been manufactured. The proportion of sand and of alkaline salts requires no comment.

The first two analyses are examples of superphosphate apparently made entirely from bones, and in which the proportion of soluble phosphates is large. In the one, a small quantity of gypsum, and in the other of alkaline salts, has been added, apparently for the purpose of drying the product.

	I.	II.
Water	10.70	17.50
Organic matter	12.74	15.63
Soluble phosphates...	15.08	13.08
Insoluble phosphates	18.01	24.65
Sulphate of lime	2.22	15.87
Sulphuric acid	18.39	6.23
Alkaline salts	13.06	4.63
Sand	9.80	2.41
	100.00	100.00
Ammonia	2.07	2.35

In both these we have examples of superphosphate of

high quality, containing a large quantity of soluble phosphates, and a fair proportion of ammonia; and the importance of the latter becomes obvious, when we bear in mind that it adds 1*l.* 2*s.* per ton to the value of the first, and 1*l.* 5*s.* 6*d.* to that of the second sample.

The following are illustrations of superphosphates also from bones, but of lower quality than the preceding:

	III.	IV.	V.
Water	13.60	18.26	17.22
Organic matter	24.90	11.95	14.83
Soluble phosphates	8.71	7.06	4.50
Insoluble phosphates	29.14	31.27	31.35
Sulphate of lime	10.76	11.93	18.74
Sulphuric acid	7.49	4.93	4.43
Alkaline salts	1.82	11.18	1.20
Sand	3.58	3.42	7.73
	100.00	100.00	100.00
Ammonia	3.13	3.24	3.25

In these superphosphates the quantity of sulphuric acid employed has been deficient, and hence, though the total quantity of phosphates is as large as in the previous ones, a much smaller proportion is soluble; and as we shall afterwards more particularly point out, the value of the superphosphate is diminished. The quantity of ammonia, however, is large, and forms an item of some importance in estimating their value.

From these we turn to another variety, apparently made from a mixture of bones and coprolites, in which the ammonia little exceeds 1 per cent.; the quantity of phosphates is rather lower, and of sulphate of lime higher than in those from bones alone.

	VI.	VII.	VIII.
Water	17.98	24.33	13.84
Organic matter	17.29	10.60	7.95
Soluble phosphates	21.22	14.38	14.18
Insoluble phosphates	3.41	14.36	7.44
Sulphate of lime	20.82	16.00	21.71
Sulphuric acid	5.19	6 48	19.62
Alkaline salts	6.13	3.98	3.92
Sand	7.96	9.87	11.34
	100.00	100.00	100.00
Ammonia	1.66	1.03	0.93

	IX.	X.	XI.
Water	32.39	16.10	21.04
Organic matter	8.63	10.53	12.42
Soluble phosphates	12.97	10.62	10.16
Insoluble phosphates	16.12	10.48	9.53
Sulphate of lime	18.54	3.92	33.90
Sulphuric acid	6.10	23.89	3.94
Alkaline salts	3.32	19.55	2.46
Sand	1.93	4.81	6.50
	100.00	100.00	100.00
Ammonia	0.79	0.80	1.10

And, finally, we have examples of superphosphates made entirely from coprolites or other mineral phosphates, distinguished by a small proportion of organic matter, and abundance of sulphate of lime. In one only, however, is ammonia entirely absent; the others contain small quantities, though none of them, except the last, in sufficient quantity to be of value.

	XII.	XIII.	XIV.	XV.	XVI.
Water	8.43	18.20	23.77	23.78	14.00
Organic matter	0.00	2.83	3.00	1.70	0.63
Soluble phosphates	15.37	14.04	12.19	10.24	13.90
Insoluble phosphates ...	15.07	6.15	7.77	7.95	23.98
Sulphate of lime	36.03	36.88	36.23	38 56	31.57
Sulphuric acid	11.24	11.51	8.44	4.15	8.24
Alkaline salts	1.60	3.17	0.01	7.56	1.06
Sand	12.26	7.22	8.59	6.06	6.62
	100.00	100.00	100.00	100.00	100.00
Ammonia	0.00	0.56	0.49	0.45	0.60

It would be easy to multiply analyses of the different sorts of superphosphate, but those given are sufficient to show how greatly different samples, all made with the desire of supplying a reasonably good article, vary in composition and value. Yet it is probable that no great difference in price will exist among the greater number of them. Those made entirely from bones, and coming from manufacturers of high standing, are generally dearer; but no commercial distinction is drawn between the others, a fixed market price generally being charged, altogether independently of composition. Yet a moment's inspection suffices to show that the differences in value are exceedingly great.

Some difficulty exists in forming a satisfactory estimate of the value of a superphosphate from its composition, owing to there being no fixed value to attach to the soluble phosphates, except that calculated from the manure itself. But, taking as a starting-point the samples produced from bones, we may arrive at some definite idea in the following manner: I assume ammonia at 6*d.* per lb., or 11*s.* for every per cent., and insoluble phosphates at ¾*d.* per lb., or, in round numbers, 1*s.* 6*d.* for each per cent. Now, such superphosphates as Nos. 1 and 2 are sold at about 8*l.* per ton; and if we calculate the value of the ammonia and insoluble phosphates, and deduct this from 8*l.*, we have the value of the soluble phosphates. Thus we have for Nos. 1 & 2—

	No. 1.	No. 2.
Value of ammonia per ton ...	£1 2 0	£1 17 0
Value of insoluble phosphate ...	1 7 0	1 6 0
	£2 9 0	£3 3 0
Deducting this from 8*l.*, leaves for the value of the soluble phosphates	£5 11 0	£4 17 0

And dividing these sums by 15 and 13, the respective per-centages of soluble phosphates, we find it in both cases to give a value of almost exactly 7*s.* 6*d.* for each per cent. of these substances. The better class of the other superphosphates give a similar, though somewhat higher value for the soluble phosphates, except No. 6, which, if sold at 7*l.*, would give a lower value; but as I do not know its price, we must not allow it to influence the calculation. It is probable that we shall not err greatly by assuming 7*s.* per cent. as the value of soluble phosphates. Now, if we apply this mode of calculation, we see that the values differ excessively. Thus, No. 3 gives—

29 per cent. insoluble phosphates, at 1*s.* 6*d.* per cent.	£2	3	6
8.71 per cent. soluble phosphates, at 7*s.* per cent. ...	3	1	0
3.13 per cent. ammonia, at 11*s.* per cent.	1	14	6
Value per ton	£6	19	0

And in the same manner, No. 5 is worth 5*l.* 13*s.*; No. 7 ought to cost 6*l.* 10*s.*; No. 15, 4*l.* 8*s.*, and so on.

No. 6, calculated upon this principle, shows a higher value than any of the other samples, by virtue of its large proportion of soluble phosphates; its calculation giving—

21 per cent. soluble phosphates at 7*s.* ...	£7	7	0
3 per cent. insoluble phosphates at 1*s.* 6*d.*	0	4	6
1.6 per cent. ammonia, at 11*s.*	0	17	0
Value per ton	£8	8	6

Now, if we take into consideration the preceding calculations, and the composition of the commercial samples of superphosphate, it appears to me that we may assume a standard to which all well manufactured samples should attain. It would appear that a good superphosphate should contain 15 per cent of soluble phosphates, and 15 insoluble; and if made from bones, in addition to these, not less than 2 per cent. of ammonia. A superphosphate made from coprolites, and containing these proportions of phosphates, should be sold for 7*l.*, and from bones at 8*l.* According to my experience, the samples coming from the best manufacturers have about this composition; but the farmer would do well to remember that a large proportion of soluble phosphates adds most materially to the value, as is seen in the analysis No. 6. It is very desirable that this fact should be distinctly brought before the manufacturers, who would find it decidedly to their advantage to aim at producing a manure containing a large proportion of soluble phosphates, which, they would find, repays them better than productng the inferior qualities, particularly if got from coprolites, because a considerable proportion of the acid is consumed in neutralising the carbonate of lime. Thus, suppose a sample of coprolite to contain 20 per cent. of carbonate of lime, and the manufacturer to add to it 30 per cent. of sulphuric acid, 25 of the acid would be consumed in converting the carbonate into sulphate of lime, and only 5 per cent. would remain over to convert the insoluble into soluble phosphates; but if he added 35 per cent. of acid, 10 per cent. would remain, and he would then produce a superphosphate with twice the quantity of soluble phosphates contained in the former.

These observations I have thought it well to bring before the farmer, as I know that large quantities of very inferior superphosphates go into the market. It is not my intention to refer particularly to these articles here; it will suffice to say that many tons, containing 2 or 3 per cent. of soluble phosphates, are yearly disposed of in different parts of Scotland. *Dr. Anderson, in the Transactions of the Highland Society.*

Home Correspondence.

Clod-crusher.—I beg to hand a design for a new clod-crusher for insertion in the *Gardeners' Chronicle and Agricultural Gazette;* the discs are all of the same diameter, work on three centres, and self-cleansing. *Henry Cobby*, 10, *Walker Street, Hull.* [The drawings exhibit an axle with a number of eccentrics upon it placed so that each alternately and in succession shall attain its greatest elevation or depression during the revolution of the axle. On these eccentrics the discs, as in Crosskill's clod-crusher, revolve. The same self-cleansing and irregular motion of the discs is attained by Crosskill by an ordinary axle passing through a larger slot in the disc, so that this irregular motion is permitted, not enforced, as in Mr. Cobby's proposal; but the motion in question, though only permitted, is ensured by the irregular surface of the soil as perfectly as if it were enforced.]

Hardy's Wheat Crop.—Many friends from far and near have seen our experimental Wheat crop, which was sown on the thin principle, in about 10 different plans and distances, on nearly 3 acres of common ploughed land. One and all pronounced it a very good crop. But some will not believe us, that there was so little seed sown on the whole breadth as 1 bushel and 5 pints. This, however, is a fact. Why should they doubt this statement, since, at 20,000 grains in 1 quart, it amounts in round numbers to 670,000 kernels, and supposing the breadth to be exactly 3 acres, viz., 18,817,920 square inches, and all the ground were covered or planted, without any 4 feet furrows and 4 feet spaces between the double rows on the greatest part of the breadth as we have them, then it would allow 28 square inches and a fraction for each grain or plant, equal to about five plants on each square foot (and is this not enough plants or enough space)? Why then should any one doubt our words, our land being not above half planted? The fact is, a very great deal of seed was actually wasted, even on this, and ought not to have been planted on it. One-half acre, however, planted with only 4 pints, and reduced to 3 pints by thinning the plants, which stood in pairs, with 4 feet furrows, far exceeded any of the rest, in the estimation of all who saw it, except the 4-rowed planted entire at 2 feet apart on ½-rod ridges, with 4 feet furrows, at 1 peck to the acre. Also about 4 rods transplanted at 1 foot apart, which will certainly come up equal to 8 quarters per acre, notwithstanding it has partaken of the prevailing blight, and been pecked by birds, even as other. The broad-casted, at 2 pecks the acre, is decidedly the worst crop, as it could not be kept clean. We promise to give full particulars in a future number. *Hardy & Son, Maldon.*

Crops in Ireland.—Wheat, which is now generally cutting, from very many inquiries I can only report middling. The plant was generally thin in the ground, owing to the severe winter; in many places it was broken down before ripe by wind and rain; in some places I find it "malted." Barley will be much under an average in produce, the sample being uneven, owing to a second growth, and being nearly all laid long before fit for the sickle. Oats very variable in different localities, but below an average on the whole; straw plentiful, grain not well filled. Green crops promise near an average, I think, where properly attended to. Potatoes—tops all gone, tubers under size; a large breadth of land sown, in general quality deficient, in many places bad for table, disease in roots increasing. Weather for the last few days very propitious, glass up to nearly set fair. *George Gordon.*

Farm Memoranda.

NEAR STALYBRIDGE.—I must commence by stating that my farm is 20 miles from my works on the Yorkshire side of the moors, and at an elevation of 850 feet above the sea; that I have abandoned milking and feeding as unprofitable, considering the price of labour and farm produce; and with the exception of a few sheep have entirely devoted my land to crops, Turnips, Potatoes, hay, and corn. The whole of my produce is consumed at my works (charged market prices) which will realise on an average for Turnips per ton from 15*s.* and 1*l.*, hay, 4*l.* and 5*l.* per ton, straw, 50*s.* and 3*l.* per ton, Oats and Wheat market prices. With this management I can realise a satisfactory profit, but not so when feeding, although I took the butcher's profit by selling my meat to my workpeople. Now, with respect to manure I have an abundance (being very favourably situated at both ends with stations on the rails, the one at farm is fair in the centre), whether it is human manure, horse manure, or bones. My human manure can be laid down per rail at 5*s.* per ton on my farm. It is conveyed in old large oil casks, which contain 1 ton each, neat out of the privies (disinfected with a little sulphate of iron); my horse manure, including carriage and all expenses, at 8*s.* per ton; and with respect to bones, I have erected a small bone and size works upon my farm, and boil about 6 tons per week, just enough to keep one man going; my size and tallow is sent to Manchester to stiffen fustians with, and make soap of, the boiled bones are then crushed in an old gin mortar mill and passed through a riddle having three squares to the inch. Whatever bones I do not need are readily sold to the farmers about. I dissolve with acid as many as I use, and sell the rest to my neighbours, so that I am in capital condition for manuring land. Now Professor Johnson in his "Lectures on Agricultural Chemistry," p. 8, states that 1 ton of bones is equivalent to 40 tons of ordinary farm manure; if such is a fact, 40 tons at 8*s.* would be 16*l.*, whilst bones would not exceed 6*l.*, the carriage from my place to the farm being the same in each case, viz., 2*s.* 7*d.* per ton, so that bones are by far the cheapest manure. The question that now puzzles me is, shall I be justified in totally abandoning farm yard or vegetable manure, and will my land be deteriorated by relying on bones alone, or is it absolutely necessary that vegetable manure should be used in order o keep up the fertility of the soil?

Notices of Books.

The Village Lesson Book for the Use of Schools. By Martin Doyle. Groombridge & Son.

THIS is a little book of 116 pages, containing 10 square inches each, in which are given lessons on the duties of the bird-keeper, cow-boy, shepherd-boy, and plough-boy, and on land measurement, digging, and field labour. It is very desirable that country children should receive instruction in the occupations in which as men they are to be engaged; and by the use of books in country schools, such as this of Martin Doyle's, they can be thus instructed in the very act of learning to read.

Miscellaneous.

Artificial Formation of Ammonia.—The vapours which escape from iron blast furnaces may be regarded simply as the atmosphere highly charged with carbon, or as a mixture of carbonic oxide, cyanogen, and nitrogen. When steam at a sufficiently high temperature, and air excluded, is mingled with these gases, the oxygen of the steam decomposes the cyanogen, and converts the carbonic oxide into carbonic acid, while the hydrogen and nitrogen combine to form ammonia; thus carbonate of ammonia will result; but as it may prove difficult to condense this effectually, if the vapour of ammonia were conveyed into a chamber charged with an insoluble lumpy material, so arranged that the ammonia in ascending would come in contact with the cold solution of salt trickling down, carbonate of soda and muriate of ammonia might be at once obtained. If, however, an ample supply of sulphate of iron could be procured, it

would be more advisable to fix the ammonia by means of sulphuric acid expelled from sulphate of iron, because at the same time pure oxide of iron would be produced, which would prove valuable in the subsequent forging of iron. Alkali refuse should be composed of sulphuret of calcium and coke dust. When this is acted upon by steam with sufficient heat, the oxygen of the steam converts the calcium into lime, while the sulphur and hydrogen pass off as sulphuretted hydrogen. When the latter is mingled with the vapours from a dense purely carbonaceous fire, consisting of carbonic oxide and nitrogen, the latter combines with the sulphuretted hydrogen, and forms sulphuret of ammonia. If these vapours are then partially cooled down and a large quantity of cold air admitted, the carbonic oxide becoming carbonic acid combines with the ammonia, and disengages sulphur; thus carbonate of ammonia and sublimed sulphur might be obtained. If, on the other hand, the heat of the vapours is maintained, and a large quantity of heated air thrown in, the sulphuret of ammonia is converted into sulphite, which rapidly passes into sulphate of ammonia; by means of which more salt may be decomposed, and thus alkalia refuse may be brought to yield sulphate of soda, muriate of ammonia, and carbonised lime dust. This latter material will be valuable in agriculture; it should be worked into the land when preparing it for seed, muriate of ammonia being afterwards applied to the growing crop, when the first shower of rain will carry it into the soil, when carbonate of ammonia will be disengaged in direct contact with the root of the plant. By treating gypsum as sulphate of lime, with small coal and high heat in a reverbatory furnace, it would be reduced to sulphuret or calcium, and may, by a similar mode of treatment, yield the same products as alkali refuse. *Mining Journal.*

Calendar of Operations.

AUGUST AND SEPTEMBER.

Gloucestershire, *August.*—There is a much greater growth of Wheat this year than last, and with the prospect of pretty tolerable crops. The plant, however, is thin both in the hill and vale districts; in the former, however, the average will be made up by generally well formed ears, all of which is in a tolerably healthy condition; here, too, on account of the usual shortness of straw and thinness, the heavy pelting rains have caused little injury by laying. In the Vale the heavier crops are much laid, but as it is progressing fast to ripeness, fine weather will ensure an average harvest. With us, Barley may be considered quite a Barley year; the prospects of the crops are exceedingly good, and the late rains have caused the seeds sown with the crop to assume a more healthy appearance than those of last year. Oats are promising well, and I think a greater extent is sown than I remember to have seen formerly. Winter-sown Beans suffered much from the long frosts, but have wonderfully recovered in the last few weeks. Spring-sown promise best this year; in both cases they are with us tolerably free from blight. The prospect of the Turnip crop is somewhat serious, as many of the early sown were so taken with the Turnip flea as to compel re-sowing sometimes for the third time, and now they are so smothered with the weeds which the late rains have accelerated in growth, without allowing time for their removal, that weed sowing farmers will suffer greatly here; and there will be seen a fair prospect of a crop of Swedes, but it is a rare exception, but the Turnip has suffered most, and the greater part of them will be exceedingly late, as few crops have escaped the necessity of re-sowing at least once. The Potato crop promises at present exceedingly well; the yield of the early sorts has been very abundant, neither deficient in size or quantity; in these are few signs of the disease of former years, still the haulm has not been unscathed, though the tubers as yet do not seem to have suffered. As respects the later sorts we can at present say little, for though they looked well everywhere, yet the rains which have brought a cold night or two seems to have told upon the tops; however, should much of the crop be doomed to suffer (and we incline to think the virulence of this disease is wearing out), there will not be the scarcity of former years, as far more of this plant is grown this year than for three or four years last past. Hay is by no means an abundant crop, and though the greater part has been tolerably well harvested, yet still enough remains undone to make farmers regret that they did not "get among it earlier," for which neglect the excuse pleaded is the scantness until the rains caused it to grow; however this is at best but bad economy, as if the farmer will wait for the springing up of fresh herbage while the seed is ripening, it is sure to be at the expense of the latter-math, and frequently the crop of the season, and must necessarily weaken the prospects for the forthcoming year; it being a fact, with most herbaceous plants, that the allowing them to seed is the termination of their lease of life.

Hexham, *Sept* 3.—The weather during the month that has just closed has been a decided improvement upon what we experienced during the previous months. We had some heavy rains in the early part of the month, which completely flattened any strong corn which had withstood the rains of July. Though a few fields were cut during the week ending the 25th ult., harvest was not general till last week, when a considerable breadth of grain was cut, and should the weather continue fine (which, however, a falling barometer and north-east wind do not indicate), there will be a good deal carried this week. Crops are not cutting up so well as was at one time expected, and both in yield and in quality will be deficient. Turnips continue to look well, and we have as yet seen no appearance of the Potato blight, and as the earlier varieties are now approaching maturity, we hope this district has escaped for this year.

Notices to Correspondents.

Compost: *R H.* Slake 20 bushels of lime with brine and mix it with 10 cart-loads of the pond cleanings; it will be a good dressing for an acre of land.

Food for Pigs: *R H.* As a general rule cooked food is more digestible and fattening. The meal had better be boiled; the same quantity of meal in its porridge state will be more nourishing.

Lodged Grain: *R H.* You had better sow short-strawed Wheats.

The Gapes: *A Farmer's Wife* must take the bird on its back in her left hand, holding the beak open with the fingers of that hand, and with the right holding the end of a small quill feather, properly trimmed and dipped in sweet oil, she must, watching her opportunity, slowly insert the feather end 2 inches into the windpipe of the unfortunate bird, and turn it once round and withdraw it. The bird will cough up the worms which occasion the disease.

Tiney's Success: *To several Correspondents.* We presume application should be made to General Arbuthnot.

*** As usual, many communications have been received too late, and others are unavoidably detained till the necessary inquiries can be made.

OAT-CRUSHING AND BEAN-SPLITTING MILL (Turner's No. 5).

This Mill is recommended to the use of every person keeping a Horse, as superior for efficiency, durability, and ease in working to any manufactured. Two bshls. of crushed corn afford more nourishment both to old and young horses than three bushels of uncrushed!

Price £5 15*s.* 6*d.*

Made and Sold by E. R. & F. TURNER, St. Peter's Iron Works, Ipswich.

REAPING MACHINE.

WILLIAM DRAY AND CO.'S Book of Testimonials from purchasers of their Patent Reaping Machines, also a List of Prizes, and full description will be forwarded, post free, on application to

Wm. Dray & Co., Swan Lane, Upper Thames Street, London.

SCYTHES.—Boyd's Patent Self-Adjusting Scythes may be had of the Manufacturers, William Dray & Co., Swan Lane, London, and of all Ironmongers and Seedsmen.

A liberal allowance to the trade.

ROYAL AGRICULTURAL SOCIETY OF ENGLAND.
MEETING AT CARLISLE, JULY, 1855.
First Prize Awarded to

RICHMOND AND CHANDLER'S No. 3 B CHAFF MACHINE, Price £7.

All the various modern Implements of Agriculture manufactured on the most scientific and improved principles, suitable for home use and exportation.—Address, Richmond & Chandler, Salford, Manchester; and 32, South John Street, Liverpool.

☞ Catalogues Gratis.

PARKES' STEEL DIGGING FORKS & DRAINING TOOLS.

MESSRS. BURGESS AND KEY, as Mr. Parkes' Wholesale Agents for England, have always in stock a large assortment. These Forks and Tools are now in use by upwards of 1000 of the Nobility and Farmers, members of the Royal Agricultural Society, who pronounce them to be the best ever invented, and to facilitate labour at least 20 per cent. Price Lists sent free on application, and Illustrated Catalogue of the best Farm Implements, on receipt of eight postage stamps.

103, Newgate Street, London.

THE HYDRAULIC RAM will raise water, without manual labour, to any height, where a small fall can be obtained.

PARSEY'S PATENT REVOLVING PUMP lifts three times the quantity of water with the same labour, than any other Pump.

Fire, Garden, Deep Well, Liquid Manure, and all other Pumps.

Fountains of every description erected; Rockwork, Grottoes, &c.

Hose Pipe of every kind for watering Gardens.

W. F. Roe (late Freeman Roe), Hydraulic Engineer, 70, Strand, London.

COTTAM AND HALLEN have on Show, at their Repository, No. 2, Winsley Street, Oxford Street, London, a great variety of the following articles for the Garden, &c., at very low prices, viz.:—Garden Rollers, Cast-Iron Rickstands, Garden Engines, Mowing Machines, Garden Chairs, Superior Garden Tools of all kinds, Garden Vases and Pedestals in great variety, and a large assortment of Horticultural and Agricultural Implements.

Ornamental Wire Flower Stands, Pot Trainers, Rose Tree Guards, Flower Bordering, and every description of Wire Work, both plain and ornamental.

Hand Glass Frames, Cast and Wrought Iron Flower Stakes, Garden Arches, &c.

Strong Iron Hurdles, and best Wire for Strained Wire Fencing.

Hothouses, Conservatories, &c., made upon the most improved principle, either of Iron, or of Iron and Wood combined, which can be fixed complete, with Hot Water Apparatus, in any part of the Kingdom. Show Rooms at the Manufactory, 2, Winsley Street, Oxford Street, opposite the Pantheon, where every information may be obtained.

212° MILNER'S HOLDFAST AND FIRE-RESISTING SAFES (non-conducting and vapourising), with all the improvements, under their Quadruple Patents of 1840-51-54 and 1855, including their Gunpowder Proof Solid Lock and Door (without which no Safe is secure), the strongest, best, and cheapest safeguards extant.

Milner's Phœnix (212°) Safe Works, Liverpool, the most complete and extensive in the world. Show Rooms, 6 and 8, Lord Street, Liverpool. London Depôt, 47A, Moorgate Street, City.

Circulars free by post.

NO CHARGE FOR STAMPING at LOCKWOOD'S, 75, New Bond Street. Good cream-laid Note-paper, five quires for 9*d.*; Thick ditto, five quires, 1*s.*; Albert and Queen's sizes, five quires for 6*d.*, 9*d.*, and 1*s.*; Note-paper made from Straw, 2*s.* 6*d.* per ream; Envelopes, 4*d.* to 1*s.* 6*d.* per hundred; Foolscap paper, 7*s.* 6*d.* per ream; Copybooks 2*s.* 6*d.* per dozen. Card Plate engraved, 2*s.* 6*d.*; 100 Cards printed, 2*s.* 6*d.* Wedding orders promptly executed. A large variety of Writing and Dressing Cases, Envelope Boxes, Blotting Books, Inkstands.—Copy address, Lockwood's, 75, New Bond Street. Country orders for 20*s.* sent carriage free. Lockwood's celebrated Nugget (Gilt) Pen, 1 doz. post free for 13 stamps.

METCALFE AND CO.'S NEW PATTERN TOOTH BRUSH, PENETRATING HAIR BRUSHES, AND SMYRNA SPONGES.—The Tooth Brush performs the highly-important office of searching thoroughly into the divisions and cleansing in the most extraordinary manner—hairs never come loose. Peculiarly penetrating Hair Brushes, with durable unbleached Russian bristles, which will not soften like common hair, and immense stock of genuine unbleached Smyrna Sponge, with every description of British and Foreign Perfumery, at Metcalfe, Bingley, & Co.'s only Establishment, 130 B and 131, Oxford Street, second and third doors west from Holles Street.

Caution.—Beware of the word "from" Metcalfe's, adopted by some houses. Metcalfe's Alkaline Tooth Powder, 2*s.* per box.

TOURISTS, TRAVELLERS, AND OTHERS,
Exposed to the Scorching Rays of the Sun, and Heated Particles of Dust, will find

ROWLAND'S KALYDOR a most refreshing preparation for the Complexion, dispelling the cloud of languor and relaxation, allaying all heat and irritability, and immediately affording the pleasing sensation attending restored elasticity and healthful state of the skin. Freckles, Tan, Spots, Pimples, Flushes, and Discoloration fly before its application, and give place to delicate clearness, with the glow of beauty and of bloom. In cases of sunburn or stings of insects, its virtues have long been acknowledged. Price 4*s.* 6*d.* and 8*s.* 6*d.* per bottle.

ROWLAND'S MACASSAR OIL, a delightfully fragrant and transparent preparation, and as an invigorator and purifier beyond all precedent.

ROWLAND'S ODONTO, or PEARL DENTIFRICE, a White Powder, compounded of the rarest and most fragrant exotics. It bestows on the teeth a pearl-like whiteness, frees them from Tartar, and imparts to the Gums a healthy firmness, and to the breath a grateful sweetness and purity.

Sold by A. Rowland & Sons, 20, Hatton Garden, London; and by Chemists and Perfumers.

DO YOU WANT LUXURIANT HAIR, WHISKERS, &c.?—The most marvellous production of modern date is ROSALIE COUPELLE'S CRINUTRIAR, which is guaranteed to produce Whiskers, Moustachios, Eyebrows, &c., in a few weeks, and restore the Hair in baldness from whatever cause, strengthen it when weak, prevent its falling off, and effectually checks greyness in all its stages. For the nursery it is recommended by upwards of 100 physicians, for promoting a fine healthy head of hair, and averting baldness in after years. Sold by all Chemists and Perfumers, price 2*s.*, or will be sent post free on receipt of 24 penny stamps, by Miss Coupelle, 69, Castle Street, Newman Street, Oxford Street, London. Mrs. Carter writes, "My head, which was bald, is now covered with new hair." Mrs. Williams—"I can show a fine head of hair from using your Crinutriar." Mrs. Reeve—"My hair is gaining strength and thickness." Sergeant Craven——"Through using it I have an excellent Moustache." Mr. Yates—"The young man has now a good pair of whiskers. I want two packets for other customers."

CURE OF CONSUMPTIVE COUGH, by Dr. Locock's Pulmonic Wafers.—From the author of the "Narrative of the Second Sikh War."—"I had long suffered from a deep-seated cough when Providence placed in my way a box of your Pulmonic Wafers. I experienced instantaneous relief, and have such a high estimate of their efficacy, that I firmly believe they would effect the cure of the most consumptive person. You may make any use you please of this letter.—Edward Joseph Thackwell, Lieut. 3d Light Dragoons, Union Club, London." They have a pleasant taste. Price 1*s.* 1½*d.*, 2*s.* 9*d.*, and 11*s.* per box. Sold by all Druggists.

This day is published, PART VII., in handsome Folio, of the

FERNS OF GREAT BRITAIN

NATURE-PRINTED (LIFE SIZE).

Parts I. to VI. of this splendid Work are still on sale, price 6*s.* each.

MORTON'S NEW FARMER'S ALMANAC.

Early in November will be Published,

A NEW FARMER'S ALMANAC. Price 1*s.* By JOHN C. MORTON, Editor of the "Agricultural Gazette," the "Cyclopedia of Agriculture," &c.

Along with the usual contents of an Almanac, it will include:—1. Monthly directions for the operations of the Farm and Garden. 2. Short notices of the past year's Agricultural novelties and progress. 3. Such an Index to current Agricultural Literature as will direct the student to sources of information on the principal Agricultural topics. 4. A list of the more important of those well-established facts in Farm experience, which may serve as trustworthy data in Agricultural Estimates and Calculations. 5. Short references to the treatment proper under the more common Diseases to which Farm Stock are liable. 6. A series of Instructions and Receipts in many particulars of Household, Garden, Field, and Dairy Management. 7. A guide to the more important of our Fairs and Markets, with information as to times and places where the different kinds and breeds of Stock may be best obtained. 8. An index to the Meetings, Office-bearers, and objects of our principal Agricultural Societies and Farmers' Clubs.

The object throughout will be, by good arrangement and close packing, to furnish as much Agricultural information of practical usefulness as can be issued by the printer and the publisher for 1*s.*

London: BLACKIE & SON, Warwick Square; and Glasgow and Edinburgh.

Now ready,

THE FERNS OF GREAT BRITAIN: Illustrated by JOHN E. SOWERBY. The Descriptions, Synonyms, &c., by Charles Johnson, Esq. In One Vol. cloth boards, containing 49 Plates, full coloured, 27*s.*; partly coloured, 14*s.*

JOHN E. SOWERBY, 3, Mead Place, Lambeth.

TO ADVERTISERS.

THE SOUTH-EASTERN GAZETTE, a Family, Commercial, and Agricultural Newspaper, which has a circulation exceeding 3300 copies weekly, has been at the head of the Kentish Press for 20 years, for the past five years has had double the circulation, and, as shown by the official stamp returns to July 1, 1855, has now three times the circulation of the next highest, and nearly five times that of any other Newspaper in Kent. It has a larger circulation than the whole of the papers published in East Kent together, and also than the whole of those published in West Kent.—Published every Tuesday, price 5*d.*, stamped, 4*d.* unstamped, at the Offices, 27, Week Street, Maidstone, and 21, High Street, Canterbury.—Maidstone, Sept. 8.

TO NERVOUS SUFFERERS.

A RETIRED CLERGYMAN having been restored to health in a few days, after many years of great nervous suffering, is anxious to communicate to others the means of cure; he will therefore send (free), on receiving a stamped envelope, properly addressed, a copy of the prescription used.—Direct Rev. E. DOUGLASS, 18, Holland Street, Brixton, London.

FOR THE BENEFIT OF SUFFERING HUMANITY.—A retired gentleman having cured himself of Deafness, Defect of Sight, and General Debility, after suffering upwards of 25 years, thinks it his duty to make the remedy known for the benefit of the afflicted; he will therefore forward the particulars for the cure of the same on receipt of a stamped envelope properly directed.—Address Rev. J. JOHNSTONE, No. 1, Park Terrace, Heavitree, Exeter, Devonshire.

A CLEAR COMPLEXION,

GODFREY'S EXTRACT OF ELDER FLOWERS is strongly recommended for softening, beautifying, and preserving the skin, and giving it a blooming and charming appearance, being at once a fragrant Perfume and delightful Cosmetic. It completely removes tan, sun-burn, redness, &c., and by its balsamic and healing qualities renders the skin soft, and free from dryness, scurf, &c.; clears it from every humour, pimple, or eruption; and by continuing its use only a short time the skin becomes and continues soft and smooth, and the complexion clear and beautiful. In the process of shaving it is invaluable, as it annihilates every pimple and all roughness, and affords great comfort if applied to the face during cold easterly winds.—Sold in Bottles, price 2*s.* 9*d.*, with directions for using it, by all Medicine Vendors and Perfumers.

HOLLOWAY'S PILLS AN EXTRAORDINARY REMEDY FOR THE CURE OF BILE AND LIVER COMPLAINTS.—Copy of a letter from Mr. W. Baldwin, of New Brompton, Kent, dated August 25, 1855. "To Professor Holloway: Dear Sir,—Having suffered for several years from a disordered liver, and finding medical aid of no avail, I was induced to try your invaluable Pills, and after taking them for a short time, I have the greatest pleasure to inform you that they have been the means of restoring me to perfect health. Signed, W. Baldwin."—Sold by all Medicine Vendors throughout the world; at Professor HOLLOWAY'S Establishments, 244, Strand, London, and 80, Maiden Lane, New York; by A. STAMPA, Constantinople; A. GUIDICY, Smyrna; and H. HOODS, Malta.

DR. ARNOT'S PILLS WILL CURE YOU!! The extraordinary curative properties of this new discovery in medicine will be proved by a trial. Through their peculiar action upon the system new and pure blood is manufactured, the morbid conditions of the body removed, the constitution strengthened, and health restored. Indigestion, bile, stomach, and bowel complaints, gout, rheumatism, asthma, scrofula, dropsy, ulcers, &c., and all diseases arising from impurities of the blood, and other vital fluids are speedily eradicated by this MIRACULOUS MEDICINE.—Sold in boxes at 1*s.* 1½*d.*, by all chemists. By post 14 stamps. Depôt, 50, Rathbone Place, London.

DEBILITY AND NERVOUSNESS.—Encouragement to those in despair, and suffering from debility, spermatorrhœa, relaxation, nervousness, and exhaustion of the system. Advice and prescriptions, with a treatise on these diseases, for a successful course of self-treatment, by which a permanent cure of the most protracted case is effected, sent post free upon receipt of 14 postage stamps, by E. J. ROBERTS (late Army), Surgeon, 9, North Terrace, Moor Edge, Newcastle-on-Tyne.

TO NURSERYMEN, GARDENERS, AND OTHERS.

THE BURIAL BOARD FOR THE PARISH OF HADLEIGH, in the County of Suffolk, is desirous of receiving TENDERS for the LAYING-OUT, FENCING, and PLANTING the NEW BURIAL GROUND, containing 3½ acres, according to the Plan and Specification of Mr. E. G. Pennington, which may be seen at my Office on any day between the hours of 9 and 6 o'clock, at which place Tenders must be delivered on or before WEDNESDAY, the 12th day of September next. The Board does not pledge itself to accept any Tender. J. F. ROBINSON, Clerk to the said Burial Board.

Hadleigh, Suffolk, Sept. 8.

WANTED, at Michaelmas, a FARM of about 200 Acres of good Land. Rent must be moderate. Essex or Kent preferred.—Direct B. H., Post-office, Hockley, Essex.

TO BE LET ON LEASE, SION NURSERY, CROYDON, situated on the road between Norwood and Croydon, and two miles from the Crystal Palace. It contains nearly 7 acres of Land, a good Dwelling-house, several Greenhouses and Pits, with Stable shed, &c. It is well stocked with Shrubs, Trees, and Plants, which can be taken at a valuation.—Further particulars can be had of the present occupier at the Nursery.

TO FLORISTS, GENTLEMENS' GARDENERS, & OTHERS.

TO BE SOLD, by SAMUEL RODWAY, with immediate possession, a FLORIST and SEED BUSINESS, in the best situation within 20 miles of Birmingham; the present proprietor retiring, who has for the last 12 years gained more prizes than any other nurseryman in the Midland Counties. To any industrious party who understands the above business such an opportunity rarely occurs. The stock of Plants, Greenhouses, &c., to be taken at a fair valuation, which will be about 300*l.*, part of which may remain upon approved security. The rent moderate, and payments exceedingly low.—For particulars and to treat, apply to SAMUEL RODWAY, Auctioneer and Appraiser, Woodman Inn, Pershore Road, Birmingham.

TO BE LET, an old-established NURSERY, with a Seed Trade, situate near a large Market Town, and on a main line of railroad, in a very eligible situation for business. The quantity of Land can be made to suit the convenience of the tenant, in proportion to which there is a fair extent of glass.—For further particulars, address A. B., Office of this Paper.

TO GENTLEMEN, GARDENERS, FLORISTS, & OTHERS.

TO BE SOLD, about three miles from Covent Garden, a NURSERY and FLORIST'S BUSINESS, consisting of 1½ acres of Land, 15,000 feet of Glass: comprising Greenhouses, Pits and Frames; the whole well stocked and in excellent condition; together with two cottages (one with a shop) in a first-rate situation for business. Held in an unexpired Lease of 18 years. Rent free. The whole Stock, Houses, Land, and Goodwill of a thriving trade for One Thousand Pounds! The Advertiser wishes to leave solely on account of joining some relatives abroad.—Address A. B., Mr. Rogers (Clock House), King's Road, Chelsea.

TO BE SOLD, a CONSERVATORY, 20 feet long, 11 feet wide; likewise several small GREENHOUSES.—Address to Mr. SMITH, Greenhouse Builder, Painter, and Decorator, 4, Canonbury Cottages, Lower Road, Islington.

☞ Greenhouse Lights and Window Sashes made and glazed at 8*d.* per foot, and all kinds of Joiners' Work Estimated for. Reference given.

TO BE SOLD, a few one and two SHEAR GIMMERS, price 2*l.* 2*s.*, by a gentleman who has for several years paid great attention to the breeding of the Black and White Spotted Spanish Sheep; also some RAM LAMBS, 1*l.* 10*s.* each, delivered at the Thirsk Station of the North Eastern Railway. —Address to Mr. W. KIRBY, Kirkby Wiske, Thirsk.

Sales by Auction.

ORCHIDS.

MR. J. C. STEVENS is favoured with instructions to Sell by Auction at his Great Room, 38, King Street, Covent Garden, on WEDNESDAY, 12th September, at 1 o'clock precisely, a most important and valuable collection of ORCHIDS, the property of ROBERT HANBURY, Esq., consisting of all the best varieties of Ærides, Saccolabiums, Vandas, Cattleyas, &c., in fine specimens.—May be viewed on the morning of Sale, and Catalogues had.

THE LATE MRS. LAWRENCE'S COLLECTION OF ORCHIDS.

MR. J. C. STEVENS is favoured with instructions to Sell by Auction, at his Great Room, 38, King Street, Covent Garden, on TUESDAY, September 18, and following day, at 1 o'clock precisely, the Valuable Collection of Orchids removed from Ealing Park; comprising fine healthy specimens of the rarest Saccolabiums, Vandas, Aerides, Phalænopsis, Dendrobiums, Cypripediums, Cattleyas, and other choice South American and East Indian Species, cultivated in the best possible manner by Richard Franklin. May be viewed on the morning of Sale, and Catalogues had of Mr. J. C. Stevens, 38, King Street, Covent Garden.

EALING PARK.

THE LATE MRS. LAWRENCE'S RENOWNED COLLECTION OF PLANTS.

MR. J. C. STEVENS is favoured with instructions to Sell by Auction, at the Gardens of Ealing Park, on THURSDAY, September 20, and two following days, at 1 o'clock precisely, the whole of the PLANTS contained in the 15 Stoves and Greenhouses at Ealing Park, comprising about 1200 specimens of the choicest Exotics, Heaths, Camellias, Azaleas, &c. This unrivalled collection is in the best condition, the cultivation having been for some years past under the able superintendence of Mr. William May, whose ability as a grower of specimen plants is proverbial.—Catalogues (which are preparing) will be ready about ten days before the sale, and may be had of Mr. J. C. STEVENS, 38, King Street, Covent Garden. (Four stamps if prepaid).

IMPORTANT SALE OF VALUABLE TULIPS.

MESSRS. PROTHEROE AND MORRIS have received instructions from Mr. John Slater, Florist, Cheetham Hill, near Manchester, to Sell by Auction, on WEDNESDAY, September 19, at the Auction Mart, at 12 o'clock, a VERY SELECT PORTION OF THE FINEST STRAINS OF HIS TRULY VALUABLE COLLECTION OF TULIPS, amongst which may be enumerated Arlette, Colbert, Queen of the North, Lady Catherine Gordon, Ethelstan, La Belle Nanette, &c., the finest varieties of the Chellastons, as well as a few of his own Seedlings, remarkable for form and purity, many of which have not yet been distributed.—Catalogues may be had on application to the Auctioneers, American Nursery, Leytonstone, Essex, on Tuesday, Sept. 11th; or of Mr. John Slater.

SOUTH DEVON.

STOCK FARM, 218 ACRES, WITH WATER POWER.

MESSRS. DAVIS AND VIGERS are directed to Sell by Auction, at the Mart, London, on THURSDAY, September 27th, at 12 for 1 o'clock, the FREEHOLD FARM, called "Hutcherley," situate in the parishes of Blackawton and Halwell, south of the high road, five miles from Kingsbridge and six miles from Totness. It includes 26 acres of rich water Meadow, 66 of fine Pasture, 9 of Orchard, 4½ of Woodland, and 111 of Arable, with Residence and Farm Buildings. The climate is singularly mild, salubrious, and favourable to stock, and the soil is adapted to Grass and Root cultivation, as well as Corn. The Pasture may be grazed either to fatten or for dairy purposes. —May be viewed on application to Mr. JOHN GRANT, on the premises, of whom particulars with plans may be had; also of JOHN ANDREWS, Esq., Solicitor, Modbury; at the Stars Inn, Totness; the King's Arms Inn, Kingsbridge; the Castle Inn, Dartmouth; at the Mart, and Auctioneers' Offices, 3, Frederick's Place, Old Jewry, London.

ROTHERHITHE, SURREY.

TO MARKET-GARDENERS, NURSERYMEN, AND OTHERS.

MR. W. T. ATTWOOD has received instructions to sell by Auction, without reserve, on the premises, Lower Road, Rotherhithe, on THURSDAY, Sept 20, at 12 o'clock, the Live and Dead STOCK and CROP of a Market Gardener, comprising about 20,000 roots of Linnæus, Victoria, and other Rhubarb, 3 acres of Horseradish, 15,000 yearling Seakale plants, young Mint, Potatoes and other crops; also 30 3-light Boxes and Lights, 200 Hand-glasses, Cart Horse, Market Carts, Baskets, Implements, Tools, &c.: 300 loads of Manure.—May be viewed previously to sale.

GATE BURTON, NEAR GAINSBOROUGH.

IMPORTANT SALE OF SHORT-HORNED CATTLE.

MR. STRAFFORD is favoured with instructions to announce for Sale by Auction, without reserve, on WEDNESDAY, the 26th September next, at Gate Burton, near Gainsborough, Lincolnshire, the entire herd of SHORT-HORNED CATTLE, the property of Wm. Hutton, Esq., consisting of about 75 head of Bulls, Cows, and Heifers, chiefly bred from Cows purchased of the late Earl Spencer, and since crossed by first-class bulls from the far-famed Wiseton Herd, and others bred by Lord Feversham, Messrs. Fawkes, Wilkinson, &c. The Cattle are in a healthy breeding state, not having been forced for sale, and are well worthy the attention of purchasers of superior stock. They are to be disposed of in consequence of Mr. Hutton having let a portion of the farm recently in hand.—Catalogues, with pedigrees and other particulars, may be had on application to Mr. STRAFFORD, 13, Euston Square, London; or of WRIGHT, Knaith, near Gainsborough.

HORTICULTURAL BUILDING

AND

HEATING BY HOT WATER.

AT THE LOWEST PRICES

CONSISTENT WITH GOOD

MATERIALS & WORKMANSHIP.

GRAY & ORMSON, DANVERS STREET, CHELSEA, LONDON.

GRAY AND ORMSON, Danvers Street, Chelsea, having had considerable experience in the construction of Horticultural Erections, which, for elegance of design, good materials, and workmanship, combined with economy and practical adaptation, cannot be surpassed by anything of the kind in the country, are in a position to execute orders on the lowest possible terms.

G. & O. have been extensively employed by the Nobility, Gentry, and London Nurserymen; and they can with the greatest confidence give the most satisfactory references to all by whom they have been favoured with orders. Their Hot-water Apparatus is also constructed on the most approved and scientific principles, for all purposes to which the application of Heating by Hot Water can be made available.

Superior Hair and other Toilet Brushes.

HORTICULTURE IN ALL ITS BRANCHES.

JOHN WEEKS & Co., King's Road, Chelsea,

HOTHOUSE BUILDERS.

THE NOBILITY AND GENTRY about to erect Horticultural Buildings, or fix Hot-water Apparatus, will find at our Horticultural Establishment and Hothouse Works, King's Road, Chelsea, an extensive variety of Hothouses, Greenhouses, Conservatories, Pits, &c., erected, and in full operation, combining all modern improvements, so that a lady or gentleman can select the description of House best adapted for every required purpose.

The HOT-WATER APPARATUS, which passes through all the Houses and Pits affording both top and bottom heat, is in constant operation and particularly worthy of attention.

Many of the Houses and Pits are of wide and lofty dimensions, and together equal in length 1000 feet. They are all effectually heated by *one boiler*, which, during the severe winter months does not cost in labour and fuel more than 3*s.* 8*d.* per day, and the apparatus is so arranged that each House or Pit may be heated separately and to the required temperature. The splendid collections of Stove and Greenhouse Plants are also in the highest state of cultivation, and for sale at very low prices. Also a fine collection of strong Grape Vines in pots, from eyes, all the best sorts.

Plans, Models, and Estimates of Horticultural Buildings; also Catalogues of Plants, Vines, Seeds, &c., forwarded on application to JOHN WEEKS & Co., King's Road, Chelsea, London.

HEATING BY HOT WATER.

JOHN WEEKS & Co., King's Road, Chelsea, Horticultural Builders and Hot Water Apparatus Manufacturers. At our two Establishments horticultural science is fully carried out in all its branches.

The accompanying sketch represents our Improved Boiler. These Boilers are very powerful, durable, and economical. The whole of our extensive nursery establishment is heated by *one boiler*, measuring only 5 ft. by 3 ft. 6 in. The Houses heated consist of forcing-houses of various descriptions, many of them are of wide and lofty dimensions, in length 1000 ft., and exposing to the atmosphere upwards of 16,000 superficial feet of glass. During the late severe winter it only cost us 3*s.* per day for fuel, and we had more than a sufficient command of heat. Any number of forcing-houses can be heated by *one of our Boilers*, and any part regulated at pleasure. Plans, Models, and Estimates of Horticultural Buildings, or Heating by Hot Water, forwarded on application.

JOHN WEEKS & Co., King's Road, Chelsea, London.

Printed by WILLIAM BRADBURY, of No. 13, Upper Woburn Place, and FREDERICK MULLETT EVANS, of No. 20, Queen's Road, West, both in the Parish of St. Pancras, and in the County of Middlesex, Printers, at their Office in Lombard Street, in the Precinct of Whitefriars, in the City of London; and published by them at the Office, No. 5, Upper Wellington Street, in the Parish of St. Paul's, Covent Garden, in the said County, where all Advertisements and Communications are to be ADDRESSED TO THE EDITOR.—SATURDAY, September 8, 1855.

NORTH LONDON FLORICULTURAL SOCIETY.—An EXHIBITION of Dahlias, Fuchsias, Verbenas, and Miscellaneous Plants, open to all England, will be held under the auspices of this Society, in the Penton Rooms, Pentonville, on TUESDAY, September 18th. Omnibuses every five minutes from the North-Eastern, London Bridge, Great Western, North Western, and Great Northern Railways, pass within a few yards of the Exhibition, which promises to be one of the most attractive metropolitan displays of the season. Seedling productions will be furnished in great abundance by all the best raisers; lovers of novelty may, therefore, make sure of a treat.—For Schedules, tickets, &c., apply to George Smith, Hon. Sec.

Tollington Nursery, Hornsey Road, Islington.

*** The Advertisement of this Society inserted last week announced by mistake the Exhibition to take place on *Wednesday*, the 19th.

NATIONAL FLORICULTURAL SOCIETY, 21, Regent Street.—The THIRTEENTH EXHIBITION will be held on THURSDAY next, September 20th, when all subjects in competition for Prizes must be staged by 12 o'clock; Seedlings for examination by 1 o'clock. The Prizes and Awards shall be made known at 3 o'clock, when also will be PAID the SEVERAL PRIZES AWARDED during the past season. Prizeholders are therefore requested to attend.

Censors:—Dr. Sladden, Ash; Messrs. C. J. Perry, Birmingham; Thomas Barnes, Stowmarket; and J. Dodds, Salisbury.

John Edwards, Secretary.

TO NURSERYMEN AND OTHERS.

IPSWICH CEMETERY.—The BURIAL BOARD for the BOROUGH OF IPSWICH are prepared to receive TENDERS for PLANTING to be done in their Cemetery during the present autumn. Forms of Specification with Schedules, and quantities may be obtained on payment of 5*s*. for each copy, on and after the 26th day September, at the Offices of the Board, in the Woodbridge Road, Ipswich, and at the office of Mr. Davidson, Landscape Gardener, 36, Great Russell Street, Bedford Square, London.—Ipswich, September 15.

WILLIAM BARRATT, Landscape Gardener, Wakefield.

*** Plans and Estimates furnished.

LANDSCAPE GARDENING, GARDEN ARCHITECTURE, AND GENERAL IMPROVEMENT OF DOMAINS, WOODS, PLANTATIONS, &c.

Charles M'Intosh, F.R.P.S., A.L.S., &c., Author of the "Book of the Garden" and other works on Horticulture, &c. Late Curator of the Gardens of his Majesty the King of the Belgians at Claremont and Brussels, and latterly of those of his Grace the Duke of Buccleuch at Dalkeith Palace.

Newcome Villa, Murrayfield, Edinburgh.

MR. THOMAS LOBB respectfully offers his service as BOTANICAL COLLECTOR to any gentleman who takes an interest in the importation of Indian Plants. Ten years' experience in the above capacity has rendered him familiar with the native languages, modes of travelling, and the best localities for valuable Plants. He is able to state with confidence that a mission undertaken at this favourable season of the year would enable him to form extensive collections of Orchideæ, &c., for immediate transmission.—Letters prepaid, addressed to Deveron, Truro, Cornwall.

DICKINSON'S ITALIAN RYE-GRASS SEED is now ready for delivery, for present payment only, 7*s*. per bushel.—New Park, Lymington, Hants.

SEEDLING CINERARIAS, 1*s*. 8*d*. PER DOZEN, Box and Package Included.

W. WHITEHOUSE has to offer a few hundreds of strong healthy plants, raised from all the new varieties of last year. Post-office orders payable at Birmingham, or postage stamps required with the orders.

Mount Pleasant Nursery, Harborne, Birmingham.

PYRAMIDAL PEARS ON QUINCE STOCKS, AND ORCHARD HOUSE TREES IN FULL BEARING.

MR. THOS. RIVERS begs to announce that the large Collection of the above at Sawbridgeworth is now in perfection. The Harlow Station of the Eastern Counties Railway, about one mile from the Nursery, is the most convenient.

The Nurseries, Sawbridgeworth, Sept. 15.

WANTED,

GRAPES AND PEACHES OF Superior Quality. Forward to GEORGE TAYLOR, Jun., Fruit Salesman, St. John's Market, Liverpool. Terms Cash.

TO BE SOLD, the LODDIGES' COLLECTION OF ORCHIDS.—This unrivalled collection containing upwards of 1200 species and 2000 specimens (many of which are unique), in the finest possible health, is now to be disposed of in one Lot, affording an opportunity to any nobleman or gentleman desirous of commencing the cultivation of this beautiful tribe of plants which has never before occurred.—For terms and to view apply to C. Loddiges, Hackney.

FOR PRESENT SOWING.

NEW ITALIAN RYE-GRASS AND TRIFOLIUM INCARNATUM SEED MAY NOW BE OBTAINED FROM SUTTON AND SONS, Seed Growers, Reading, Berks.

Remittances or references are requested from unknown correspondents.

SUTTON'S RENOVATING GRASS SEEDS MAY NOW BE SOWN.—The Grass Lands sown with these Seeds last Spring are greatly improved (*vide* letters recently received).

Price of Seed 9*d*. per lb., or 80*s*. per cwt. Quantity required, 8 to 12 lbs. per acre.

NEW SEEDS.—GROWTH OF 1855.

WILLIAM E. RENDLE AND Co., Seed Merchants, Plymouth, are now harvesting in fine condition their General Collection of Agricultural and Garden Seeds for the coming season.

In order to give increased facilities for conducting their Seed Business, they are now considerably enlarging their offices and warehouses, which, when completed, will enable them to attend to all orders with promptness and despatch.

William E. Rendle & Co., Seed Merchants, Plymouth. Established 1786.

TO THE SEED TRADE.

GEORGE TABER, of Ravenhill, Essex, begs to inform the Trade that his growing crops of Seeds are now open to inspection. All Turnip Seeds grown from sound transplanted roots. Lists sent on application.—Sept. 15.

BARRATT'S MAGNUM BONUM has this year fully sustained its high character as one of the finest flavoured STRAWBERRIES known, and may now be had at 20*s*. per 100, or 3*s*. per doz.—Catalogues containing all the leading varieties of the day may be obtained from William Barratt, St. John's Nurseries, Wakefield.

DOUBLE ROMAN AND PAPER WHITE NARCISSUS, 4*s*. per dozen.—The above Bulbs, the former of which is so justly esteemed for its early blooming and excessive fragrance, and the latter for its purity and elegance, have just arrived, and may be obtained at A. Cobbett's Italian and Foreign Warehouse, 18, Pall Mall, near Waterloo Place, London.

FINE FRINGED CHINESE PRIMROSE.

J. AND J. FRASER beg to offer some excellent Seed of the above, saved from plants which obtained the award of the Horticultural Society last winter, in packets at 2*s*. 6*d*. each. A remittance in stamps is requested from unknown correspondents.—Lea Bridge Road, Sept. 15.

VINES FOR FRUITING IN POTS.

MESSRS. J. AND J. FRASER, Nurserymen, Lea Bridge Road, Essex, beg to announce that they have a very choice selection of the best sorts of VINES from eyes grown in 12 and 15-inch pots, Price 5*s*. and 7*s*. 6*d* each.

N.B. Strong Vines for planting out, 3*s*. 6*d*. each.—Sept. 15.

GRAPE VINES FROM EYES.

Milford Nurseries, near Godalming, Surrey.

HYACINTHS.

MESSRS. E. G. HENDERSON & SON

BEG to announce that they have now received their noted collection of HYACINTHS in excellent condition. They also beg to state, that having been for nearly 50 years the largest and most successful cultivators of this highly popular Flower in the vicinity of London, they can with confidence recommend the varieties named in their Catalogue as being the most suitable for pot or glass culture, and every way worthy the attention of Amateurs, &c.

Catalogues can be had on application, and for the assistance of those persons unacquainted with the culture of the Hyacinth, printed instructions will be given gratis with each order they are kindly favoured with.

CUCUMBER—HENDERSON'S "NAPOLEON III."

E. G. H. & Son have great pleasure in informing those who are fond of a really good Cucumber that they have succeeded in obtaining the stock of the above variety. It is one of the best for Winter culture and early forcing; is a free bearer and perfect in its form, possessing, indeed, all those qualifications of a good Cucumber which the most fastidious could desire. In packets, containing two seeds, 3*s.* each; ditto ditto, four seeds, 5*s.* 6*d.* each.

FLOWER SEEDS FOR AUTUMNAL SOWING.

Collections containing 12 distinct varieties, with printed instructions, 3*s.* 6*d.* each, postage free; ditto, 24, 6*s.*; 36, 8*s.* 6*d.*; 48, 10*s.* 6*d.*

CALCEOLARIA, CINERARIA, AND PRIMULA,

Saved from the choicest varieties, may be had in packets at 2*s.* 6*d.* and 5*s.* each; the finest quality of Calceolaria is only offered at 5*s.*; second quality, 2*s.* 6*d.* The finest fimbriated Primula in the country, 2*s.* 6*d.*

Established more than 100 years.

WATERPROOF PATHS.
BARN AND CATTLE SHED FLOORS.

THOSE who would enjoy their Gardens during the winter months should construct their walks of PORTLAND CEMENT CONCRETE, which are formed thus:—Screen the gravel of which the path is at present made from the loam which is mixed with it, and to every part of clean gravel add one of sharp river sand. To five parts of such equal mixture add one of Portland Cement, and incorporate the whole well in the dry state before applying the water. It may then be laid on 2 inches thick. Any labourer can mix and spread it. No tool is required beyond the spade, and in 48 hours it becomes as hard as a rock. Vegetation cannot grow through or upon it, and it resists the action of the severest frost. It is necessary, as water does not soak through it, to give a fall from the middle of the path towards the sides.

The same preparation makes first-rate paving for BARNS, CATTLE-SHEDS, FARM-YARDS, and all other situations where a clean, hard bottom is a desideratum. May be laid in winter equally well as in summer.

Manufacturers of the Cement, J. B. White & Brothers, Milbank Street, Westminster.

THE PAMPAS GRASS,
"GYNERIUM ARGENTEUM."

LUCOMBE, PINCE, AND Co. have now for sale a healthy stock of well established Plants of the above, which will bloom finely this autumn, varying from one to two and three flower stems. Few Plants are more ornamental than this gigantic Grass, the leaves (which are more than 7 feet in length curving gracefully outwards) grow in large tussocks, thereby producing a very fine effect, and from the midst of these numerous flower stems arise to the height of from to 6 to 8 feet surmounted by elegant panicles of inflorescence nearly 3 feet long, resembling beautiful waving plumes of silvery feathers. It is perfectly hardy, and is also easy of cultivation. A grand specimen of this noble plant is now in the Exeter Nursery, pushing up nearly twenty large flower stems and numerous small ones, and will continue to be an object of great attraction for a considerable time. Prices and full particulars may be had on application to

LUCOMBE, PINCE, & Co., EXETER NURSERY, EXETER.
Established 1720.

MYATT'S ADMIRAL DUNDAS STRAWBERRY.—Strong plants packed and delivered free in London, 25*s.* per 100. Also MYATT'S British Queen, Cinquefolia, Globe, Eliza, Mammoth, 3*s.* 6*d.* per 100; Keens' Seedling, Hooper's Seedling, Black Prince, Bicton Pine, 3*s.* 6*d.* per 100.

MYATT'S BRITISH QUEEN.—In reply to several correspondents, and in confirmation of the private answers I gave last summer, I beg leave to state that the only Strawberry bearing the name of "British Queen" is MYATT'S, and when Mr. Beach, in his advertisement says "his true British Queen," he is obviously in error, and arrogates to himself the credit due to my late father, Mr. JOSEPH MYATT, who was the originator of the variety in question.—W. MYATT, Manor Farm, Deptford.—Sept. 15.

VIOLETS.

R. SHACKELL begs to offer strong Plants of his superior Violet Russian Superb, at 4*s.* per dozen; strong plants of the Neapolitan Violet, now fit for potting, at 4*s.* per dozen; Double Perpetual Tree Violet, at 4*s.* per dozen; single sweet winter blooming White Violet, at 4*s.* per dozen; Double White do., 4*s.* per dozen; old Russian Violet, 10*s.* per 100 plants. hamper and package included for all orders above 10*s.*

R. S. would be happy to enter into arrangements with any retail Florist for supplying Bouquets of Violet blooms after the 1st of October until the 1st of March, provided the weather permit, at 5*s.* per 100. Bouquets almost to any extent.

ROBERT SHACKELL, Locksbrook Nursery, Bath.

NEW PELARGONIUMS.

GEORGE SMITH has a fine Stock of the following first class PELARGONIUMS in strong Plants, at from 30*s.* to 40*s.* per dozen, according to the sizes of Plants, hamper included with Plants to compensate for carriage:—(Forster's), Jessica, Phaeton, Seraskier; (Hoyle's), Hubert, Lord Raglan, Omar Pasha, Serena, Topsy, Wonderful, Yerda, Zoe; (Beck's), Conqueror, Dido, Fidelia, Laura, Lydia, Silenus; (Turner's), Grand Sultan, Pandora; (Forquett's) Petruchio; (Story's), Fair Ellen, Snowflake; (Horken) Una; (Cant's) Vespa; (Dobson's) Commander-in-Chief; (Fuller's) Gem of the West. With a choice assortment of show and fancy kinds. A descriptive Catalogue on application. Unknown correspondents forwarding a remittance with their orders will be liberally dealt with. Post-office orders payable at Islington.

Tollington Nursery, Hornsey Road, Islington, London.

SPLENDID NEW BEGONIA, SEMPERFLORENS SAUNDERSI.

GARAWAY, MAYES, AND CO. are now prepared to execute orders for this fine Seedling Begonia (raised by Mr. F. Saunders, Gardener to W. Miles, Esq., M.P., Leigh Court), which is, without exception, the most useful and beautiful variety in cultivation. The original plant first bloomed in May, 1854, when only 6 inches high, and has continued without ceasing to produce from the axils of every leaf its splendid panicles of transparent vermilion buds, which develope to fine clear brilliant rose flowers, emitting a most agreeable odour. Its habit is close and compact, seldom attaining more than 3 feet; foliage small and extremely bright, forming altogether an object of beauty unrivalled by any other variety in its class. Price 10*s.* 6*d.* each, with an allowance to the trade of one upon every three ordered; also a few extra sized plants at 15*s.* and 21*s.*

Durdham Down Nurseries, Bristol.

RHODODENDRONS.

JOHN WATERER begs to announce that he is now prepared to execute orders for his two New Hardy Hybrid Rhododendrons, in good established plants, at 42*s.* each.

Rhododendron JOHN WATERER, colour glowing carmine, large truss, fine foliage, and a most abundant bloomer, in perfection about the 15th June.

Ditto, MRS. JOHN WATERER, a bright rosy crimson, fine conical truss, a very free blooming kind, in flower about 15th of June.

To the admirers of this justly noble class of Plants, JOHN WATERER has the pleasure of recommending the above as being the greatest acquisitions yet offered. They combine in a marked degree the necessary requisites for really first-rate hardy crimson varieties, viz., imposing colours, abundant bloomers, extreme hardiness, and flower at a time when they are not liable to be injured by spring frosts.

The American Nursery, Bagshot, Surrey, Sept. 15.

NEW FUCHSIAS.

STEWART AND NEILSON have selected the following fine varieties from 3000 Seedlings of this year that may now be seen in flower, plants of which will be ready to be sent out by the 1st of April, at the prices named. The usual allowance to the trade.

EMPRESS EUGENIE.—Tube and sepals white, corolla rosy purple, well reflexed, good habit, free bloomer. 10*s.*

LOUIS NAPOLEON.—Tube and sepals fine crimson, corolla violet, well reflexed, extra good habits, free bloomer. 10*s.*

PRINCESS ROYAL.—Tube and sepals pure white, corolla dark rose, not reflexed, good habit, free bloomer. A very distinct variety. 10*s.*

PRINCE OF WALES.—Tube and sepals rosy crimson, corolla dark violet, well reflexed, dwarf habit, free bloomer. 10*s.*

GENERAL SIMPSON.—Tube and sepals dark crimson, corolla dark purple brown, well reflexed, free bloomer. 7*s.* 6*d.*

COLONEL LAWRENCE.—Tube and sepals crimson, corolla dark purple, well reflexed, extra large flower. 7*s.* 6*d.*

MRS. J. NAYLOR.—Tube and sepals bright crimson, corolla fine puce, well reflexed, good habit, free bloomer. 7*s.* 6*d.*

Nursery, Liscard, Cheshire, near Liverpool, Sept. 15.

THE IMPROVED BROWICK RED AND OTHER SEED WHEAT.

WILLIAM BARNES, in returning thanks to his customers for SEED CORN, begs to offer this season the following sorts, which have been procured from the finest and best varieties, regardless of expense in the purchase and cost in the cultivation—viz., Improved Browick Red, Spalding's Red, Old Red or Lammas Wheat, White Chaff Red, and Bristol mixed with White, all of which he will warrant *true and clean.*

Mr. B. can recommend the Improved Browick Red with much confidence as being one of the greatest acquisitions in Red Wheat, for light or black land, yet offered to the farmer. In this locality (Deeping Fen) it was less injured by frosts and mildew than other Reds, and was pronounced by all who inspected it whilst standing over several acres to be unrivalled by any in the district.—For further particulars, address WILLIAM BARNES, the Elms Farm, near Spalding, Lincolnshire.

DOWNIE AND LAIRD, NURSERYMEN and SEEDSMEN, 17, South Frederick Street, Edinburgh, beg to intimate that they are now sending out their NEW PHLOX "Countess of Home," figured in Turner's "Florist" of December last; it has been awarded First Class Certificates at the Royal South London Floricultural Society on the 30th August and the National Floricultural Society on the 6th August, and is unquestionably one of the finest Phloxes yet raised; white with distinct dark crimson centre, form perfect, grows to the height of 2 feet. Price 5*s.* each, and may be had of any of the following nurserymen in England:—

Messrs. Hugh Low & Co., Clapton, London.
Messrs. E. G. Henderson & Son, Wellington Road, London.
Messrs. William Rollison & Son, Tooting.
Messrs. Arthur Henderson & Co., Pine-apple Place, London.
Mr. Wm. Barnes, Camberwell, London.
Mr. John Salter, Hammersmith, [London.
Messrs. Wm. Wood & Son, Maresfield, Uckfield.
Mr. John Keynes, Salisbury.
Mr. Charles Turner, Slough, Windsor.
Mr. John Cattell, Westerham, Kent.
Mr. W. B. Bircham, Hedenham Rosary, Bungay, Suffolk.
Mr. Wm. Chater, Saffron Walden, Essex.
Messrs. Wm. Paul & Son, Cheshunt, Herts.
Messrs. Cole & Sharp, Birmingham.
Messrs. Moore & Son, Perry Barr, Birmingham.

Also from most of the leading Nurserymen in Scotland.

FISHER, HOLMES, AND CO. beg to offer the following, all of which are good healthy Plants.

Abelia uniflora, each 9*d.* to 1*s.* 0*d.*		Escallonia pterocladon	5*s.* 0*d.*
Azalea amœna	1 0	Eugenia Ugni ... 1*s.* 6*d.* to	2 6
„ Stanleyana... ...	1 6	Fuschia, Florence Nightingale	1 6
„ Symmetry	1 6	„ Lady of the Lake	1 0
The following are from 1*s.* to 1*s.* 6*d.* each:—		„ Climax ... 1*s.* to	1 6
Azalea Frosti		„ Empress Eugenie	1 0
„ aurantia superb		„ violæflora pleno ...	1 0
„ lateritia pulchra		„ Dominiana... ...	1 6
„ Apollo		Henfreya scandens ...	1 0
„ white		Hexacentris mysorensis	1 6
„ „ double		Hoya bella	1 0
„ fulgens		Hydrangea japonica variegata ... ... 1*s.* to	2 6
„ Duke of Wellington		Ixora coccinea	1 6
„ optima		„ javanica	1 6
„ extrani		„ salicifolia	2 6
„ decora		Impatiens Jerdoniæ, 1*s.* 6*d.* to	2 6
„ amabilis		Lycopodium umbrosum	0 9
„ Hebe.		„ inæqualifolia ...	1 0
Æschynanthus speciosus, fine plants ...	1 6	„ Poeppigiana ...	1 0
„ splendidus, do. ...	1 6	„ viticulosa	0 9
Acacia verticillata ...	1 0	„ apothecum	1 0
Agapanthus umbellatus, fol. var....	1 6	„ formosum	1 0
Begonia Prestoniensis, fine plants	1 0	„ cœsium arboreum...	1 0
Boronia Drummondi ...	2 6	Mandevillea suaveolens	1 6
Burchellia capensis 1*s.* to	1 6	Maranta alba lineata ...	2 6
Caladium bicolor superba... ... 1*s.* 6*d.* to	2 6	Mitruria coccinea ...	0 9
Clerodendron splendens	1 6	Mussænda frondosa ...	1 6
Cyrtoceras reflexum ...	2 6	Pentas rosea	1 0
Dipladenia crassinoda ...	1 6	Pimelea Hendersoni ...	2 6
Desmodium gyrans ...	1 6	„ spectabilis	2 6
Eranthemum leuconervum	1 0	Swansonia Lessertifolia	2 6
Erythrina crista-galli, 1*s.* to	1 6	Statice Halfordi, fine plants ... 1*s.* 6*d.* to	2 6
		„ sinuata	0 9
		Veronica variegata ...	1 0

Remittances respectfully requested from unknown correspondents.—Handsworth Nursery, Sheffield, Sept. 15.

MESSRS. WILLIAM ROLLISSON AND SONS are desirous of directing the attention of the Nobility and Gentry, who are about to plant or make alterations in their Ornamental and Pleasure Grounds, to their immense Stock of AMERICAN PLANTS, in all sizes, which extends over an area of several acres. In large plants there are several thousands, and of such as Rhododendron catawbiense, Kalmia latifolia, Rhododendrum ponticum in varieties, and other choice hardy hybrids; many of them stand 5 to 6 feet high, and the same through, and literally covered with flower-buds.

Messrs W. R. and Sons are happy to say that their Dwarf and Standard trained, and other Fruit Trees, are this season remarkably fine; they have also a splendid lot of fruiting plants of Peaches, Nectarines, and Apricots in pots, which can be recommended as being exceedingly fine.

NEW PLANTS.

Messrs. WILLIAM ROLLISSON and SONS are now prepared to offer the annexed:—

COLEUS BLUMEI PECTINATUS.—This variety is a great acquisition; the foliage is variegated similar to Coleus Blumei, but the leaves are beautifully laciniated; 7*s.* 6*d.* each.

MANDIROLA ROEZLI.—A very fine flowering gesneraceous plant, producing fine spikes of lilac coloured blossoms, 15*s.* each.

ORTHOSIPHON SPICATUS.—A beautiful new greenhouse plant from Oeano, much to be desired for its foliage alone, which is deliciously fragrant; the flowers are large and white; 10*s.* 6*d.* each.

MANDIROLA LANATA.—A very curious free flowering gesneraceous plant of a delicate violet colour inside the mouth of the blossoms, and shaded lilac outside; 15*s.* each.

NEW CHRYSANTHEMUMS.

The Undermentioned can be supplied at 24s. per dozen.

Aureole, Aigle d'or, Arc-en-ciel, Adèle Prissette, Alexandre Pelé, Comtesse de la Chastnes, Créole, Duruffe, Danais, Eldorado, Fortunio, Figaro, Fimbriata rosea, Hemène, Iris, Il Brasiero, Io, La Promise, La Carmélite, General Lafont, Mdlle. Clemence, Néréide, Precarieuse, Parpaillot, Rachel, Robert Bruce, Rose Bouquette, St. Agathe, St. Flore, St. Thais, Stellata Globosa, Trophée, Uranie, Vicomte de Caumont, Vicomte de Macarthy, Zenobie.

The Nurseries, Tooting, London.

THE CHELTENHAM FLOOD.—A Subscription has been opened for the relief of the sufferers in the destructive flood which visited Cheltenham a few weeks since. This sad calamity has caused great loss and damage to Mr. C. H. Jessop, Mr. Hodges, Messrs. Jessop Brothers, and others. Greenhouses, Gardens, and Aviaries have all suffered more or less from the rush of waters in which they were, for five or six hours, completely submerged, and by which the most beautiful and valuable of their shrubs and plants were altogether destroyed. A great part of Mr. Jessop's Nursery was covered with 6 or 8 feet of water, and the damage done to the plants has been immense. In addition to about 270*l.* which has been subscribed in Cheltenham, the following gentlemen have handsomely come forward to the help of the sufferers:—

Messrs. Noble, Cooper, & Bolton, London ...	£10	10*s.*	0*d.*
„ Hurst & M'Mullen, London	5	0	0
„ Waterer & Godfrey, Woking ...	5	0	0
„ John Sutton & Sons, Reading ...	3	3	0
„ Peter Lawson & Son, Edinburgh ...	2	2	0
„ J. C. Wheeler & Son, Gloucester ...	2	2	0
„ John Palmer, Annan	2	2	0
„ John Waterer, Bagshot	2	2	0
„ Thomas Gibbs & Co., London ...	1	1	0
„ E. G. Henderson & Son, London ...	1	1	0
„ Moore & Son, Birmingham	1	0	0
„ Ward & Son, Bath	0	10	0

A further list will appear next week; in the meantime subscriptions will be thankfully received by Messrs. JACOB WRENCH & SONS, London Bridge; NOBLE, COOPER, & BOLTON, Fleet Street; WHEELER & SON, Gloucester; or A. PAUL, Esq., Cheltenham.

DUTCH BULBS AND FLOWER ROOTS.

THOMAS JACKSON AND SON respectfully inform their patrons and the public that they have received in the finest condition their annual consignment of Bulbs and Roots, and that they are of the largest size and very finest quality. Good Double Hyacinths 4*s.* per dozen; mixed Polyanthus Narcissus, 3*s.* per dozen; Double Roman Narcissus, 4*s.* per dozen. Their Priced List of Bulbs, &c., and also their General Priced Catalogue of Stove, Orchidaceous, Greenhouse Plants, Ornamental Shrubs and Trees, and Herbaceous Plants may be obtained on application.—Nurseries, Kingston, Surrey.

DUTCH ROOTS.

BASS AND BROWN beg to announce the arrival of their first Importation of DUTCH ROOTS for the present season. Their stock of Bulbs of imported and home growth is very select, among which will be found those of the finest sorts in cultivation, including their extensive assortment of Gladioli and other Cape Bulbs.

Imported DUTCH HYACINTHS, with printed instructions for their culture:—

50 varieties in 50 choice sorts	30*s.*
25 varieties in 25 do. do.	16*s.*
Best named varieties, per dozen ... ... 6*s.*, 9*s.*, and	15*s.*
Separate colours without name, per dozen	3*s.*

If required for forcing, we particularly recommend early planting.

The BULB LIST is now ready and may be had on application, and the whole of the Autumn Catalogue will shortly be completed.

Seed and Horticultural Establishment, Sudbury, Suffolk.—September 15.

BROWICK RED WHEAT.—SEED WHEAT of the above description, and true, may be obtained immediately by addressing Mr. EDWARD BALL, Bailiff, Post Office, Beaconsfield. Price, by quarter or sack, 10*s.* per bushel. All orders to be accompanied by a Post Office order in remittance.

WARD'S OMAR PACHA STRAWBERRY.

WILLIAM JAMES WARD offers the above handsome fine flavoured Strawberry at the following reduced price:—100 plants, 1*l.*; 50 plants, 12*s.*; 25 plants, 7*s.*, strong and well rooted. In addition to the many flattering testimonials received last season, Dr. LINDLEY describes it as being exhibited at Chiswick, July 11, 1855.—"*Excellent in quality as well as attractive in appearance.*" See *Gardeners' Chronicle,* Leading article, July 14, 1855. The Editor of the "Florist and Fruitist," in the August Number report of the Exhibition at Chiswick, says—"WARD'S *Omar Pacha is a new Strawberry, and considering its high flavour and comparative hardiness is a valuable acquisition.*"

A few last year's plants 5*s.* per dozen.

Prospect Hill, Reading, Berks.

SPLENDID SPECIMEN GREENHOUSE PLANTS.

WILLIAM BARNES is commissioned by a private gentleman to offer for sale some of the finest specimens in the country of the following kinds of Greenhouse Plants:—

Azalea delicata	Erica vestita alba
„ variegata	Epacris miniata
„ Lawrenceana	Pimelea decussata
„ Gledstanesi	Pultenæa stipularis
Chorozema angustifolium	Polygala acuminata

Particulars can be obtained by application to
WILLIAM BARNES, Camden Nursery, Camberwell.

RARE BRITISH FERNS.

JAMES BACKHOUSE AND SON can now offer nice Plants of the rare PSEUD-ATHYRIUM FLEXILE, from the Clova Mountains, Forfarshire, discovered by themselves in 1852, at ... ... 21*s.* 0*d.* each

PSEUD-ATHYRIUM (Polypodium) ALPESTRE	5*s.* 0*d.*	„
WOODSIA ILVENSIS,* 5*s.* each, extra strong	7*s.* 6*d.*	„
LASTRÆA RIGIDA	2*s.* 6*d.*	„
CYSTOPTERIS DICKIEANA	3*s.* 6*d.*	„
POLYSTICHUM LONCHITIS	3*s.* 6*d.*	„
CYSTOPTERIS MONTANA	10*s.* 6*d.*	„
Ditto ditto a few extra strong	21*s.* 0*d.*	„

*Though a British species, the roots offered are Norwegian.

York Nurseries, Sept. 15.

VARIETIES OF BRITISH FERNS.

ROBERT SIM begs to offer fine plants, in luxuriant health, suitable for hardy Fernery or pot culture, of the following perfectly distinct, elegant, and scarce varieties, selected from his catalogue, which see for description.

Asplenium Trichomanes var. cristatum	2*s.*	6*d.*
Athyrium f. fœmina var. multifidum	5	0
Lastrea filix-mas var. cristatum	2	6
Polystichum angulare var. proliferum	3	6
Scolopendrium vulgare var. digitatum	3	6
„ „ var. Endiviæfolium ...	2	6
„ „ var. multiforme	5	0

Carriage paid to London. Post-office orders on Chislehurst.

Nursery, Foot's Cray, Kent.

The Gardeners' Chronicle.

SATURDAY, SEPTEMBER 15, 1855.

THOSE who wish to see the effects of skilful cultivation should now visit the ORCHARD HOUSE in the Garden of the Horticultural Society. They will there learn how to estimate at their true value the assertions put forth by gardeners who have either wanted the practical knowledge demanded by this sort of cultivation, or who, *more atavorum,* proceeded without ceremony to condemn what they had no experience about, for the sagacious reason that it was new and of no use.

Since Mr. RIVERS directed attention to this interesting kind of gardening it has been imitated in many places; a few old sashes, some posts, and weatherboarding being all that is absolutely required to carry out the experiment. That many succeeded, if others failed, has been shown by the extension of the practice, and by the significant fact that the preparation of fruit trees for orchard houses has already begun to become a trade. Nevertheless, we have been assured that growing fruit trees in orchard houses would never succeed. Some said that the fruit would never set, or if it did, that it would not stone, or if it got past that critical period of life it would never swell, or if it did swell it would crack. One man cried out—"Mildew;" another "red spider;" a third hinted "expense;" a fourth muttered—"a fine deal of trouble this will be." Nor can it be denied that cases occurred to which

an appeal might be made in support of all such objections.

Luckily, however, there were cases of another kind, in which appeared neither mildew, nor red spider, nor shrivelling, nor any of the evils that had been predicted. Small trees in pots loaded with fruit were seen at exhibitions; Stanwick Nectarines reached their natural excellence; and Pears, Plums, and Peaches ripened here and there most beautifully. And so the experiment continued to make progress.

In the autumn of last year the Rose-house in the Garden of the Horticultural Society, which had been found unsuitable to its original purpose, came under the management of Mr. Gordon. In November and December a variety of young fruit trees were placed in pots from 12 to 14 inches in diameter, for the service of this house; and as many as it would hold were collected in it. Not quite 10 months have elapsed, and a result, which we think remarkably satisfactory, has been obtained. The house is span-roofed, between 50 and 60 feet long, has half its sashes sliding down, and the others fixed; and there is additional ventilation through doors which fall down in the wooden sides. Artificial heat there is none. The centre is occupied by a raised flat bed, and near the sides is a similar bed, on which the pots are placed. Nothing can be more simple. A hundred and eight pots of one kind or other are now standing in it.

During the whole season, from the first week in May to the present day, this house has produced a succession of fruit. First came Strawberries, abundant and excellent, which strange to say did not require to be perched up just under the glass, in the most approved manner, but were borne by strong healthy plants standing on the side borders 4 or 5 feet from the glass; but then, whenever the door and side ventilators were opened air blew freely over them. These were followed by Gooseberries, Raspberries, Currants red and black, and Apricots; Peaches, Nectarines, and Plums are now ripe, to be succeeded by Pears, and in another year by Figs and Grapes. It is impossible for trees, under any circumstances whatever, to be in more robust health. Their leaves are the deepest green, their wood firm and short jointed, their skin as clean as if they had been duly washed every morning, and the fruit itself well swelled, beautifully coloured, and perfect in flavour. Even the little Kai-sha, the best and ugliest of Apricots, gained all its Syrian excellence in this place.

The fruits now ripening consist wholly of Peaches, Nectarines, Plums, and Pears. Some idea of the appearance of the House last Monday may be gathered from the following enumeration of the more striking specimens:—

Peaches.

Violette Hâtive; six on one plant and three on another.
Early York; three.
Royal George; nine.
Grande pourprée hâtive; five.
Grosse Mignonne; three.
A late seedling; fourteen.
Admirable Jaune; seven.
Acton Scott; thirteen.
Mercaton (?) hâtif; three.
Early grosse mignonne; seven.
Chancellor; seventeen.
Monstrueuse de Douay; three.

Nectarines.

Violette hâtive; seventeen on each of two plants, and nine on a third.
Stanwick; six.
Elruge; six.
Pitmaston Orange; six.
Orange précoce; three.
Fairchild's; twenty-one.

Pears.

Passé Colmar doré; eight.
Triomphe de Jodoigne; six.
Charlotte Beurré; seventeen.
Beurré gris d'hiver nouveau; six.
Doyenné Goubault; seven—beauties.
Beurré d'Anjou; four.

Plums.

Denniston's superb; forty-eight.
Huling's superb: a most excellent, large, and handsome green table kind; twenty-four.
Reine Claude de Bavay; ninety-six.
A late Plum without a name; ninety-six.

Such specimens as some of the Plums, two of the Violette hâtive Nectarines, the Acton Scott Peach, and the Fairchild's Nectarine were perfect; and yet it must be remembered that it is hardly ten months since the trees were presented to the Society by Messrs. Lee, of Hammersmith, and Mr. Rivers, of Sawbridgeworth. Another year, with more age, will doubtless witness even a greater result.

The possibility of obtaining immediately and with certainty an abundance of fine fruit in an Orchard House has been thus demonstrated. There is nothing wonderful in the arrangements of the house in question, or in its glass, or its ventilation. In some respects it certainly might be improved. Nor need such a plan be made with the good workmanship employed at Chiswick. A very rough arrangement would answer just as well. The first cost is therefore the least which it is possible to conceive where wood and glass are to be used.

The purchase of plants can be calculated by any one; their price will, of course, depend upon their age and previous management in the nursery. The rest consists of pots, earth, labour, and skill. Is it worth while to apply these to a kind of cultivation, the effect of which is to produce certain and large crops of fine fruit upon little trees, many of which would in fact be magnificent decorations of a dinner table? Most people will reply in the affirmative, for we know of no piece of luxury more cheaply purchased.

"Being last month," writes a correspondent, "on a visit to a place in Warwickshire which has a remarkably fine avenue of old Scotch Firs (which a few years since appeared in perfect health), I was shocked to see some dead and the rest apparently dying. The proprietor informed me that he had observed the ground strewed with the young shoots, and had attributed this to the wind and the squirrels. Upon closer examination he had detected in the severed shoots a small black beetle, which eats its way up the young wood, leaving its white perforated road easily discernible. Upon my return home, I anxiously inspected some old Scotch Firs of my own, which I highly prize, and was well pleased to observe their seemingly sound condition. This morning, for the first time, I found a number of the new shoots scattered on the ground. The enemy has invaded them. What is to be done? Is it a new infliction, or one of which there is previous experience? If the latter, there may be some known remedy. You would much oblige me by imparting any knowledge you may have on the subject, and by advising the measures most likely to save my trees."

We wish to draw attention to this case, in the hope that some one may be able to mention a remedy for what has hitherto been found irremediable. The injury complained of by our correspondent is caused by the attacks of the *Hylurgus piniperda*, or little black Pine beetle, one of the most destructive pests in plantations. We have seen thousands of young plants of the common Scotch Fir ruined by this insect in the open quarters of nurseries, and the practised eye detects its presence in all directions among older trees. In a former volume Mr. Curtis gave a figure which we reproduce, since it shows what the offender is like and how he works.

At fig. 3 he is represented of his natural size, and at fig. 4 much magnified; *e f* and *g* are his jaws and feelers, and figs. 1 and 2 show how the twigs that

he attacks are pierced. In the early summer, when the wood is tender and succulent, he alights at the base of a young shoot where he soon effects an entrance (fig. 2, *c*); thence he works upwards, devouring the pith and killing the shoot. Now it is to be remarked that the Hylurgus does not act thus for the sake of finding a place in which to lay its eggs, but is actuated by the pure and simple motive of hunger. It is therefore useless to search in the young shoots for the eggs, since none are there. We are assured by entomologists that the eggs are hatched *below the old cracked bark*, where the maggot, a fleshy, dumpy, yellow-headed fellow, like that of a Hazel nut, feeds on the soft inner bark. It is there, we presume, that the insect undergoes its transformations, and where it hatches in the warm days of spring. As soon as it finds its way out of the hole it is born in, it alights on old pales and Fir trees, basks in the sunshine, pairs, lays more eggs in the old bark, and then, having done what it was born for, proceeds to enjoy itself, like a true epicure, by selecting the tenderest morsels within its reach.

Such being the way of life in which Hylurgus indulges, it is evidently no easy thing to stop his proceedings. To catch him on the wing, in the early spring, would be the right way, but how to do it? and where to find him? To scrape bark down to the quick for the chance of picking out his maggots is to cure one mischief by producing more of another kind. To gather up dead twigs, and most especially to pull off *every dying shoot* as soon as it begins to change colour, and immediately to burn them on the spot has been suggested as a practicable remedy. But the misfortune is that the eggs of a new brood will have been already laid, and that the insects burnt are only the exhausted individuals which would probably have died in a few weeks. How this may really be, however, is we think not conclusively made out by entomologists; and we venture to entreat their renewed attention to the subject. The question is one of some natural history interest, as well as of practical importance, and science cannot do better than lay aside classification for the moment in order to take up natural œconomy.

Last week mention was made of a very singular sporting Gooseberry, to be seen in Mr. Telfer's garden, near Glasgow. Since that time we have been favoured with some of the fruit; and we can confirm the statement. Seventeen berries reached us; of these six were red and hairy, three were red, smaller, and smooth, one was green and seven were yellowish tinged with buff. Both the green and yellows were furnished with *crimson seeds surrounded by crimson pulp*. It would be very interesting to trace, if possible, the history of the bush, and to ascertain whether its seedlings have any such constitutional tendency. We cannot call to mind an exactly parallel case.

New Plants.

143. Pinus Royleana, *Jamieson in Journ. of Hort. Soc.*, ix. 52. *Carrière conif. p.* 399.

This plant was published in the Journal of the Horticultural Society, upon the authority of Dr. Jamieson, superintendent of the East India Company's Botanic Garden, Saharunpur, as a native of Nepal, where it forms "a noble tree growing at an altitude of 8—10,000 feet." The name sent with it by Dr. Jamieson was preserved, and its distinctness *as an Indian Pine* recognised; for "previously we had no Pine from India with only two leaves in a sheath, and very small cones."* The appearance of the seedlings seemed to confirm the opinion, for they bore no resemblance to any Indian Pine.

When however the statement from Saharunpur became known to Drs. Hooker and Thomson these distinguished botanists, so familiar with the vegetation of N. India, at once expressed doubt about the accuracy of the information furnished to Dr. Jamieson; their experience of native collectors led them to question whether the tree grew in Nepal at all, and to suggest that the cones and seeds which had been sent to England might very probably have been gathered in some garden.

It turns out that these doubts were perfectly well founded, at least in part; for the second year's growth of the seedlings has enabled Mr. Gordon, whose practical acquaintance with Coniferous plants is unrivalled, to ascertain beyond all doubt that the so-called Nepal *Pinus Royleana* is no other than the New Jersey Pine of the United States (*Pinus inops*). We have ourselves verified the exactness of the identification. So much for Indian collectors.

It should, however, be remarked that this same *Pinus inops* also exists in cultivation here under another name—that of *P. intermedia*, given it by the late Dr. Fischer, of St. Petersburgh, who sent the seeds to this country. A plant so called, and so obtained, is now growing in the garden of the Horticultural Society, where Mr. Gordon long ago identified it with *Pinus inops*. Whence did the Russians procure this *Pinus intermedia*?

LANDSCAPE GARDENING.

(*From Turner's Florist, Fruitist, and Garden Miscellany*).

In the course of our professional journeyings immediately round about the metropolis, it has been a matter of surprise to us that the gardens of villas, large and small, exhibit in their arrangement less good taste than those of similar dimensions in provincial districts. Not that this has been the result of accident; for they almost invariably boast of a large amount of laying out, and not uncommonly is it their misfortune to have too much of it, in that an attempt is made to accommodate within a small space a certain quantity of all the different ingredients which go to the making up of a large garden; and these are obtruded upon each other in such admired discord that a visitor is inclined to compare the *tout ensemble* to a marine store shop of odds and ends of gardens. We have frequently seen, within the space of half an acre or so, geometrical arrangements, sweeps of shrubbery, herbaceous borders, serpentine walks, arbours of different kinds and patterns, with stone vases and statues scattered about upon the ground or mounted

* M. Carrière, in his work on Coniferous plants, in translating the passage within inverted commas, omits the words *from India*, and thus makes Dr. Lindley say that we had previously had no Pine with only two leaves in a sheath and very small cones; which would have been absurd. We trust that M. Carrière has been more exact in other parts of his work.

upon picturesque old stumps; finally, no garden of the kind is considered complete without its fountain, rockwork, and lake.

These various items are crowded together in so small a space, that from the windows of the house they are all under the eye at the same time; and care has generally been taken, for the sake of contrast, that the parts least in harmony with each other should be placed most closely in juxtaposition.

It is only confusion and disorder we would be understood as objecting to, not variety. The exhibition of skill in arranging a garden consists not only in the careful adaptation of the parts to their proper effects and purposes, but also in arranging their order with reference to each other, so that they shall combinedly form a harmonious whole; and these points duly kept in view, as much variety should be introduced as the space admits of without crowding.

As examples are more illustrative than a long dry discourse, we have selected a case in point from amongst those which have come under our consideration, and give engravings by which we can render more intelligibly an idea of what the garden was and of what it is now.

The house is pleasantly situated in one of our suburban villages, having its entrance towards the public road, and looking from the garden side over a flat agricultural scene, with which the house stands too much on a level. In front of the house a respectable piece of garden extends itself, flanked by a shrubbery on both sides, and bounded by a pond between and the extended meadows beyond. On the right is the greenhouse, at the end of one of the offices, inconsiderately placed so close to the garden as to make it an impossibility to conceal it by planting without materially encroaching upon the ground. Further to the right stand coach-house, stables, and other offices, and beyond these a large kitchen garden.

The house itself is of plain red brick, unpretending in its architecture, and of a description which would require considerable outlay to give it a degree of ornamentation. The drawing-room, ending with a large bow on the left hand side of the group, being the only important room on that side of the house, it rendered the arrangement of the garden difficult; this, however, had been managed without the slightest reference to any windows of the house or in any other way with regard to it. The ground was simply cut longitudinally by a walk somewhere about the middle, and across again about half way in the other direction, and, strangely enough, without any regard to right angles; and where these two lines intersected a fountain was introduced—other walks were made on each side of the garden, on one side a straight one, and on the other an example of the serpentine, and were joined at each end by other irregular ones; two arbours were added with as little regard to symmetry as possible, and an arrangement of clumps containing large shrubs crossed the end of the garden, completely shutting out the view of the meadow, and diminishing the prospect of the distant country. Near the centre of each compartment of turf was a peculiarly unplantable bed, with four long points, having a shrub in the centre, and intended to contain half-hardy plants, &c. The outer borders were all bounded with Box-edgings, and contained mixtures of common flowers and shrubs. Bits of rockwork, shellwork, and old blocks and stumps were scattered about, and generally these specimens of the grotesque were surmounted with a vase or statuette.

The great faults in this case were the shutting out of the extended prospect, the cutting up of the garden into small patches, and the complete exposure of all the walks as though they were the most important features of the garden. The first of these was rectified by clearing away the clumps near the pond, the second by

ORIGINAL PLAN.

IMPROVED PLAN.

destroying the centre walk, and the third by fringing the broad turf plot so obtained with clumps for flowering and other shrubs of moderate growth, which would rectify the obtrusiveness of the side walks, and be subservient to the larger shrubs beyond them.

In the new arrangement a centre was obtained upon a line from the fountain, at right angles with the building; and to give a balance to the basis of operations, a large projecting mass of close-clipped evergreen was introduced, to correspond with shape of drawing-room bow, which also served to aid in concealing the offices and yard on the right hand side of the house, and the yard itself was considerably contracted, that it might be effectually planted out on both sides from the garden.

Parallel with this centre line, and equidistant from it, the two side walks were laid down, and the use of Box edging confined to the right hand side, where double lines are shown, and where it was most in keeping from its contiguity to the greenhouse; on the left hand side turf was used up to the shrubs, which were pegged down to meet it and conceal the margin. The two side walks were curved round so as to meet each other near the pond, which was made less artificial in outline, and rendered a more endurable object from wherever it could be seen. From these walks a branch was made to lead to the summer-house and meadow wicket on one side, and on the other side towards the kitchen garden. The branch walk leading to the back of the greenhouse was so curved as to render it less obvious, and in a circle of gravel, as shown, was placed, upon a suitable pedestal, one of the best of the statues—one we found stuck up in the fork of an old Mulberry tree; and on the opposite side of the garden a corresponding niche was made for its companion. The other architectural embellishments, in the shape of vases, were furnished with proper pedestals, and appointed to suitable positions as near the mansion as possible.

We deemed that the house itself and the laundry could be most economically improved in appearance by covering them entirely with creepers, and especially with evergreen Roses, Pyracanthas, variegated and other ornamental Ivies, and the like, with a due admixture of Clematis, Honeysuckle, Wistaria, &c.

As the greenhouse and frame accommodation was limited, we were not justified in proposing a very extensive parterre, even if the extent of the ground warranted it; its natural flatness, however, suggested the propriety of a certain quantity of such arrangement, and it was obviously important that such feature should be as near the house as possible.

The apparent breadth of the garden, and indeed its general extent, being so much increased by these arrangements, the four beds *c e e e* were introduced on one side, in line with centre of drawing-room window, and in a corresponding position upon the other. It is admissible that these should be filled either with dwarf flowering shrubs or with half-hardy plants, annuals, according to convenience, &c. A Swedish Juniper has a satisfactory effect in the centre of each.

So much more having been made of the ground in front, it became a reasonable matter to have nothing but shrubs and turf on that side of the house, and arrange that carriages might come quite up to the front door, instead of unloading at the wicket gate against the road in all weathers. Other matters are, we consider, so fully explained by a comparison of the two plans, and the reference thereto, that it will be needless to lengthen the article with further description.

VEGETABLE PATHOLOGY.—No. LXXXVIII.

364. Carcinodes * (Canker).—The word canker is used popularly to designate several diseases which are essentially distinct. It is applied, in fact, to all cases in which the branches or parts of them become covered with unsightly depressions or excrescences leading more or less speedily to death. There is, however, the greater need to distinguish between them, because there is a possibility of confounding in the same tree affections which may be either constitutional or caused directly by the attack of insects, and where the treatment is consequently altogether different. Nothing, for instance, is more common than for Apple trees to be covered with rugged, depressed, ulcer-like spots, penetrating to the base of the bark and denuding the wood, to the ultimate destruction of every part on which they appear. These spots, however, are not constitutional, but are caused by the irritation consequent on the presence of the woolly aphis, commonly known under the name of the American blight. If proper measures be taken to destroy and prevent the spreading of the insect, though the parts already affected cannot be thoroughly cured, the new shoots will be clear. There is, however, another affection of somewhat similar appearance which is altogether constitutional, and therefore cannot be entirely suppressed, though injurious consequences may be warded off by timely excision of the parts affected. New branches will not, indeed, be exempt from attack, as in the case just indicated.

365. It was mentioned above that many trees have a tendency to throw out roots from their bark, where moisture is purposely or accidentally applied, where the natural perspiration is prevented by the intervention of any thick substance in contact with it, or where the sap stagnates in more than usual abundance by mere gravitation. The roots which appear so often on Vine branches, or where felt is in contact with the smooth bark of the Fig, are familiar examples. Such circumstances may be attended by no ulterior consequences, or they may induce disease where they are not considered indications of a morbid condition in themselves. In the common Laurel, for instance, nothing is more common than for branches to become cankered where roots have made their appearance. Had such spots been in contact with the ground, they would have increased and ramified, without any detriment to health, tending only to spread the tree over a wider surface; but where they are pushed forward into the air alone, their tips soon wither, decay commences, the bark separates, and the whole branch ultimately falls from the infection of contiguous tissues. Such roots are sometimes, however, protruded in very different positions, where there is no force of gravitation, and where they frequently lead to evil. A young Apple tree for instance may appear to be in the most perfectly healthy condition, fruitful spurs are abundantly produced, a sufficient quantity of fruit arrives at perfection, and all seems likely to be well for an indefinite period; when most unexpectedly, just above the scars of the leaves, which have now become immensely expanded on the smooth stems, little raised spots appear, which soon give rise to fascicles of short roots. The tips soon wither from lack of moisture, the adjacent and subjacent tissues change their colour from the oxydation of the contained chlorophyll, decay commences, and ultimately the trunk is covered with unsightly patches, which give admission to external moisture, afford a fit nidus for destructive larvæ, and in the end induce serious mischief. The wisest course is to cut out carefully the spots as soon as they appear, so that they may shortly be covered by healthy bark. If neglected, there can be little doubt about the ultimate consequences. Such spots, moreover, afford a ready hiding-place for the woolly aphis, and the blame is laid upon the insect, though the first attack was perfectly constitutional, and might have led to serious mischief without the agency of more than mere atmospheric causes. *M. J. B.*

* From καρκινος, a cancer; and ειδος, resemblance.

Home Correspondence.

Trees Transplanted at Gunnersbury Park.—Permit me, in reply to Mr. Barron's request, to furnish you with the names and heights of the trees moved by him and me respectively. Of these Mr. Barron transplanted Magnolia cordata, 22 feet; two M. grandiflora, 15 feet; one ditto, 12 feet; a Spanish Chesnut, 20 feet; Cupressus macrocarpa, 17 feet; ditto, 16 feet; Pinus cembra, 17 feet; ditto, 11 feet; Abies Douglasi (not the large one about which so much has been said), 16 feet; two Pinus insignis, 14 feet; Chinese Arborvitæ, 15 feet; a Chinese Juniper, 13 feet; Juniperus excelsa, 10 feet; Pinus excelsa, 12 feet; and two variegated Hollies, each 11 feet in height. The above constitute the whole of the trees operated on by Mr. Barron or his man. The following were moved by me, viz.:—Two Deodars, each 21 feet in height; one ditto, 16 feet; four ditto, each 15 feet; two ditto, 13 feet; two ditto, 12 feet; and one ditto, 10 feet; also Taxodium sempervirens, 11 feet; a Cryptomeria, 14 feet; and another, 15 feet; Araucaria imbricata, 13 feet; ditto, 11 feet; ditto, 10 feet; ditto, 9 feet; Pinus Pinsapo, 10 feet; P. macrocarpa, 11 feet; P. Ayacahuite, 8 feet; Buxus Balearica, 10 feet (and 20 feet in circumference); a Cork tree (Quercus suber), 10 feet: besides numbers of other trees, the mention of whose names would occupy too much of your space. From the above it will be seen that there was no "mistake" in my former statement to rectify, and that even the "major part of the *large* trees" was not transplanted by Mr. Barron, whose skill in tree moving I considered established; and this was the reason, and nothing else, why he was only made to "stand sponsor" for the large Douglas Fir, 45 feet in height, the only tree transplanted worthy of his name—an opinion in which I think most people will concur when I state that with the exception of it, the Spanish Chesnut, and the Magnolias, all the others were transplanted three years ago by means of a *common truck!* Nevertheless, such is the kind of trees for the removal of which Mr. Barron is disappointed he did not receive "a certain meed of praise!" Those transplanted by me had no such previous preparation to facilitate their removal as that just described; and all the Deodars, together with the largest Araucarias and others planted by me, were brought a distance of from 18 to 20 miles nearly two months later in the season than when Mr. Barron moved his trees; therefore, of course, diminishing my chance of success, yet, as Mr. B. himself admits, "all have done well." In taking leave of this subject I may add that I have not a word to say against Mr. Barron or his machine, which, by the way, is a very good one; and to do his man justice, he certainly did give me a "notion" how to work it—a piece of knowledge I regret to say I was unable to put into practice, as my trees were moved by a different apparatus. *William Forsyth, Gunnersbury Park.*

Dwarf Fruit Trees.—Are Apples and Pears on dwarf trees less hardy than on standards or espaliers? Your observations in the last Number on the hardy fruits at Chiswick show such to be the case this season. Do you suppose it generally will be so? *R. Varden, Seaford Grange, near Pershore.* [The coldest stratum of air is that next the ground. You can ascertain this by placing three thermometers, some cold bright night, one next the ground, one 6 feet above it, and another 6 or more feet higher. Therefore dwarf trees are most apt to lose their blossoms in very cold bright spring nights.]

Dioscorea Batatas.—Whether our friend "Yam" in writing down this Dioscorea is right or wrong yet remains to be seen. I have no great opinion of its ever being a substitute for or superseding the Potato, yet it may, when we become better acquainted with it, prove a useful auxilliary. "Mr. Yam" seems to have had very meagre success in his endeavours to cultivate this new root. I have only one, of which I will now give you a concise history. I received a small (very small) tuber from Paris in the spring of last year; I potted and started it in heat, and subsequently planted it out, not, to tell the truth, setting much store by it. The plant in the course of the summer and autumn got overrun by Cucumbers, and was forgotten. In autumn I took it up, when it had grown somewhat larger than my middle finger. It was placed in a pot of light, dry earth, and set on the bench in the potting-shed throughout the severe weather in winter. In spring it was started in heat, and when it had pushed some length, I raised a hillock at the corner of a border, turned it out and tied it to a stick about 3½ feet high. It has grown luxuriantly without any further care, the shoots hanging by the stick and twining round each other in wild confusion. What the root or tuber will be remains to be seen; but at present the plant is luxuriant. Since planting it out a pot of water when dry is all the care it has had. It may possibly not succeed in every description of soil; but ours is far from being any of the best. *Quercus.*

New Belgian Strawberry.—At page 739 of last year's *Chronicle* you noticed very favourably a new Belgian Strawberry called Délices d'Automne; shortly afterwards Mr. Verschaffelt, of Ghent, advertised it at the rate of six plants for 10*s*. I immediately ordered that quantity, and in due time received them. I potted them and placed them in a cool pit for the winter, and brought them gently forwards with a late crop of forced Strawberries. I planted them out in May on a south border, where they have made a great quantity of runners, but not a single blossom has as yet appeared. I shall, therefore, be glad to know if any of your correspondents who may have purchased and tried this variety has been more successful than myself. *S. B., Elton.*

To make Guava Jelly.—Have Guavas ready peeled by midday; put them whole into, say a 4-quart glazed jar; put the jar into an iron pot of boiling water, and as the Guavas sink, by the drawing of the juice, fill up with other Guavas. Keep a fire under the pot during the night. Next midday strain off the juice through linen; put it into a preserving pan; to each teacupfull of juice add a teacup of sugar, clayed sugar will do, refined preferable; just as the juice and sugar are well mixed and boiled up, take off the fire and carefully strain; clean the preserving pan, put again on the fire and constantly skim till it becomes of proper consistence, which you see by dropping a little on a plate from the ladle, immediately cooling and becoming hard. *J. Salmon, Jun., Goshen, St. Elizabeth, Jamaica, Aug.* 1.

Propagation of Gynerium argenteum, or Pampas Grass.—The hardiness of this Grass has been sufficiently tested, several large plants of it in the neighbourhood of London having withstood the sharp frost of last winter; it is, however, generally admitted to be difficult to propagate. There are few herbaceous plants capable of being propagated by division that do not grow freely, provided the division be effected after the parent plant has ceased flowering. This does not appear to be the case with the Gynerium. Two instances occurred last autumn in which the offsets were separated from the old plant a short time after the flowers of the latter had disappeared. The offsets were all rooted, and one lot was wintered in a cool frame; by being rooted, I of course mean that the offsets had pieces of root attached to them when they were potted. The compost in both instances consisted of peat and sand. The second lot was kept close under hand-glasses in the cutting house. Those wintered in the frame all perished, and all but 5 out of 25 offsets which passed the winter under hand-glasses likewise died. In consequence of these failures I was induced to detach a few more offsets late this spring; I potted them as before, and placed them in a shady situation in the open air. These plants are now growing vigorously. *R. Miles, Bristol.*

The Laurustinus seeds so abundantly, and grows so freely from seed, that I think it is to be regretted that we content ourselves with taking advantage of its propensity for rooting at every joint, and constantly raise our supply of plants from layers or cuttings; and it must be in a great measure owing to this mode of propagation that we possess so few varieties of this much esteemed shrub. I have been led to offer these remarks from seeing a bed containing several thousands of seedlings, and a most interesting robust various-leaved group they presented. I found that they withstood the severity of the past winter, when thus only a few inches high, without even the assistance of that excellent protector snow. They consequently suggest the probability of belonging to a hardier race, and assure us of their being different in form by already assuming the perfectly upright pyramidal shape so generally the characteristic of the plant from seed. This alone, irrespective of the chance of a diversity of flower or foliage, would amply compensate for a little more trouble being paid to this subject than it has hitherto received. *J. M., Folkestone.*

Transplanting Machines.—I observe with satisfaction and regret the discussion which has commenced in your Paper on this subject, which appears calculated to lead to the comparative value of the various machines for the purpose which, within the last four years, have been brought before the public; with satisfaction because a good honest conclusion thereupon is of importance to proprietors of estates generally, and to professional men in particular; with regret because it is mixed up with an expression of feeling displaying acerbity of manner, and which in all cases is liable to lead to recrimination. Cannot such matters be managed with a simple reference to facts? It would be more creditable to all parties. I must express my regret that a gentleman of Mr. Barron's well known high standing in regard to personal character and professional ability, should in the third person have "slashed" so pointedly at your favourable report of Mr. M'Glashen's apparatus and experiments a few years since; and have attributed the manner of the report of Gunnersbury to neglect of his merits, or an intention to underrate them, or cast or leave them in the shade. I think no candid man, on reading the said report, would have seen in it a sufficient call for Mr. Barron's sharp rebuke; and if he felt that omissions or inaccuracies existed in it, a simple rectification of them would, I am sure, have received all due and respectful attention from you, and have been perfectly satisfactory to your readers. I cannot, moreover, see in "Observer's" letter any sufficient cause for Mr. Barron's manner in his reply thereon. I considered the suggestions of "Observer" very valuable, and if they can be acted upon they would tend much to give each machine its fair place in the eyes of the public. As your Paper is so extensively circulated amongst landed proprietors, perhaps some of those who desire to have large trees moved would allow a fair competition of the kind to be carried out upon their property, and I would move an amendment to the suggestion that, if possible, several experiments be made on different soils, giving the competitors also any choice of time and season, with liberty to make such preliminary preparations as they deemed necessary, within twelve months of the arrangement being made. As to terms I would suggest that the proprietors should defray the usual charges of the operators; that the public might be made acquainted with the comparative expense as well as with the result; and further that perfect fairness may be insured, the operations should be watched by a committee of professional men to which each competitor should name a member; and the proprietors of the several estates on which the experiments were conducted should also be on the committee themselves or name a deputy; and with yourself as chairman. I hope Mr. Barron will believe that I have no interested motive in recommending this course save that of obtaining conclusive information; and I offer the suggestion as one by which he may have fair play, but no favour. I believe Mr. Barron desires no more. *William Davidson, Landscape Gardener, 36, Great Russell Street, Bedford Square, London.*

Cattleya Mossiæ.—I have this with three seed pods on it, each more than an inch in diameter. The plant had 16 flowers all expanded upon it at one time, and in order to keep it in perfection as long as possible, I had it suspended in a shady corner of an airy greenhouse. There were at the time quantities of humble and other bees working amongst the greenhouse flowers, and to these I attribute its having been fertilised and set for seed. I have flowered this Cattleya some years along with others, but I never got one to seed before. From the description given of one shown in June last from Sion I judge mine to be the same variety; it has very large flowers; one which I measured was 8 inches across, and it had the deepest-coloured purple blotches or markings on the lip which I ever saw on any of the

many varieties belonging to this genus. *W. Hopps, Lightcliffe, Halifax.*

Which is the best Season for Transplanting?—I can bear testimony to the remarks of Mr. Scott on the perfect safety of lifting all kinds of trees in summer. I have done so from choice, and sometimes from necessity. I ventured on the experiment from supposing that if gardeners can conduct many transplanting operations in the flower, kitchen, and forcing garden with success, why not shrubs and trees. Various causes will always operate against the plan being much adopted, but as to its success when done properly there can be no doubt whatever. *Observer.*

Galvanised Wire.—Several statements have appeared in your columns respecting the bad effects of employing this wire in the formation of lattice work, or espaliers for plants, and more especially for fruit trees. Now as this kind of wire possesses great recommendation for such purposes, being rendered extremely durable, and no disturbance of the plants for the purpose of painting (as the continual expense of such an appliance is unnecessary) being required, I think it important that we should know how far the serious charges brought against it are founded on fact, and I must say that so far as my own experience goes I have found them to be entirely groundless. This opinion has been much strengthened by an examination made this day of an entire garden so espaliered, on the estate of the Hon. J. D. Bligh, at Sandgate, on the whole of which there is no instance of any blight or canker whatsoever, and finer grown trees for the time they have been planted (some five or six years), it is impossible to imagine. No doubt plenty of cankered and diseased trees are to be found upon galvanised trellising, I have no intention of saying that it will prevent such evils; but the great fact that trees do grow so admirably upon it proves that it possesses nothing to engender them, and I know that others can bring forward evidence to the same effect. *J. M., Folkestone.*

Notices of Books.

A System of Botanical Geography. Géographie Botanique Raisonnee. By Alph. De Candolle. 2 vols. 8vo. Paris. Masson.

Under this title we have a long-looked-for desideratum in botanical science, a book embodying the principles of the study of the geography of plants, skilfully planned and conscientiously executed. M. Alph. De Candolle, son of the late distinguished systematist, has, it is well known, been devoting his energies and ability to the preparation of an elaborate work on this subject; and as he is also known to possess attainments and facilities for its successful completion which few or no other naturalists do, the result is, as was to be anticipated, in every way worthy of the great name he bears.

The work itself is a very full one, consisting of two thick octavo volumes, with 1300 pages of closely printed matter. It is, of course, addressed chiefly to botanists and physicists, and it is written in French, with admirable clearness and logical precision of style and diction. That it will soon be translated into English cannot be doubted, and it will then command the attention of every lover of science; as, however, the direct application of its principles to horticulture and gardening ought at once to be laid before the English public, we shall devote a few articles to a summary of these, as illustrated by the contents of the work.

Few naturalists are, perhaps, fully aware of the wide range of preliminary acquirements necessary to the study of botanical geography; the nature and amount of these, together with the length of time which has elapsed since the publication of any good general treatise on this subject, have combined to render the task of systematising it one of the most difficult philosophical problems of the day.

Since the publication of Humboldt's "Essai sur la Géographie des Plantes," in 1805, and Brown's Appendixes to "Flinders' Voyage to Australia," and Tuckey's "Voyage to the Congo," little had been done up to Schouw's time towards combining all into a general whole, and deducing laws from the result, and the additional materials now accessible from the countries whose vegetation was explored by Humboldt and Brown, have demanded the complete revision of their labours, previous to their incorporation with those of their successors, by the author of the work now under consideration.

During the thirty years which have intervened between the publication of Schouw's "Pflanzen Geographie" (Geography of Plants) and the present time, facts have been accumulating with unprecedented rapidity, but, with the exception of the elder De Candolle's, Watson's and the late E. Forbes's admirable efforts, there have been few extended attempts to classify and arrange them. Since Botany was first systematised by Linnæus, a multitude of local "Floras" have been published, with prefaces or appendixes (often of great value) detailing the distribution of species over areas more or less intruded upon by man; and a host of travellers, more or less skilled in Botany, in powers of observation, in geography, and in collecting materials, have illustrated their published travels with scattered notices of species and their ranges, or devoted chapters to a laborious tabulation of details, arranged geographically or systematically.

We have already alluded to M. De Candolle as possessing in an eminent degree the attainments necessary to a right understanding of the principles of botanical geography. These may be arranged under two classes—those that depend on a study of groups and species of plants in their several relations to one another, and those which are based on a study of plants in relation to the physical phenomena of geographical site, soil, climate, &c., under which they are found growing; hence arises the division of the whole subject into the two branches of Botanical geography and Geographical botany; the attempt to consider which under all aspects has often tended much to obscure both, and our author has done wisely to dwell upon them separately. Towards the elucidation of the physical problems M. De. Candolle has devoted many years of careful experiment and observation. He early directed his attention to physical geography, and was schooled in methods of applying it to the solution of botanical problems by his father, while, as he informs us, he had always a natural taste for arithmetical operations, and has published a valuable essay on the elevations of localities in the neighbourhood of Geneva, deduced from observations of his own as well as of others. He has besides himself investigated the influence of soil, temperature, and light on plants, experimentally and in the field, proposing and carrying out new plans of operation and new methods of working out their results. In pure botany too, M. De Candolle's attainments are of a high order, he has long been in the practice of studying in a most extensive and well arranged herbarium, has systematically elucidated several large and important natural families of plants, has studied in almost all the great European herbaria, has taught botany in its several branches, and has had the direction of one of the largest and best botanical gardens in Europe. When to these advantages are added that he has such a competent knowledge of French, English, and German, as to be able to read fluently in those languages the literature of these branches of science—that he combines great accuracy and industry with skill in the arrangement of his materials, a full appreciation of the labours of others, and an extensive correspondence with his fellow botanists everywhere—we shall have summed up the requirements for the task he has undertaken, and may safely affirm that no other naturalist can produce so many and such varied qualifications for its successful accomplishment.

In the preface to the first volume M. De Candolle alludes to many important points relating to the object and extent of the study of botanical geography, which have never before been treated in so able a manner, but which lie at the very threshold of the inquiry; he says that "the prevalent opinions as to its nature and limits are still very vague; these are too often regarded as comprised in the idea that it consists in the accumulation of innumerable facts relating to the relations between species and their habitats and localities: such a definition," he adds, "is far too general, and is inconsistent with the definitions given of other branches of botany. Thus organography is not the description of all organs of all plants, but has for its object the development of general laws from a study of the organs of a few well selected types. A treatise on vegetable physiology is in like manner based on the examination of a very few species; and so in botanical geography a vast number of isolated facts must be eliminated, and the attention devoted to such few as have the most general interest.

Having acquired a competent knowledge of what had been done by his predecessors, and prepared his own data, the difficulty of so arranging his materials as to deduce general laws from them seems to have delayed M. De Candolle's progress during many years of anxious thought and study. Thus, with regard to the influence of temperature, he truly states that it has long been a problem whether it is the mean or the sum or the extremes of the given temperatures that most influence the plant. M. Boussingault he considers to have first approached a solution of the problem, by his experiments on cultivated plants, extending which, and applying them to wild ones, has gradually led M. De Candolle to results which will hereafter be detailed, and which he thinks indicate general laws. The influence of light has in like manner been all along recognised but never defined; a study of its effects upon special examples conjointly with those of temperature has led him to regard their combined effects as limiting the distribution of species towards the north, and in their ascent of mountains.

Another class of facts for whose explanation no satisfactory theory had for many years been proposed is that which relates to the extension and limitation of species—why one species should be local and another cosmopolitan. The effects of climate and the relative facilities with which species propagate will not account for it, for many an exotic transported artificially to another country becomes even more abundant in the latter than it was in its native locality. To these problems M. De Candolle saw no solution till geology opened up a new path for investigation, and proved that we are not to look to existing causes or relations alone to account for the geographical distribution of existing species, these having often survived extensive changes in the relative positions of sea and land, and may not now exist where they were originally created.

From such points of view our author tells us that geographical botany ceases to be a dry accumulation of facts, and takes a high position as a scientific pursuit. Henceforward its main object is to show how far the present distribution of plants is explicable by the existing conditions of climate, or what must be attributed to anterior causes. The wide field of botany in connection with geology, or rather of the life of species in their relation to time, once entered upon, the mind is hurried on to regions of inquiry where all, in the present state of our knowledge, is impenetrably dark; referring to epochs antecedent to our own all data are incomplete; all facts are recognised only by halves, and are capable of the most opposite interpretations. We acknowledge the existence of a species on the face of the globe which we believe did not exist at what we assume is an immediately antecedent epoch, but our argument for its absence in the latter is a negative one, derived from the fact of its remains not having been found. On the other hand we have positive proof of species that are not living now having existed at previous epochs; and the sum of our evidence leads to the belief in a replacement of species. These subjects are ably handled in this work, and demand our especial attention at a future time; it will suffice to mention here, as theoretical data which must have influenced the author's treatment of the subject, however much he no doubt has striven to avoid it, that M. De Candolle believes existing species, in the ordinary acceptation of the term, to be definite creations, successively created, each at one spot only; but that all the individuals of each have not in all cases proceeded from one parent or pair only.

There is one other subject in the Preface to which allusion must be made, and upon which we venture to differ from our author; he justly prides himself upon not having introduced a single new term into his work, and for this he will have the cordial thanks of every well-wisher to botanical science. In the same desire to avoid confusion, he has adopted the scientific names of the species, genera, and families alluded to throughout his work in preference to their German, French, or English appellations; but whilst we agree with him entirely as to the necessity of using the Latin names, and the propriety of diffusing a knowledge of them, we can hardly agree with him in saying that amongst the uneducated classes the Latin name of a plant will be liked equally well with one in their native language, supposing both to be new and the choice offered. There is, it cannot be doubted, something in the sound and intonation of a native name that renders it more easy of retention by the memory, and more readily recalled and applied to the object when again encountered, than is the case with a foreign one; added to which, that it is often derived from some prominent peculiarity of the plant, or suggests some object of comparison or contrast. The instance quoted by M. De Candolle offers a case in point; he says, "Talk to an English operative of the plant called Nipple-wort, and you will find that he will appreciate the botanical one of Lampsana quite as much, and he will probably laugh at both, only because he has heard neither before." Now we will venture to say that for every ten uneducated persons who would remember the English name, not one would the Latin, for the obvious double reason, that the English suggests definite ideas (accurate or inaccurate it matters not), and the Latin none; added to which, the English word will bear much alteration without destroying its English sound, whilst it would be difficult to make the Latin one sound English by the change or transposition of the letters. We have had some experience in the relative facility with which new Latin and English words are acquired by children, who have no prejudice in favour of either, and can confidently state, though for the sake of science with much regret, that the preference with the uneducated classes will always be given to a vernacular name.

FLORICULTURE.

Royal South London Floricultural Society.—At the last exhibition of this Society for the season, lately held in Cremorne Gardens, the display of cut flowers was excellent, Dahlias of both classes being present in considerable numbers. Hollyhocks, both in the shape of spikes and cut blooms, Verbenas and miscellaneous collections were all shown, in first-rate condition, by growers from all parts of the country. In Dahlias, 24 varieties, the Rev. C. Fellows, of Shottesham Rectory, near Norwich, was first with Pre-eminent, Miss Caroline, General Faucher, Fanny Keynes, Rachel Rawlings, Robert Bruce, The Nigger, Mr. Seldon, Cossack, Bishop of Hereford, Annie Salter, Richard Cobden, Queen of Whites, Lemonade, Lilac King, Beauty of the Grove, Susan Sainsbury, Fame, Diadem, Malvina, Queen of Beauties, Sir F. Bathurst, Amazon, and Duchess of Kent; 2d, Mr. J. Robinson, Pimlico, with Duke of Wellington, Mrs. Seldon, M. Dugere, Admiral, Absolom, British Queen, Rachel Rawlings, Annie, Scarlet Gem, Sir F. Bathurst, Beauty of the Grove, Agincourt, Miss Caroline, Royal Sovereign, Triumphant, Sir C. Napier, Princess Radzwill, Cossack, Mr. Seldon, Louisa Glenny, Sir J. Franklin, and Rose Unique; 3d, Mr. Cooke, Notting Hill; 4th, John Sladden, Esq., Ash, near Sandwich; 5th, Mr. Maher, gr. to J. M. Strachan, Esq., Teddington Grove. For 12 varieties: George Holmes, Esq., Brook Lodge, Norwich, was first with 12 large and beautiful flowers. These consisted of Pre-eminent, Miss Caroline, Lord Palmerston, Fanny Keynes, The Nigger, Robert Bruce, Amazon, Advance, Sir J. Franklin, Sir F. Bathurst, Duke of Wellington; 2d, Mr. Pope, Chelsea, with Mrs. Seldon, Miguet, John Keynes, Amazon, Scarlet King, Absolom, Rachel Rawlings, Duchess of Kent, Princess Radzwill, Lilac King, Robert Bruce, Richard Cobden: 3d, Mr. Shrimpton, Thame, Oxon: 4th, Mr. Castles. Fancy varieties, 12 blooms, not more than two of a kind: 1st, Rev. C. Fellowes with Jonas, Triumph de Roubaix, Topsy, Baron Alderson, Flower of the Day, Triumphant, Duchess of Kent, Imperatrice Eugenie, and Miss Ward: 2d, Mr. Robinson, with Mrs. Hansard, Phæton, Jonas, Triumphant, Flora McIvor, Marvel, Butterfly, Miss Herbert, and Duchess of Kent: 3d, J. Sladden, Esq.; 4th, Mr. Maher. Nurserymen, 24 dissimilar blooms: 1st, Mr. Turner, of the Royal Nursery, Slough, with Bessie, Mr. Seldon, Triumphant, Robert Bruce, Pre-eminent, Rachel Rawlings, Miss Spears, Lollipop, Constancy, Sir R. Whittington, Miss Caroline, Cossack, Yellow Beauty, Duke of Wellington, Amazon, Miss Burdett Coutts, Duchess of Kent, Fearless, Annie, Annie Salter, Sir C. Napier, Lilac King, Empress, and Agincourt: 2d, Mr. Keynes, Salisbury, with Triumphant, Rachel Rawlings, Argo, Pre-eminent, Ruby Queen, Annie, Orange Perfection, Miss Caroline, Primrose Perfection, Dr. Reid, Sir J. Franklin, Colonel Baker, Lady Folkestone, Sir C. Napier, Malvina, Duchess of Kent, Lord Bath, Lilac King, Richard

Cobden, Robert Bruce, John Keynes, Annie Salter, Queen of Whites, Essex Triumph; 3d, Mr. Legg, Edmonton; 4th, Mr. Walker, Thame; 5th, Mr. C. E. Allen, Shacklewell. Fancy varieties, 24 blooms, not more than two of a kind: 1st, Mr. Keynes, with Triumph de Roubaix, Claudia, Lady Grenville, Elizabeth, Mrs. Hansard, Mrs. Willis, Emperor de Maroc, Duchess of Kent, Baron Alderson, Jonas, Marvel, La Tropique, Mrs. Spary, Princess Charlotte, Phæton, Pigeon, Comet; 2d, Mr. C. Turner, with Baron Alderson, Triumph de Roubaix, Emperor de Maroc, Marvel, Laura Lavington, Glorie de Kain, Admiration, Jonas, Mrs. Hansard, Comet, Flora M'Ivor, Pigeon, Butterfly, Duchess of Kent, Miss Frampton, Kossuth, Semiramis, Elizabeth, Attraction, Jenny Lind, Reine de Fleurs. Holly-Locks, spikes, 7 varieties: 1st, Mr. Grant, gr. to Robert Fellowes, Esq., Shottesham Park, with Pourpre de Tyre, Sulphur Queen, Eva, Elegans, Charles Turner, Solfaterre, and Brennus; 2d, — Benningfield, Esq., Brocksbourne, with Souvenir, Sulphur Queen, Mrs. Ashley, Joan of Arc, Eva, and Sir David Wedderburn; 3d, — Bower, Esq.; 4th, — Dyson, Esq., Stoke. Nurserymen: 1st, Mr. Chater, of Saffron Walden, with Empress, Salmonius, Sulphur Queen, Elegans, Mont Blanc, and two seedlings; 2d, Mr. Bircham, Hedenham, with Unique, Norfolk Hero, Duchess of Sutherland, Pourpre de Tyre, Eva, Lemonade, and Purple Perfection; 3d, Messrs. Paul, with tall fine spikes. 24 Cut Blooms, not more than two of each—Amateurs: 1st, Mr. Rooke, Clewer, with Eugenie, Julia, Emperor, Pourpre de Tyre, Mrs. Ashley, Souvenir, Miss Ashley, Lilac Model, Beauty of Cheshunt, and eight seedlings; 2d, — Benningfield, Esq.—the varieties in this collection dissimilar from the first were Pearl, Sulphur Queen, Emily, Sir D. Wedderburn, Eva, Comet, Joan of Arc, Lizzy, and Conspicua; 3d, Mr. J. Long, Watford; 4th, Mr. C. Grant. Nurserymen, 24 dissimilar varieties: 1st, Mr. Chater, with Fearless, Boule de Feu, Mrs. Ashley, James, Malvina, Empress (very fine), Mulberry Superb, Finella, Alpha (fine), Salmonius, Autocrat, Nitilina, Pourpre de Tyre, Walden Rival, Alexandrina, Julia, Golconda, Ochre (fine), Lilac Queen, Summit of Perfection, Mont Blanc, Walden Gem, Model, and a seedling; 2d, Mr. C. Turner. The varieties in this collection, which were fine, and not in the first, were Standard, Mrs. Parsons, Argo, Miss Parsons, Little Gem, Pilot, Orestes, Rosy Circle, Felicia, and Beauty of Cheshunt; 3d, Messrs. Paul and Son. Verbenas: 1st, Mr. G. Smith, Tollington Nursery, Hornsey, with Brilliant de Vaise, Viscount de Beleval, Empress, Lord Raglan, Joan of Arc, White Perfection, Sobraon, Morpha, Beauty, Madame de Lavalliere; 2d, Mr. J. August, Beddington. In Seedlings, Dahlias formed the principal feature. These were contributed in considerable numbers, some of which were marked improvements on existing varieties. For instance, there were two good yellows—Bessie, and Yellow Beauty, both superior flowers, there were 12 blooms of the former and six of the latter. Six blooms were also shown of Orange Perfection, a bright orange Dahlia of fine form; Miss Burdett Coutts, fawn colour, shaded; Lollipop, salmon; Eclipse, dark maroon, and shaded; Model, a flower with the same colours as General Faucher, but of good form. Three blooms were shown of Mrs. Wheeler, a glowing scarlet crimson flower of first-rate build; and Enchantress, a purple and white fancy variety, striped. This is a large flower, of good form. There were several other kinds exhibited, some of which possessed good points, but they were not in condition to form an accurate estimate of their merits. Those selected for First Class Certificates were:—Mrs. Wheeler, Bessie, Miss Burdett Coutts, Lollipop, Orange Perfection, and Enchantress. The same reward was also awarded to a new Phlox named Countess of Home, sent from Edinburgh. This is a light variety, and is a very pretty thing. Mr. Rooke received a First Class Certificate for his blush Hollyhock Perfection. This is a first-rate variety in form, but nothing particularly new in colour. Mr. Chater received similar awards for two kinds—Empress and Queen of the Buffs. These were large and attractive sorts. There were some very excellent new Verbenas: Criterion, Cremorne, and Mrs. Halford were selected as the best by the judges.

Calendar of Operations.

(For the ensuing week.)

PLANT DEPARTMENT.

Conservatory, &c.—It will hardly be safe to depend upon a continuance of fine weather after this time, therefore preparations should be made at once for protecting all plants of any value from heavy rains or slight frosts at night. Where there is proper accommodation for plants under glass there certainly is no propriety in keeping greenhouse stock out of doors as late in autumn as can be done without positive danger from frost, but in cases where many plants have to be wintered in Vineries it is often necessary to make every possible shift to keep the plants out of doors until the state of the Vines, &c., allows of managing the houses with something like regard to the well-being of the plants. And with the aid of skeleton frames or pits, constructed so that they will ward off a few degrees of frost, and a waterproof cloth, old sashes, or anything for covering that will throw off heavy rains, most greenhouse plants may be kept safely enough for some time yet, unless the weather should prove more unfavourable than ordinary, and will be found to do much better under such shelter than crowded too thickly together in the greenhouse, or in houses where fire-heat must be used. Indeed where plants have to be wintered under make-shift circumstances, as in forcing-houses, &c., which cannot always be had in a fit state for their reception at the proper time, some temporary shelter is indispensable to save the plants from drenching rains and cold winds in autumn; and a very suitable one would cost but little and would be found useful at most seasons of the year. But whatever arrangements may be deemed most advisable under individual circumstances should be seen to at once, as it will be very unsafe to leave the plants at the mercy of the weather much longer. Should heavy rains occur before the plants can be afforded any protection, be careful to prevent their getting too wet at the root. Luculias and other winter flowering things growing in the border of the conservatory must be freely exposed to light and air, in order to get the growth well matured and insure a fine display of bloom. Also see that all plants are clear of black thrips, for this pest is particularly active at this season wherever it is allowed to gain a footing, especially on Luculias and such things as are in a growing state. Stove.—Where there is but one house for the accommodation of the tropical plants, considerable care and attention are necessary to properly manage these at this season, as some having completed their season's growth require to be kept cool and rather dry, in order to ripen the wood, while others in free growth require to be encouraged with warmth and moisture. If there is no convenience for removing to a cooler house such things as have made their growth, these should be placed together at one end of the stove, keeping them sparingly supplied with water at the root, and giving air rather freely, which will generally serve to prevent any attempt at a second growth; and those requiring to be kept warm and moist should also be placed together at the opposite end of the house, where very little air should be given, using every care to keep the atmosphere about them moist, &c. Allamandas, Clerodendrons, &c., which have done blooming, may be removed to a Vinery where the Grapes are ripe or ripening, for as these will require very little water, they will not do much mischief in the way of causing damp, and their room in the stove will be found very useful for other things. See that everything is free from insects, and keep the foliage of such things as Ixoras, &c., clean by washing with a sponge and soapy water when necessary.

FORCING DEPARTMENT.

Pineries.—Take advantage of bright weather while it continues, to encourage free growth where this is desirable, giving the plants a liberal supply of water at the root, using manure water for such as are moderately well rooted, and keeping the atmosphere warm and moist. Shading will of course be dispensed with by this time—at least it should be, as growing plants will require exposure to all the light possible, in order to induce fine strong foliage and a dwarf stocky habit. See that the succession stock is properly supplied with water at the root, as any neglect in this respect while the weather continues bright would be liable to cause some of the plants to fruit prematurely. Also keep the atmosphere moist by frequently sprinkling the paths, &c., and syringe them lightly over-head, and shut up early in the afternoon, so as to husband the solar heat as much as possible: be careful, however, in syringing to spare plants in flower, as syringing these over-head would probably cause deformed fruit. Give plants swelling their fruit plenty of clear strong manure water, and young plants growing in open beds will enjoy an occasional soaking of the same. Vineries.—If bright weather continues, it will be advisable to shade fruit that is thoroughly ripe and expected to hang for a considerable time; for although the quality of the fruit may be rather improved by warmth, &c., some sorts soon lose their fresh plump appearance. Give air freely, and keep the house as cool and dry as circumstances will admit. Stop laterals in the late house, and keep the foliage regularly exposed to light, so as to have it as healthy and vigorous as possible. Fruit beginning to colour should be encouraged with plenty of warmth and air, as Grapes ripened during this fine weather will be very superior in quality, and more likely to hang well than such as have to be ripened by artificial means late in the season, when there will be comparatively little sunshine. Keep thrips in check where at all troublesome by repeated fumigations, and use every means to preserve the foliage from red spider. Vines planted this season, and which are growing freely, will probably be found to be getting too dry at the root; and where this is found to be the case, if it is desirable to encourage free growth for some time longer, give the border two or three slight waterings to moisten it about the surface roots, but by no means give it a soaking.

FLOWER GARDEN AND SHRUBBERIES.

That the present month is a favourable time for transplanting large sized shrubs and trees is seldom disputed by any person professing to possess any experience or knowledge of the subject; nevertheless, it annually happens that a great amount of this kind of work is put off until so late that the plants have no chance of pushing a few fresh roots to enable them to resist the cold drying winds of March: and there are doubtless many of our readers purposing to shift large shrubs and trees this season who have hardly thought of commencing yet; but we would strongly advise all such to start as soon as circumstances will admit, and they will find that things shifted during this month will require but little attention in the way of watering next spring and summer, compared with others transplanted in winter and spring. Also get ground intended to be planted with young things from the nursery turned up as soon as possible, especially in the case of strong adhesive soils, which are quite unfit for planting until they have been some considerable time exposed to the mellowing influence of the sun and air. Give diligent attention to the propagation of bedding out stock, and get cuttings that are sufficiently rooted potted off at once, keeping them close and moist until they become established. Those that have been potted off some time and have got established in their pots should be gradually inured to exposure to the open air, stopping the shoots to keep them dwarf and stocky. But plants that are not very strong should be shaded from bright sunshine for a few hours in the middle of the day, or placed in a shady situation out of doors; let them have the benefit of the night dews however if kept under glass, and guard them from cold drying winds if removed from under shelter. If any of the beds appears to be suffering from the want of water, give them a good soaking at once, and see that late Hollyhocks are afforded a liberal supply, which will greatly assist us in prolonging their beauty. We have already had some indications of the near approach of frosty nights, and it will be well to be prepared with something with which to cover any of the beds liable to be injured by slight frost, such as Heliotropes, &c., and the variegated Geraniums, the foliage of which is very readily injured by frost.

HARDY FRUIT AND KITCHEN GARDEN.

Any of the Peach or Nectarine trees which are observed to be growing too freely should be gone over, stopping all the stronger shoots, and those that were treated in this way a few weeks ago should also be looked over again, stopping a further portion of the shoots if this appears necessary, to prevent the formation of gross strong wood. Pear, and indeed, all trained fruit trees should also be gone over, removing all superfluous wood, so as to expose the trees to sun and air as fully as possible, which will be of service towards getting the fruit spurs and bearing wood well matured before winter. Where mulching has been used for Peach and Nectarine trees, this should be removed at once, if not already done, for the fruit seldom flavours well if the roots are excluded from the action of the sun and air during the period of ripening. See that Strawberries in pots for forcing next season are well cared for, placing them in an open sunny situation where they will have all the light possible, and do not allow them to suffer through the want of moisture at the root. Exhausted crops, as Peas, &c., should be cleared away as soon after they are done with as possible, and the ground manured and trenched, when it will be in readiness for planting with Cabbage, &c., and will look fresh and clean if not wanted for immediate planting. Tie up Endive to blanch, and plant out the late crop in a warm sheltered situation. Attend to Tomatoes, keeping the shoots closely stopped in order to prevent useless growth, and expose the fruit fully to the sun, for these are backward generally, and are hardly likely to ripen unless well exposed to the sun, &c.

STATE OF THE WEATHER AT CHISWICK, NEAR LONDON,
For the week ending Sept. 13, 1855, as observed at the Horticultural Gardens

The highest temperature during the above period occurred on the 17th, 1843—therm. 84 deg.; and the lowest on the 17th, 1840—therm. 29 deg.

Notices to Correspondents.

Crystallised Fruit: *J L F.* Beat the white of an egg to froth; dip your fruit in it; then roll it in white sifted sugar candy; when quite dry place the fruit in a stove to be very slowly dried. Or you may dry your fruit first, then dip it in white of egg, and then dust it with white sugar or sugar candy, finally drying it off.

Glass: *A D.* Hartley's patent rough plate will be found to answer your purpose best.‡

Grape Houses; *Cavanensis.* No doubt it is best for fruit houses to face the south—but the S.W. or S.E. will answer quite well if your gardener understands his business. Of course the proposed houses will not be overshadowed by trees, &c.

Insects: *A Novice.* The caterpillars which have attacked your Turnips are those of the common dart moth, Agrotis segetum (See *Gardeners' Chronicle*, 1852, p. 741, for figure and description). Salt and water or lime water applied to the roots of the plants will drive them away; but the surest plan is to pull up the infested roots and search for the grubs either in the bulb or adjacent earth. They must then be destroyed, or they will extend their ravages to the neighbouring plants, as they are not yet full grown. *W.*

Lawn: *A Subscriber.* If you will favour us with your address we will answer your inquiry privately.

Names of Plants: We have been so often obliged to reluctantly decline naming heaps of dried or other plants, that we venture to request our correspondents to recollect that we never have or could have undertaken an unlimited duty of this kind. Young gardeners, to whom these remarks more especially apply, should bear in mind that, before applying to us for assistance, they should exhaust their other means of gaining information. We cannot save them the trouble of examining and thinking for themselves; nor would it be desirable if we could. All we can do is to *help* them—and that most willingly. It is now requested that, in future, not more than four plants may be sent us at one time.—*T W P.* It is the bulbous variety of the Arrhenatherum avenaceum.—*N B.* 1 and 3, Lastrea dilatata; 2 and 4, Lastrea Filix-mas. *S.*—*D J E.* Plumbago capensis. —*J B S.* Solanum dulcamara, a poisonous plant, but not the Deadly Nightshade.—*A Z.* Spiranthes autumnalis.

Names of Fruits: *F.* The Minchal Crab.—*Hector.* Your Plum appears to be the Wine Sour. The gum which has exuded from it is similar to that which proceeds from the branches of Plum trees, only more transparent, for it is actually brilliant, almost like the diamond. Vicissitudes of dryness and moisture are the principal causes of gumming.

Tree Seeds: *E N.* Every great seedsman can procure you the seeds of American and other forest trees. He will obtain them from the importers, if he does not import them himself. The Locust tree is the common Acacia, as is known to every garden labourer, but unknown, as it seems, to Mr. Cobbett, who has been dead many years.

Misc: *H E.* A man is not a nurseryman or grower for sale if he merely raises a seedling flower and sends it out himself. We should regard him as an amateur and place him accordingly.

* As usual, many communications have been received too late and others are unavoidably detained till the necessary inquiries can be made. We must also beg the indulgence of those numerous correspondents, the insertion of whose interesting contributions is still delayed.

BLOOD MANURE FOR WHEAT.

THE PATENT NITRO-PHOSPHATE OR BLOOD MANURE COMPANY.

TRUSTEES.

ABEL SMITH, Jun., Esq., M. P., 2, Halkin Street, West.
CHARLES DIMSDALE, Esq., Essendon Place, Herts.
EDWARD BALL, Esq., M.P., 8, Belgrave Road, Pimlico.
MAJOR-GEN. HALL, M.P., Weston Colville, Linton, Cambridge.
JOHN BRADY, Esq., M.P., Warwick Terrace, Belgrave Square.

DIRECTORS.

Chairman.—JONAS WEBB, Esq., Babraham, Cambridgeshire.
Deputy-Chairman.—JOHN SHARP, Esq., Tower Villa, Queen's Road, Regent's Park.
EDWARD BELL, Esq., Tottenham, Middlesex.
JOHN CLAYDEN, Esq., Littlebury, Essex.
RICHARD HUNT, Esq., Stanstead Abbot, Herts.
THOMAS KNIGHT, Esq., Edmonton, Middlesex.
ROBERT LEEDS, Esq., West Lexham, Norfolk.
ROBERT MORGAN, Esq., 72, Camden Villas, Camden Town.
THOMAS NASH, Esq., Great Chesterford, Essex.
JAMES ODAMS, Esq., Bishop Stortford, Herts.
JOHN COLLINS, Esq., Middleton Square, Pentonville.
(*With power to add to their number*).

Bankers.—Messrs. BARNETT, HOARE, & Co., Lombard Street.
Auditor.—JAMES CAIRD, Esq., Baldoon, and 6, Sergeant's Inn, Fleet Street, London.
Secretary and Chemist.—JAMES TAYLOR, Esq., F.C.S.
Solicitors.—Messrs. KINGSFORD & DORMAN, 23, Essex St., Strand.

MANUFACTORY, PLAISTOW MARSHES, ESSEX.

The Directors of the above Company (many of whom are eminent agriculturists), beg to call the attention of their friends and the agricultural community to their Patent Blood Manure, which is composed of Bones dissolved with sulphuric acid, to which is added about 1500 lbs. of pure Blood to every ton of the Manure, carefully dried and prepared for the drill or hand sowing. Being rich in Nitrogen and other necessary ingredients, it is especially adapted for the Wheat Crop, and has been used with the greatest success in all parts of England.

It is a very remarkable fact that the analysis of Blood and the grain of Wheat are nearly identical, as proved by the most eminent chemists; it contains all the elements which plants require, and when properly prepared and applied, will become the essence of vegetable as well as of animal life.

The highly fertilising properties of Blood has been commented upon by Professor WAY, and others, and the success of the Blood Manure for Wheat Crops has been fully proved upon all soils, by the practical experience of numerous agriculturists, a few of whom are the following:—

Sir Archibald M'Donald, of Woolmer Lodge, Liphook, says: "The Wheat manure I purchased of you has answered its purpose admirably."

Jonas Webb, Esq., Babraham, Cambridgeshire.—"Your Wheat manure I tried by the side of guano, and if anything it had the advantage, as the quality from it is superior."

Mr. Baker, Steward to His Grace the Duke of Bedford, Park Farm, Woburn, Bedfordshire.—"I used your manure upon a piece of poor land after Peas, and have grown an excellent crop of Wheat."

Mr. Benjamin Goulton, Gedney Marsh, Long Sutton, Lincolnshire.—"I drilled your manure at the rate of 2½ cwt. per acre, along with the Wheat over 30 acres, and although the field is the poorest land I have on my farm, the crop ranked amongst the best I have. I do not know how I can recommend it better than by saying I shall use it much more extensively this season."

"Mr. Walter Murton, East Stour, Ashford, Kent.—"I sowed your Wheat manure last autumn, and the consequent increase in the crop both of corn and straw has convinced me of its great utility."

Mr. H. Steed, Nonington, near Wingham, Kent.—"I used Odams' Patent Manure for Wheat last November, and never have I used any artificial manure with such benefit."

Mr. Frederick Robinson, Southery, near Downham Market, Suffolk.—"I last autumn used 2 cwt. of your manure per acre on a piece of fen land; it came up very strong in plant, assumed a most healthy appearance during the winter, and has produced me one of the finest crops I ever grew."

Extract from the *Agricultural Gazette*, 7th April, 1855.—"The Nitro-Phosphate Company throw blood and bones together, and add sulphuric acid, thereby manufacturing a manure, which, as it contains soluble phosphate along with nitrogenous matter, is as nearly perfect, whether for roots or corn, as anything can ordinarily be."

Extract from the *Mark Lane Express*, of January, 1854.—"Amongst the new things which appeared this year for the first time was Odams' Patent Blood Manure; and it is this addition to our fertilisers which falls to our province to review. Blood has long been acknowledged one of the most enriching of all our manures, a proposition the soundness of which has been proved by innumerable experiments. Now that the startling fact has reached the ears of the agricultural public that Peru will be exhausted of Guano in a few years, surely the prospects of an everlasting supply at home will be accepted with some degree of national satisfaction, more especially since the latter is superior to the former in quality."

The Public are cautioned against spurious imitations; as security to the purchaser every Bag is marked "ODAMS' PATENT BLOOD MANURE," and sold only by the authorised Agents of the Company.

OFFICES, 109, FENCHURCH STREET.

Price 7*l.* 10*s.* per ton, free at any Railway or Wharf in London.

DIRECTIONS FOR USE.—From 2 to 4 cwt. per acre, according to the condition of the soil. It may either be drilled in with the seed or sown broadcast; if the latter it should be well harrowed in.

THE LANDS IMPROVEMENT COMPANY.—Incorporated by Act of Parliament, 1852—53, for England and Scotland, and further empowered by Amendment Act, 1854—55. To Landowners, the Clergy, Solicitors, Estate Agents, Surveyors, &c., Tenants for Life, Trustees, Owners in Fee, Incumbents of Livings, Bodies Corporate; Lessees for Lives renewable, or for a term of more than 25 years; (and Lessees for Lives not renewable, or for a term less than 25 years, with consent of their Lessor), &c., are enabled, by way of Loan from the Company, or by their own funds, to execute and charge on the Lands improved, by way of rent-charge for a term of 25 years, repaying capital and interest, the cost of every landed improvement, especially of Drainage, Irrigation, Warping, Embanking from the Sea, from Lakes, Rivers, or Streams, Inclosing any Land, or improving Drains, Streams, or Water-courses, Reclamation, Farm Roads, Clearing, Erection of Farm-houses and other Buildings required for farm purposes, and the Improvement of and Additions to Farm Houses, and other Buildings for Farm purposes already erected; Planting for Shelter and for Periodical Cuttings, Jetties or Landing Places on the Sea Coast or on the banks of navigable Rivers or Lakes in the Highlands and Islands of Scotland; Engines and Machinery for Drainage, Engine-houses for Farm Steadings, &c., Water-wheels, Tanks, Pipes, Water-courses, Bridges, Sluices, &c. The Plans of Buildings, Specifications and estimates are prepared by the Applicant's own Agents and are submitted to the approval of the Inclosure Commissioners' Inspectors who are also the sole judges of the due execution of the works. Proprietors may apply jointly for the execution of Improvements mutually beneficial,—such as a common Outfall—Roads through the District—Water power, &c. The Directors wish it to be understood that the Company is of a strictly commercial character, and that the details of the Plans and of the execution of the Works are not interfered with by them, but are controlled by the Landowner and by the Inclosure Commissioners. For further information and for Forms of Application, apply to the Honourable WILLIAM NAPIER, Managing Director, 2, Old Palace Yard Westminster.

THE FOLLOWING MANURES are manufactured at Mr. LAWES' Factory, Deptford Creek:—Turnip Manure, 7*l.* per ton; Superphosphate of Lime, 7*l.*; Sulphuric Acid and Coprolites, 6*l.*

Office, 69, King William Street, City, London.

N.B. Genuine Peruvian Guano, guaranteed to contain 16 per cent. of ammonia. Nitrate of Soda, Sulphate of Ammonia, and other Chemical Manures.

THE LONDON MANURE COMPANY'S NITRO-PHOSPHATE OR WHEAT MANURE FOR AUTUMN SOWING.—This Manure, composed of blood, animal matter, and dissolved bones with silicates, is most strongly recommended to the notice of Agriculturists. It contains from 7 to 8 per cent. of nitrogen, in a form yielding ammonia by slow decomposition, and is therefore particularly adapted for Wheat. The quantity required is 2 to 3 cwt. per acre drilled in with the seed. Price, per ton, 7*l.* 10*s.* in London.

PERUVIAN GUANO, FISHERY SALT, and every other MANURE on best terms, strictly warranted.

40, Bridge Street, Blackfriars. E. PURSER, Sec.

ARTIFICIAL MANURES, &c.—Manufacturers and others engaged in making ARTIFICIAL MANURES may obtain every necessary instruction for their economical and efficient preparation, by applying to J. C. NESBIT, F.G.S., &c., Principal of the Agricultural and Chemical College, Kennington, London. Analyses of Soils, Guanos, Superphosphates of Lime, Coprolites, &c., and Assays of Gold, Silver, and other Minerals, are executed with accuracy and dispatch. Gentlemen desirous of receiving instructions in Chemical Analyses and Assaying, will find ample facility and accommodation at the College.

DRAINAGE OF LAND.

MR. HUMBERT, of Watford, Herts, a practical Surveyor and Land-Agent of more than 15 years' standing, offers his services to Gentlemen about to drain Land and Bogs. He will undertake to set out and superintend himself the execution of the work at a charge of 5*s.* per acre, and the expenses incurred in his travelling; or he will contract to complete it in a specified manner to the satisfaction of the Inclosure Commissioners at a fixed price per acre. Mr. Humbert has drained strong stony land in the most careful and complete manner, with 1¾ inch pipes, and proper mains, the drains being 4 feet deep and 30 feet apart, at 4*l.* per acre and under, and he can give reference to his employers in that and in other instances.

Watford, Herts, Sept. 15

ROYAL AGRICULTURAL COLLEGE, CIRENCESTER.

Patron—His Royal Highness Prince ALBERT.
President of Council—Earl BATHURST.
Principal—Rev. J. S. HAYGARTH, M.A.
Professors, &c.:—
Chemistry—J. A. C. VOELCKER, Ph.D., F.C.S.
Zoology, Geology, and Botany—JOHN BUCKMAN, F.G.S., F.L.S.
Surveying, Civil Engineering, and Mathematics—F. ARMSTRONG, C.E.
Manager of Farm—G. AUSTIN.

Students are admitted after the summer and winter vacations, also in April and October. The annual fees for boarders vary from 45 to 80 guineas, according to age and other circumstances. The fee for out-students is 40*l.* per annum. The College course of lectures and practical instruction is complete in one twelvemonth, although a longer course is recommended. There is a department for general as well as for agricultural purposes. Prospectuses and information can be had on application to the Principal.

COLLEGE OF AGRICULTURE AND CHEMISTRY, AND OF PRACTICAL and GENERAL SCIENCE, 37 and Lower Kennington Lane, Kennington, near London.

Principal—J. C. NESBIT, F.G.S., F.C.S., &c.

The system of studies pursued in the College comprises every branch requisite to prepare youth for the pursuits of Agriculture, Engineering, Mining, Manufactures, and the Arts; for the Naval and Military Services, and for the Universities.

Analyses and Assays of every description are promptly and accurately executed at the College. The terms and other particulars may be had on application to the Principal.

SMITHFIELD CLUB, 1855.—FAT CATTLE SHOW.—The ANNUAL CHRISTMAS SHOW of FAT CATTLE, SHEEP, and PIGS, will take place on the 11th, 12th, 13th, and 14th of December, 1855, at the Carriage Bazaar, King Street, Portman Square, when nearly 800*l.* will be awarded in Prizes and Medals.

The printed forms of Certificates, properly filled up, must be returned to the Honorary Secretary on or before SATURDAY, November 10th. Prize Sheets and the necessary printed forms of Certificates are now ready, and can be obtained on application to B. T. BRANDRETH GIBBS, Honorary Secretary, Corner of Half-moon Street, Piccadilly, London.

All communications on the Club's business should bear the words "Smithfield Club" on the outside.

The Agricultural Gazette.

SATURDAY, SEPTEMBER 15, 1855.

A SOIL is to be regarded as a laboratory in which food for plants is prepared: its fertility depends not only on being under suitable climatic conditions, fitted for administering what food for plants it may contain; not only on the abundance of this food that may be present in it, but also on the means it has within it of preparing rapidly and properly that food for use. Under this head, accordingly, should come an explanation of the fertilising influence of all tillage operations: of liming and burning, and of those absorptive properties on which Professor WAY has shown fertility to be so much dependant.

Tillage is useful by increasing the amount of surface within the soil on which atmospheric solvents operate, by facilitating the access of such solvents to that increased surface, and by introducing air within the soil. That it has the last effect will be seen by any one who shall try to return the earth into the hole which he has just dug in the hardened ground; the heap remaining over obviously represents the increased bulk of air which has been thus mixed in, and that its effect there is favourable to fertility is apparent from such experiences as those of TULL and of the Rev. Mr. SMITH, of Lois Weedon, which have already been frequently referred to in these columns. This subject has been well discussed by Dr. DAUBENY in the lecture which he lately gave at Oxford on Lois Weedon cultivation and its results, and which was published shortly after its delivery in this Journal. He expresses his belief that the exposure of the soil in complete detail to the influence of rain-water and of heat and cold and air, which is effected by tillage operations, will enable it to yield in a form capable of immediate use sufficient phosphoric acid and other mineral substances needed for plants to supply successive annual crops for many years without any artificial addition; and that the natural supply of nitrogen in a useable form—as that of ammonia in rain-water, or of nitrates created in the soil by the action of ozone* on the nitrogen of the air in the presence of certain earths, or let us add of the carbonate of ammonia floating as a gas in the air, and capable of direct absorption by the leaves of plants; that these natural supplies may, in certain classes of plants, prove sufficient without artificial dressings of ammoniacal manures for the vigorous growth and productiveness of these plants. But whatever the explanation of it may be, the fact is that by tillage operations Mr. SMITH has obtained many successive crops of Wheat, and his experience at Lois Weedon, and that everywhere obtained on fallow ground, and the well known results of tillage operations equally universal, seen in the vigour of crops so treated, as instanced in the hand-hoeing of Wheat and the horse-hoeing of Turnips—all these teach that fertility is dependant in a great degree on tilth; that many a case of comparative barrenness is removable by the use of tillage implements even without the manure cart; and thus, as the fable tells us, that there is a treasure lying buried in the field which only needs industrious, deep, and thorough search for its discovery.

We must refer especially to the burning of clay as a means of increasing the fertility of clayey soils—both because practice has long sanctioned the operation and because Dr. VOELCKER has very skilfully and thoroughly investigated it. The results of his investigation are best given in his own words, which are extracted from his paper in the xiith volume of the Journal of the English Agricultural Society.

(1.) "The mechanical changes produced in clay upon burning, which by no means are *unimportant*, nevertheless do not sufficiently explain the fertilising effects of burnt clay.

(2.) "These are dependent on the chemical as well as on the mechanical changes both produced upon burning clay.

(3.) "The fertilising effects of burnt clay are mainly dependent on the larger amount of potash which is liberated from the insoluble silicates of the clay in the process of burning.

(4.) "Burnt clay contains more soluble potash than the same clay unburnt.

(5.) "In burning clays similar effects are produced as in bare fallow.

(6.) "Burnt clay improves especially Turnips, Carrots, Potatoes, and other green crops, because it supplies potash, which these crops largely require, more readily than unburnt clay."

These conclusions at which he arrives exhibit burning, when properly conducted, as one of the most efficient laboratory operations that can be carried on in a stiff soil, yielding, it is said, large quantities of soluble material as food for plants which formerly lay in an inaccessible and useless state, resembling thus in its effects those of tillage operations.

Liming too must be referred to as another important laboratory operation on and in the soil. It acts in many ways; partly, no doubt, by its influence on the texture of the soil; partly by its influence on the crude vegetable matters which the soil contains; partly by neutralising mischievous acids, to the presence of which, as in the case of boggy land, infertility is sometimes due; partly by displacing the mineral alkalies and silica from inaccessible positions, and bringing them into use as food for plants; partly by decomposing poisonous proto-salts of iron uniting with their acid and placing the mischievous prot-oxide with which that acid was united in a position to become per-oxidised, rendered harmless and even useful; and partly perhaps as a direct food to plants, but chiefly, we believe, in the manner which Prof. WAY related in his lecture to the Agricultural Society last year. For "(1.) the presence of lime in a certain quantity in the soil is found to increase its power to absorb carbonate of ammonia from the air; and (2) when added in greater quantities it is found to detach ammonia from the soil and render it available for the use of the plants growing on it." The latter is the ordinary and long known effect of the use of lime, the novelty brought out by Professor WAY's research on this point being the very large quantity of ammonia present in the soil for such use. An ordinary top soil of London clay contained one grain of ammonia in every 1000 grains of soil—an

* Ozone is a peculiar condition of the oxygen of the air produced during combination and analogous chemical processes.

enormous quantity—and such as would not be supplied by several tons of guano. But the former power which lime is believed to confer upon the soil, that of facilitating the absorption of ammonia from the air, is altogether new to agricultural theory, and though not yet certainly established by Professor Way's experiments is rendered probable by the results of very many of them, and it is consistent (in a somewhat singular manner) with known chemical analogies.

This connection of lime with the absorptive powers of soils leads us to the last topic we shall have to treat of in enumerating the causes of fertility which science has ascertained. This power of the soil to remove from their solutions ammonia, potash, lime, &c., which in the first of these particulars had been observed by Mr. Thompson, of Moat Hall, has been investigated with the most valuable results, as has long been well known to the agricultural world, by Mr. Way. His writings in the Journal of the English Agricultural Society must, of course, be consulted by those who wish to learn fully the nature and the sources of this obviously important power in fertile soils. That barrenness must for the most part follow the absence of this power in soils is plain—for plants cannot be dependent on the daily attention of the farmer to supply them with food. As a general rule, if that is given once a year it is the most the cultivator can effect; and it is well that in the soil itself there are means for retaining what is given it till the plant requires it. These absorptive powers are no mere function of the whole soil, arising out of texture, &c.; but seem to be dependent on the presence of certain substances in it, so that the addition of these substances will remove any infertility arising out of any deficiency of these powers. But the principal result of Mr. Way's investigation may be best given in his own words: "Soils were found to possess in a greater or less degree the power of removing from solution in water certain animal and vegetable substances, but still more the alkaline bases, ammonia and potash, and the earths, magnesia and lime. These bases the soils were capable of separating from their salts, and retaining more or less in spite of the action of water. It was afterwards discovered that a certain class of artificial double alkaline silicates had a similar power, and for several reasons it was concluded that it was to the presence of portions of these double silicates that soils owed the power in question." That is the main fact which Mr. Way's researches have determined. Upon the relation of lime to this faculty of the soil, he further says: "It was observed that an ordinary soil had the power of collecting from the air and incorporating with itself gaseous carbonate of ammonia in the atmosphere with which the soil was in contact, and as in the previous case the action was referred to the presence of one or other of these double silicates in the soil: and then follows his reference to the theory regarding the fertilising agency of lime—its relations to the absorption of ammonia to which we alluded as probable, but only to some extent confirmed by the experiments that had been made. Mr. Way goes on to say: "An essential difference here presented itself. Ammonia could be removed by soils from its solution in water, in virtue of their containing either the double lime or double soda silicate—the two substances of the class supposed to be most usually present; whereas it was found that the lime salt alone was capable of removing ammonia from its atmospheric solvent. In several soils that I examined a good deal of the double silicate of soda was present, and it seemed probable that its conversion into the corresponding lime salt would put the soil into a better condition for absorbing ammonia from the atmosphere. Now as the natural fertility of soils is evidently in some very distinct way connected with this absorption of atmospheric ammonia, it will at once be seen that a very important part would thus be found for lime to play, in enabling the soil in a given time to absorb a larger amount of valuable alkali. In this view the application of lime would in fact be indirectly a manuring with ammonia." The reader must be referred for a detailed explanation of this theory, and for a recital of the experiments on which it is based, to Professor Way's lecture in the last volume of the Journal.

But we must not pursue this subject further. It is chiefly, we may add in conclusion, by means of this admirably conducted research of Mr. Way's into the absorptive properties of soils, that an explanation is given of that great agricultural paradox which meets the student on the very threshold of his readings on the chemistry of agriculture. He is told that agriculture is simply a food manufacture; that the produce of its processes is made of materials existing in the air and soil, that only substances soluble in water are available for this purpose, and yet of the whole mass of mineral matter concerned in this manufacture not only does he find that it is thinly spread, some 6 or 8 inches thick, in a layer over an enormous surface, and there washed annually by four times its own bulk of one of the most powerful natural solvents; but that positively this manufacture is most productive, its produce largest, where this solvent is permitted to run *through* the land in its escape downwards to the sea. Fresh from the manipulations of the laboratory, acquainted with the processes by which precipitates are deprived of any soluble mixtures which they may contain, having himself patiently superintended the washing of earthy deposits on his filter, how is he to reconcile the assertion of science, that fertility depends on the presence of soluble matter in the soil, with that of practice that fertility depends very materially upon your enabling the water which falls upon the surface of the land to pass through its whole thickness, and escape through channels in the subsoil. Mr. Way has satisfactorily removed the difficulty. Not only does rain water, when allowed to traverse that thin layer out of which our food is made, improve the underground climate, on which, as we have seen, the luxuriant growth of plants materially depends—not only does it by its passage act as waiter at the repast, carrying food to the roots of the growing plants—not only does it bring to the soil the riches of the air, and so add to its wealth as a well filled storeroom—not only does it by the additions which it thus supplies and the activity which drainage gives it, and its own solvent power, make the whole an active laboratory in which food for plants is being prepared for use; but its liability to waste the contents of this storeroom and the products of this laboratory by the access and egress which it possesses, is held in check by these means which Professor Way has so well investigated—so that a fertile soil is really not only one of the pleasantest sights on which the eye can rest, but one of the most beautiful specimens of ingenious and conservative contrivance on which the mind can dwell.

GREAT REAPING MACHINE COMPETITION AT STIRLING.

This competition came off on Thursday last on the adjoining farms of Stewarthall and Muirton, tenanted respectively by Mr. Forrester and Mr. MacLaren. The interest excited was not of course so great as in former years, in consequence of this being the third competition that has taken place here, and from the fact that no new machine was on the ground. The place selected for the competition was exceedingly convenient, and very nearly the same as the ground that was travelled over last year. The crops in general were good, but if anything too ripe. This was especially applicable to the Barley, which should, we think, have been cut nearly a week ago. The most noticeable feature of this year's trial was that no new machine was entered for competition, there being only the three distinctive principles represented, namely, Bell's, Hussey's, and M'Cormick's. These were of course varied by the different exhibitors, but no new principle was brought out. Eleven machines were entered for competition last year, while this year only eight made their appearance. These were as follows:—

1. Crosskill's Bell.
2. M'Cormick's improved by Lord Kinnaird, and made by Bury, of Mylnefield.
3. Dray's Hussey, exhibited by Mr. Forrester, Stewarthall.
4. Dray's Hussey, exhibited by himself.
5. M'Cormick's, exhibited by Mr. Alexander, Taylorton.
6. Dray's Hussey, exhibited by Mr. MacLaren, Craigton.
7. Dray's Hussey, exhibited by Mr. Mackie, Kersepatrick.
8. Bell's, exhibited by Mr. M'Queen, Arnhieve.

It will thus be seen that the principle best represented on the field was that of Messrs. Dray & Co., who are the makers of Hussey. This probably arises from the fact that this machine is the favourite in this locality among the farmers; and three of them exhibited their own machines.

1. Crosskill's Bell. The first grain cut by Bell's was Oats, a full crop, a good deal laid. In this the work was very well performed, and three quarters of an acre cut down in a very short space of time. Afterwards it was sent to the Barley, and four cuts having satisfied the judges, it was next sent to Beans, of which it made excellent work, and we must say, better than anything on the field. In Wheat it also did well; but the crop being very much laid indeed, the work was not nearly so well accomplished as in the case of the other kinds of grain. The great objection to this machine is its high price, 42*l.*, which is, we believe, to be raised; and the great draught upon the horses. The pair we saw in the machine were fatigued to such an extent that the perspiration was running off them as if they had been bathed. The horses were, however, shifted, and the work on the whole went on most satisfactorily. The breadth cut by this machine was 6 feet 2 inches.

2. M'Cormick's, improved by Lord Kinnaird. There was no apparent improvement upon this machine since last year. It performed its work very indifferently sometimes, and once or twice stuck altogether. Its peculiarity consists in the application of the endless web, of Bell's, to the principle of M'Cormick's. It has not hitherto made much progress among the agricultural community, although sometimes we have seen it work admirably.

3. Hussey's with Dray's improvement, attached by Gardner, of Stirling, exhibited by Mr. Forrester, of Stewarthall. This machine went through all its work very well indeed, especially the Oats and Wheat. It is destitute of the latest improvement by Dray; and we were rather surprised at its being preferred before Dray's own with the latest alterations, which are most certainly improvements. However, its work was fully equal to anything on the field, and it took the second prize.

4. Dray's Hussey with the latest improvements. The principle of these consists of a protecting shield of zinc to secure the stray stalks from getting entangled with the foot, and preventing the tilting table from being wrought easily. The work which this machine made was very fair. It was, if anything, a little defective among the Beans—cutting we thought, through a mistake, too high. In the Wheat, which was very much laid indeed, and in fact altogether the worst crop we ever saw cut with machines, it did its duty well, and cut comparatively clean and smooth. This machine cut a breadth of 5 feet, and was much admired by the practical men present. A great many are in use among the agriculturists of this locality.

5. M'Cormick's original, exhibited by Mr. Alexander, of Taylorton. This machine has been wrought by Mr. Alexander for a year or two, and has given great satisfaction. It performed its work in good style, only stopping once or twice to be put in order.

6. Dray's Hussey, exhibited by Mr. Maclaren, of Craigton. This gentleman is the agent in this locality for Dray's machines; and the one he has had at work on his own farm was used by him on this occasion. Its work among the Oats was admirable, while in the Beans it did not cut so clean, but on the whole there was nothing to find fault with.

7. Dray's Hussey, exhibited by Mr. Mackie, of Kersepatrick. There was no difference between this and the other machines manufactured by Mr. Dray.

8. Bell's, as exhibited by Mr. M'Queen of Arnheive. This machine wrought equally well with the rest, cutting the various crops with cleanness and efficiency.

It will be seen from the above report that all the machines were as near perfection as possible; and the judges must have had a very arduous task to accomplish in deciding between them.

The judges were Messrs. John Miller, C.E., of Millfield; John Gibson, Woolmet; Robert Walker, Portlethan; Peter M'Ewan, Blackdub; and James Stirling, C.E., Edinburgh. Their award was as follows:—"We, judges appointed to award the premiums offered by the Highland and Agricultural Society of Scotland, for the most approved reaping machine of the values undermentioned, and competed for this day on the farms of Stewarthall and Muirton, under the auspices of the Stirling General Agricultural Association, do hereby award the same as follows, viz., the premium of 20*l.*, for the best reaping machine of any price, to No. 1 of the Committee's list—Messrs. Wm. Crosskill and Sons, Beverley; and the premium of 20*l.* for the best reaping machine not exceeding 25*l.* in price, to No. 3 of the Committee's list—Mr. Wm. Forrester's Hussey, with Dray's improvement attached by Gardner, of Stirling. That while the judges were unanimous in the foregoing award, they think it right to express their satisfaction with the performance of the other machines on the ground, which was, on the whole, superior to that of former years."

This award will give, we believe, much satisfaction, as it was the opinion of every practical man with whom we conversed that those two made the best work on the field. *From the Stirling Journal.*

THE SOIL AS A STORE-ROOM OF FOOD FOR PLANTS.

The maxim "the more stock the more corn" is related to the subject of the series of papers on Fertility which have been published in another section of this Journal, through the fact that a fertile soil is a store-room of food for plants: but the practical aspect of the question—the supply and economical management of manures—has already been discussed, and must be merely named here. I will now state some of the results of the chemical analysis of soils. The examination of plants proves that by means of soil and air they must have access to carbon, oxygen, hydrogen, nitrogen (which are supplied by water), carbonic acid, and ammonia (found both in the air and in fertile soils); also to the alkalies—potash and soda; the earths—lime and magnesia; certain metallic oxides—those of iron especially, if not exclusively; and certain acids—phosphoric, silicic, hydrochloric, and sulphuric. All fertile soils, therefore, besides their bulk of mineral matter—sand and clay and lime in due proportion, so as to bring about a fitting consistency and texture—must contain ammonia, the mineral alkalies, phosphoric and silicic acid (in soluble silica), sulphuric acid, and chlorine. Add to this that all fertile soils have contained vegetable matter, and therefore, it is presumed, *must* contain it. Such matters by their decay furnish organic and inorganic food for plants in the fittest state for use, and at the same time act as ferments in the soil, facilitating further disintegration; they are also useful as tending to a good texture of soil.

Fertility is, however, not by any means to be supposed proportioned in any degree to the quantity of

vegetable matter present in a soil; many barren soils have, in fact, been so, owing to the *presence* of vegetable matter *in excess*. The following specimens of the result of the chemical examination of soils are taken from Dr. Voelcker's essay on the subject in Morton's "Cyclopedia of Agriculture."

1. Fertile soil in North Holland by Mulder. 2. Poor sandy mould in Brunswick, by Sprengel. 3. Clay soil near Cirencester, by Dr. Voelcker.

It would be easy to multiply instances in which such differences in mineral structure should occur in respect of the alumina, silica, lime, magnesia, and in vegetable matter, as creates those broad distinctions amongst soils such as clayey, light and marly, calcareous, peaty, moulds, loams, sands, clays, &c.; but it would be found that fertility is not so dependant on the relative quality of these bulky ingredients as upon the presence of phosphoric and ammonia alkalies, and a certain proportion of decaying vegetable matter in their midst; not so dependant on the structure of the warehouse provided drainage, &c., have given us access to it, as upon its contents, namely, the quantity of those more important substances present generally in small quantities. It will be seen in Nos. 1 and 2 above, that the contrast in fertility between them is accounted for by the differences in the alkalies, ammonia, and phosphoric acid—substances which are supplied in manure, and to which the fertilising influence of manure is due. It is obvious then that soils may either differ or be like one another as regards their texture or mechanical structure, and their fertility may be altogether independant of such differences or resemblances. The following analyses of brashy soils are instructive on this point; they are by Dr. Voelcker:—

	1. Brash of the inferior oolite	2. Brash of the great oolite.	3. Cornbrash.
Carbonate of lime	86.20	86.346	89.195
Magnesia	.54	.739	.771
Sulphate of lime	.09	.204	.241
Oxides of iron		...	
Alumina	4.14	1.432	2.978
Phosphoric acid	.06	.124	.177
Soluble silica ...	2.75	1.016	1.231
Insoluble siliceous matter	3.27	.533	4.827
Alkaline salts ..	Undetermined.	Undetermined.	Undetermined
	99.85	99.384	99.420

And Professor Buckman's comment on them is quite in keeping with our present subject:—"They all resemble one another in mineral texture, but differ materially in agricultural value, as their chemical constitution readily explains. These three stone brashes represent, as nearly as may be, a large tract of country which occupies the middle of England, and rising more or less abruptly from the vales of Berkeley, Gloucester, and Evesham, forms the Cotteswold range of hills. Of this range about one half is composed of the inferior oolite, which is for the most part but a poor sheep-farming district. Towards Cirencester, or the more southern part of the Cotteswolds, the great oolite sets in, there is at once a visible improvement in the land, and an increase of produce; but even this improved state of things meets with still greater improvement south of Cirencester, where will be found, here and there, districts of limited extent covered with cornbrash: the cornbrash of all the brashes being good natural corn land, and hence the name, while the other brashes only yield corn that is, as it were, wrung from them with great labour and expense.

"The great cause of expense is the obtaining manure, and much of the recent improvements, which may everywhere be noticed, may be traced to the extended use of bones, which have enabled the Cotteswold farmer to increase his Turnip crop. Now, inasmuch as bones consist of phosphoric acid and lime, a glance at the three analyses just quoted will show how one rock makes a soil naturally better than another, for No. 1 yields .07, No. 2, .124, and No. 3, .177 of phosphoric acid, the important element of bones. The plain conclusion, therefore, is that corn-brash affords the best corn-growing land, because it has the most bones in it. If we look to the average yield of grain for the three brashes here commented upon, we shall see the same facts illustrated in what may be termed the practical way. The following table represents the average of grain in bushels per acre:—

Crops.	1. Stonebrash. Inferior oolite.	2. Stonebrash. Great oolite.	3. Cornbrash.
Wheat	15 to 20	20 to 25	25 to 30
Barley	25 to 30	30 to 35	40 to 45
Oats	25 to 30	35 to 40	45 to 50

This table illustrates facts and principles which will be readily understood by the cultivator of the soil, and we therefore now offer the landlord's touchstone of value in the following table representing the average rent:—

Formation.	Rent the acre.
1. Stonebrash, inferior oolite	7s. to 20s.
2. Stonebrash, great oolite	14s. to 25s.
3. Cornbrash	20s. to 40s.

"These facts tend to show that the reasons for practical results may be clearly made out by the scientific inquirer, and from these he is enabled to illustrate great principles, a right understanding of which would, as true knowledge always does, lead us to think more modestly of ourselves; for if we are fortunate enough to live in a district where everything looks prosperous, the crops good, and farmers rich, and, consequently as the term goes, respectable, we are not always to conclude that this has arisen from our superior knowledge or intelligence, for it may be after all merely that there are more bones in the soil."

The same truth, namely, the need to fertility of these mineral substances—phosphoric acid and the others present in small quantity—is gathered from an examination of our manures, bone-dust, guano, &c., small quantities of which applied per acre produce such marvellous increase of fertility. The examination of bulkier manures, farmyard dung, and even marl, is equally illustrative of this truth. The following are marls analysed by Professor Way, much used, and deservedly valued as dressings; and these analyses, by a reference to the phosphoric acid and the alkalies which they prove to be present, amply explain the value which in practice has been attached to them.

	1. Fossiliferous gree marl.		2. Gray marl or malm.	
	Soluble in dilute acids.	Insoluble in dilute acids.	Soluble in dilute acids.	Insoluble in dilute acids.
Silicic acid (silica) .	31.88	22.06	2.16	16.68
Carbonic acid	Undetermined.	...	29.16	...
Sulphuric acid ..	.45	...	0.21	...
Phosphoric acid ..	3.76	...	0.21	...
Chlorine	Trace.	...	0.08	...
Lime	5.61	1.52	41.52	1.71
Magnesia	.85	1.09	.30	A trace.
Potash	3.21	.45	.26	.32
Soda	1.20	.31	1.64	.07
Protoxide and peroxide of iron ..	16.91	5.75	2.20	5.57
Alumina ..	.74		.11	

No. 1 is from the green sand formation.
No. 2 Chalk marl, extensively applied as a manure.

It is on the natural wealth of the soil as a storeroom of these substances—I refer to those which in the above table are described as soluble in weak acids—and the artificial addition of them, where naturally they are deficient, that fertility in a great measure depends. Beside the alkalies and phosphoric acids, ammonia and nitrates, as supplying the nitrogen that plants need, especially to form seed, are of course essential elements of all fertile soils; and guano, farm-yard dung, and other manures, owe their fertilising influence largely to their presence. Fertility is to be maintained and increased by the economical management of all sources of such substances and the liberal application of them to the land; and seeing that the common forms in which ammonia exists are volatile, the more care is needed to ensure its preservation, whether in the solid or the liquid manure to which the farmer has access. It is right to add one word in reference to the influence of depth of soils on their fertility. It is connected especially with this aspect of the subject, for it is obvious a soil of double depth is a warehouse twice as large, capable therefore of containing twice the food for plants, and not so liable to exhaustion. One word too must be allowed upon that barrenness which arises from cross cropping, and from continuous export of dairy and other produce; it is attributable for the most part simply to a more rapid issue of the contents of this warehouse than either the direct supplies from without in the shape of manure, or the defective agencies at work as in a laboratory within the soil itself, permit. Such infertility accordingly is removable by manuring: the addition of bone dust to the pasture lands of Cheshire has restored that fertility which had been lost through the export of bone dust in the milk and cheese sold off the farm. Such infertility is also removable by giving fresh life to all those agencies at work within the soil itself for the supply of food for plants, and so tillage has to a certain extent proved the equivalent of manure.

INFLUENCE OF STATISTICAL INFORMATION ON THE CORN TRADE.

[From the Minutes of Evidence taken before the Lords' Committee on Agricultural Statistics.]

LEONE LEVI, Esq., examined.—I believe merchants consider it of very great importance to them to be as early as possible made acquainted with the probable wants of the country in matters of food; because I need not say that the prices of grain have a very great influence on the prices of all other articles, and the *Mark Lane Journal* is the barometer by which the value of all other articles is regulated. It is also of the utmost importance to merchants, in order to regulate their speculations and their orders abroad for other articles of consumption, to be specially informed whether we shall have abundance of grain at home, or whether we shall have to seek from foreign countries very large supplies. The influence of such uncertainty upon the funds is always remarkable, and upon the bullion in the Bank. The possibility of having to send a great deal of gold abroad has very considerable influence on private credit, discounting bills, &c. &c. All those transactions are very considerably affected by the uncertainty which prevails as to the result of the crops in this country. Suppose at the very last moment we should find ourselves to be in want of about five or six millions of quarters to be imported into this country in two or three months, of course the price of grain would rise enormously. Let us calculate that, owing to the suddenness of the demand, the rise might be about 6*s.* a quarter beyond the natural rise that would have taken place if it had been known before. Then to these 6*s.* there must be added, also, a very considerable rise in the rate of freights; for instance, I find that, during 1846 and 1847, the freight from Odessa to this country for tallow ruled from 50*s.* to 110*s.* a ton; and from the Danube from 9*s.* to 21*s.* per quarter; and from Alexandria from 6*s.* to 12*s.* during 1846. Now, let it be admitted that, owing to the suddenness of the rise, as we must have the grain speedily brought in, the rate of freight also should rule 6*s.* per quarter higher than need be; that would make nearly 10*s.* a quarter, which, upon six millions, would prove a loss to the public of about 3,000,000*l.* sterling. And this may actually be ascribed to our finding all at once to be in want of large supplies, and to the fact that for that reason speculation did not go on regularly from the commencement of the season to the last. There are other reasons besides in favour of obtaining such statistics as soon as possible: the later we are in foreign countries for our purchases, the less chance we have to obtain the grain. Our harvest here is about two months later than the harvest in Italy or France, and it is natural that, immediately as these countries find their crops to be very deficient, they should at once send for supplies, and as they are nearer to the Danube, from Marseilles for instance, than we are, they get their supplies provided for from the Danube, Alexandria, and other places, before almost we know ourselves that we also want them. This of course affects very materially the commerce of the country. The influence of such suddenness of rise in the price of grain, together with the rise of freight, has also great influence on the rise or on the decline of the prices of other articles of consumption here, because the more we have to pay for grain, the less we have to bestow upon other articles, and our relations with such countries from whom we receive such articles of luxury; our exports are also affected from the same causes, and thus it acts and re-acts in many ways. I have thus contented myself in indicating what are the evils resulting from the present want of correct agricultural statistics. I know that estimates of the harvest are constantly made by private merchants and farmers, and these are abundantly published in the *Mark Lane Express*, and other papers; yet these estimates are generally uncertain, and are often made by interested parties. Indeed the conflicting nature of such information is often the source of extraordinary fluctuation of prices. I have not detailed the direct benefits of agricultural statistics, whether of those referring to the number of acres under cultivation, and under the several crops, to the estimate annual yield, or to periodical statistics of agriculture on an extensive plan. I believe they are likely to prevent great fluctuation of prices; to diminish the speculative character attached to all transactions in grain, and to enable us to obtain the necessary supplies for the year from foreign countries at lower rates, and with greater ease; and I believe, moreover, that such statistics will have a further important effect in calling forth greater energy among our farmers in the application of science into agriculture: in improving all the processes of cultivation, and in extending materially the agricultural resources of the country. I consider the farmer stands upon the same level as the merchants, because, no doubt, whilst the merchants have often to pay dearer for grain on account of their ignorance, the farmer often sells a larger quantity in the first instance at lower prices than he was justified in doing; and this is especially the case with those who, being least acquainted with the general state of the country, go on selling; and, perhaps, after they have sold all they have, they find that those who have been fortunate enough to hold get double for their produce. If information were more general, they would only be disposed to sell such portions as they are under necessity of selling, and that would enable them all to participate in the rise when that rise happens.

The witness is then examined on the subject of the imports of grain and its variation in price. He says:—

And there is another curious observation out of these prices; it appears that the months when the highest prices ruled were mostly July and August; for this there may be two reasons. It may arise from sudden deficiency in the quantities of grain on hand of the old crop, from the non-arrival of foreign grain, or from the bad prospects of the next harvest. In many cases where a sudden rise in August takes place from a sudden want, it shows a want of agricultural statistics: because if we knew it sooner we should not be all on a sudden finding our rick-yards empty, and all on a sudden wanting extra supplies from abroad. I presume if we had agricultural statistics in time, the rise would not take place in August, but would take place in March or April, or earlier still, and so on progressively from the commencement of the year, immediately, in fact, as the harvest operations are over. In 1847 the highest was in June; in 1842, 1849 and 1851 the highest price was in July; in 1841, 1843 and 1850 the highest prices were in August. I am not now specifying what were the reasons, as I said it may have arisen from bad prospects of the crops in this or other countries, and again from the scanty remainder of the former years. As to the lowest prices in 1840, 1841, 1842, 1847, 1849, and 1852, the lowest prices ruled in December and January. If we had agricultural statistics after a bad harvest, prices would generally begin to rise in December and January, and yet these are the months when generally prices ruled the lowest. There are reasons to believe that in those months prices under ordinary circumstances would rule the lowest, because farmers have then generally larger quantities on hand, and they bring it freely to market; at the same time, if agricultural statistics were to point out that prices during the whole year are likely to rule higher than immediately after the harvest, the farmer and speculator would at once become acquainted with it; and the one would keep the grain back, and the other would give higher prices, and so would prevent prices ruling very low up to a very considerably advanced period. As it is, all on a sudden, the harvest may be found to have been very deficient; and instead of having abundance at home, we are at the last moment reduced to the necessity of obtaining from abroad very large quantities at any prices it can be had.

ON FATTENING POULTRY.

PRIZE ESSAY.

[The following Paper is taken from the Journal of the Yorkshire Agricultural Society.]

* * * * * "And Chauntecleere so free,
Song merrier than the Mermaid in the see."—CHAUCER.

The consideration of the best method of Fattening Live Stock, of any description, may be most advantageously arranged under two heads, namely, the scientific principles which have been ascertained respecting feeding; and their practical application as verified by experience.

In the following essay these subjects will be treated in separate chapters; so that those readers who require merely the practical details may omit the consideration of the scientific truths on which they are based.

CHAPTER I.—THE PRINCIPLES OF FEEDING.

SECTION I.—*The Purposes served by Food.*

The purposes served by food, when taken into the body, are of several distinct kinds, and may be spoken of as—

1. The production of animal warmth.
2. The supply of the materials required for the growth and waste of the muscles, &c.
3. The supply of the mineral and saline substances contained in the body.

4. The supply of the waste or increase of fat.

The warmth natural to living animals depends upon the consumption of a certain portion of the food in the process of breathing; the substances consumed in this manner are chiefly those which contain a large quantity of carbon, which passes off in the breath, in the form of carbonic acid.

The most important warmth-giving foods are, starch, sugar, gum, the softer fibres of plants, and oily or fatty substances; as the natural warmth of an animal in health remains the same at all times, it necessarily follows that a larger supply of warmth-giving food is required in cold situations than in warm ones.

During motion, or under excitement of any kind, the breathing is hastened, and consequently a larger amount of carbon is thrown off by the lungs. In quietude and sleep, or the contrary, the breathing is slower, and the quantity of food consumed in this manner is lessened. These circumstances will render evident the utility of keeping fattening animals in a house of moderately warm temperature, and one sufficiently quiet and darkened to conduce to rest and sleep.

To supply the materials of the growth of young animals, and repair the waste arising from the daily action of the limbs, and from other causes, a second variety of food is required; for the starch and other substances before enumerated have been proved, by direct experiment, to have not the slightest action in supplying these wants. Substances possessing this power may be termed flesh-forming foods. The most important are the gluten, and similar substances, existing in variable quantities in different grains; and, in larger proportion, in the varieties of Pulse, as Beans, Peas, &c.; and in the materials which form the solid parts of the flesh of animals, of eggs, of milk, &c. In consequence of their containing the element of nitrogen, which is wanting in the other varieties of food, these flesh-forming substances are frequently termed nitrogenous foods; whilst the fat-forming and warmth-giving are called carbonaceous foods.

The mineral and the saline substances contained in the bones, and in other parts of the bodies of animals, occur in larger proportion in the bran than in the inner part of the grain. A due supply of bone-making and saline materials is absolutely requisite to the growth of a healthy animal; as, if wanting in the food, the bones become soft, and the general health speedily fails.

In reference to the present subject, those substances which supply the materials for replacing the waste or the increase of fat are the most important. It is still a point unsettled, amongst scientific authorities, whether the starchy materials before spoken of as warmth-giving food, are, or are not capable of being converted, by the living forces of the body, into fat; although there is but little doubt that under favourable circumstances they are so, but it is unquestioned that where it is desired to fatten animals rapidly (or supply fat to be consumed in generating warmth, as is necessary in all cold regions), it is the absolute requisite that the food eaten should contain oily and fatty matters which can be readily absorbed by the digestive organs, and either stored up or applied to the immediate wants of the body. There appears no doubt but that the fatty materials in the food are rapidly absorbed by the body without undergoing much alteration, therefore, the nature of the food influences very greatly the character of the fat; and, not to seek for examples beyond the animals whose fattening is at present under consideration, the writer knows of an extensive feeder of geese, who always sends his birds to market in an excessively fat condition, but which nevertheless do not command the prices paid for some others in a less fatted state, from the very soft and oily character of the fat, and its being known to lose excessively in cooking. This feeder keeps his process of feeding a secret; but there is little doubt but that oil-cake or Linseed enters largely into his dietary. The rapid fattening effects of cod liver oil on men and animals prove also, that fatty substances can be rapidly assimilated by the vital powers; and the following extract from the 11th volume of the "Pharmaceutical Journal" substantiates the fact, that they are absorbed without undergoing much change:—

"A quantity of refuse cod livers were sent into the country, and turned under some rubbish for the purpose of forming manure. Some time after several pigs discovered the treasure, and fed extensively upon it; although not put up to fatten they became in very high condition—so much so that they were killed without any further preparation. On dressing them it was found that the fat was yellow, and the flesh very peculiar; during cooking it gave out a very strong smell, similar to that of boiled cod livers, and was so offensive that it was unfit for food; in fact it was saturated with the oil, which even exuded from the lean when pressed. The fat of the pork did not solidify, but was soft, and smelt like rancid cod liver; even the lungs and the liver appeared saturated with oil; the hams had the appearance of having been soaked in that liquid, and could not be made to take the salt. This circumstance appears to prove that the fatty matters are absorbed without their sensible qualities being altered; the liquid character and rancid flavour of the cod liver oil affecting the fat of the pork."

(To be continued.)

Home Correspondence.

Steam Cultivation.—The readers of the *Gazette* must not consider (until they shall have heard me out) that I am about to make a retrograde movement in field mechanics, when I shall show them they must in a measure return to that simplicity of operation from which they are fast departing, before they can advantageously employ the power of steam in place of the living horse. Agriculture in the field is remarkable beyond all other arts for its simplicity; such being the fact, you must agree with me there need not be the least necessity to farm by algebra when it can be done by simple arithmetic. The business of farming may be difficult, but agricultural processes ever have been and are simple enough. I once knew a "promoted scarecrow" who could perform every operation connected with tillage in first-rate style; and I also knew a farmer who could not write his name, yet made a fortune off 500 acres of land. Hence agriculture must be a simple, not an elaborate practice in its general principles; as such I wish your readers to regard it, because I shall have occasion to make some (apparently) very simple overtures for the purpose of bringing my "method" of tilling the soil, sowing the seeds, and hoeing the weeds, &c., into practical operation. By turning to my last letter, p. 573, it will be seen I adduced certain examples to show that Nature, when she desires to execute as much work as possible in the least time and with the least expenditure of labour or *matériel*, invariably includes the work to be done within a circular figure. It now remains to me to demonstrate how and why the work of tillage or cultivation, to be offered to the steam-engine to execute, should also be included within a circle of a definite and practicable area. The point is difficult to elucidate by mere words, I admit—being an argument of a practical, or rather material, nature, it requires to be shown by practical illustration in the field; that is, to explain myself convincingly, I ought to have the power of addressing the eye, rather than the understanding; this cannot be, therefore we must make the best of it, bearing in mind that he who is not convinced at a glance will never be convinced by a multiplicity of words. The proposition is this, viz., we want to do a great deal of work in a very short time, and for very little money; the power we propose to employ is that of steam; the material we have to operate upon is an extensive plane surface. Now as we know we cannot act upon a vast plane surface all at once by mechanic means, we will without hesitation divide it into parts, and take a portion, say a half-acre (or, entire acre); this is strictly admissible, because "What is a farm?" Why it is an acre of land, or, an aggregation of acres from 5 to 500, but all as separate and distinct, the one from the other, as much as our fields are, if we choose to view it so. Therefore, my proposal is to cultivate only one acre of land by steam-power; knowing full well that if we fulfil the required conditions in executing that one acre, we can by a repetition of the same means accomplish 500 acres or any greater number. It will be understood in this letter we are endeavouring to find out the method of application—not the machine which is to till the land. When we shall have first found out the method or railway (to speak figuratively), then we will describe the tillage-machine or locomotive which is to run, or operate according to the nature or requirements of the method discovered. We have here a circle and a parallellogram, each of which contains half an acre of land.

The parallelogram exemplifies the angular or square method by which tillage mechanism is now worked, and the circle shows the method by which I propose to grind up the soil so as to obtain a seed-bed, &c. Now let us consider the relative advantage of the two systems. The first condition required from a steam cultivator was that it shall do more work in less time; hence, suppose the motive power employed is situate at B on the circumference of the circle, the length of the line representing the circumference will be (in round numbers) 168 linear yards; now arises the question, what time will it take a cart-horse or a steam-engine moving at horse pace to travel this distance? The answer will be 2½ minutes; hence, if we can (hereafter) show it is practicable to construct a steam tillage machine, which shall extend its arm from the motive power at B to a fixed point (point d'appui) at A, in the centre of the circle, and be connected therewith, we know to a certainty that the traversing movement of the engine at B would cause mechanism to sweep over the entire surface included within the circle in the same period of time as its own description; and that, as a consequence, proper mechanism being provided, we could execute all the customary processes of tillage over half an acre of land in 2½ minutes of time. Now this rate of operating would perfectly fulfil the condition we proposed, viz., of doing more work in less time than is now done. Therefore it is proven that a circular movement round a fixed point, the power moving having connection with that point, is the method by which we can fulfil the condition of time. Let us now examine the parallelogram, which also contains half an acre, and exemplifies the present method of operating. Owing to the want of a point of attachment, or fixed point for machinery to work from, and also from the extreme difficulty of turning at the headlands, to complete the "bout," our present field mechanism is limited (as a rule) to 9 feet. Now suppose each of the lines engraved in the parallelogram to be 336 yards long, or twice the length of the circumference of the circle, it will follow that by the time a machine can be dragged 168 yards, or one quarter of one "bout," the steam machine worked on the circular method would have executed in the same period of time an entire half acre of land. Here is economy of "time" in operating on extensive surfaces by machinery! Who can object to it? Who can object to the obtaining such great results by so simple a change in method? Let me observe, if a field were to be worked up by a steam tillage machine in separate portions (half acres or acres), of course it would present an unusual appearance; in fact it would resemble a lot of "molehills" or beautifully pulverised circular areas, such being the visible and practical result of my method. I hope I may claim the hearty support of "Talpa," because he has, with that prescience for which he is remarkable, in his letters alluded to this probable "molehill" method of cultivation:* he writes, "There's the tiny mole, a fierce sub-navigator in his way, but his track turns up some pretty cultivation, it only wants spreading far and wide; it's not so wise to throttle him as you think; I grieve to see him hanging gibbetted, his clever paddles stopped by cruel ignorance. For he is your only granulation-master; he taught us drainage and sub-cultivation, and we shall learn of him another and a greater lesson some day, and call him a prophet." It will be evident from the above quotation that "Talpa" evidently discerns that the "molehill" method of pulverisation presents the finest and most perfect tillage imaginable; although his mind instructed him of this fact, yet he might not discern how the like could be effected by mechanical means, but this will not detract from his merit. I also claim the suffrage of the gardener. For years past writers in the *Gazette* have talked about and stated that they desired "horticultural agriculture." Now we propose to divide a field into half acre or acre plots, and to pulverise them mechanically by steam-power; such being the case, what expression (figuratively) would the gardener apply? Why he would call it his "flower-pot" system on a larger scale. And what better than that? Surely if he with his weak hands can pulverise the soil and grow his finest plants in a 2-feet flower pot, we could grow our plants far finer than is now the case within the area of an half acre, or whole acre "pots," or "molehills," tilled by a steam-engine! Of what use is it talking about "horticultural steam-agriculture," unless some farmer boldly steps forth to try it? I also ask the honest opinion of the very small farmer; for it has long been notorious that the smaller a man's plot of land is the more he will grow upon it in comparison with larger. On first inspection of my "method" I shall be charged with an apparent loss of land, through the intervals between the circles; but here (although it requires no ghost to see there need be no loss, unless the farmer chooses), I claim the testimony of Mr. Smith, of Lois-Weedon, the skilful disciple of Tull, as to whether there be any real loss by having intervals (or interstitial spaces) among growing plants; he demonstrates by his practice that from the fact of his free use of the "interval" among growing crops, it enables him to grow more, and also to grow the same crop year after year, with impunity, on the same land; and he attributes it entirely to the use of the "interval"—hence we may consider it as proven that blank spaces among growing crops instead of being a disadvantage may be turned into a real profit. *Charles Burcham, London.*

Thin Seeding.—The very intelligent master of the Newmarket Union sowed on 8th September last one grain of Wheat of the crop 1852. It threw up seven spires, which were transplanted about 14th November. On about the 20th August, when the crop was gathered, there were 131 heads; these contained 5700 grains and a few over. The yield more than filled a tumbler, and the weight of it was 9¼ oz. The master counted and weighed the grains himself. I enclose a few grains as a sample. Contrast this with the ordinary yield. Two bushels per acre would be considered a thin sowing, and 40 bushels per acre a good yield—in other words 20 fold; here we have 5700 fold. On a former occasion he sowed one grain in September, and transplanted the spires in November; and again in February; and the yield then was above 6500; but he has not the exact particulars. Again, in order to see whether old or new Wheat threw up the strongest spires, he sowed on the 25th August, one grain of the crop 1851; one do. 1852; one do. 1853; one do. 1854; one do. 1855. And the relative heights of the species on the 7th September were—1851, 5½ inches; 1852, 4⅞; 1853, 5; 1854, 4⅜; 1855, 3¼—the spires from the old seed taller and stronger. *I. H. W.*

Case of the "Collins'."—In a severe comment made by the *Times* on the punishment of two labourers who left their work to go and see a review, no mention of the hay-spoiling is made; now, if labourers can leave their work at a most critical time, and only lose their day's wage, farming cannot be carried on. Only suppose a score of Irish labourers employed in a hay-field carrying hay, and a storm coming on; what is the loss of one day or a week's wages compared to the loss of a crop! All other trades are protected from such accidents, pray why should not farmers! There was, moreover, in this case a conspiracy, or what would in a manufacturing district amount to it, namely, in the man persuading the boy to leave work. *No Cockney.* [The offence was sanctioned or forgiven or condoned by the master

* *Agricultural Gazette*, No. 15 1850.

accepting the services of the men after their return, until his crop was secured. To try and punish them after that was a mean-spirited thing in the master, and that he should succeed in his attempt proves, under the circumstances, so far as they have been published, unsound judgment in the magistrate.]

Societies.

TYNESIDE, *August* 28.—*Demands upon the Farmer.*—At this Society's show held at Hexham, Mr. Grey, of Bilston, stated the two great requirements made of the farmer by the wants of the age. 1. To increase the produce of his land. 2. To diminish the expenditure by which that produce is obtained. Owing to emigration, to the distressing war in which we were engaged, and to other circumstances, there had been a falling off in the supply of labourers—a destitution in the labour market; and if more produce was to be extorted from the soil it must be by liberality and judgment in its cultivation, and by (what it was the main object of this society's exhibitions to promote) the introduction of the most productive and profitable stock. To agricultural societies like the Tyneside much gratitude was due for the stimulus which they had given to increased production; and they must all rejoice that the recent meeting of the Royal Society in Carlisle had proved a most successful one. Many important machines had been exhibited and tried. The reaping machine, now so much a desideratum, had not, so far, been productive of any great effects in agriculture. Many failures and disappointments had marked the persevering efforts to bring it into use. In the present harvest, however, such had been the weather for some time past, that farmers were not in a condition to use any other machine than the old-fashioned one of the sickle—not even the scythe. But if, at Carlisle, no decided step had been gained as to the reaper, other machines had been tried successfully and conclusively. The chairman had referred to the threshing machine; and truly it was surprising, as Mr. Errington had remarked, to see farmers—large farmers—straining and wearing the sinews of their horses, when a little fuel and a little steam would do the work so much more effectually and economically. (Hear, hear.) In this respect, however, progress was being made, for farmers were mending their ways; and it was important to know one economical result of a competition between two threshing machines at Carlisle—namely, that the one consumed one-third less fuel than the other in doing the same amount of work. The more such machines were used, the more they would be improved. Then, again, there was the plough. It was found that a plough made by that eminent manufacturer, Ransome, did its work with one-third less power than another, whose work was done about as well. Was not that an important fact? If two ploughs of one kind could do the work of three of another, every farmer must see the extraordinary saving which accompanied the use of the superior implement; or if one plough could turn up a furrow of 9 inches, and the other a furrow of only 6, was not the former a great desideratum as compared with the other? The importance of a deep cultivation of the soil had often been impressed on the agricultural mind; and in seeking a deep foundation for their manures, the most economical means should be used. If, to vary the illustration, two acres could be made, without additional cost, to bear the produce of three, was not that preferable to the cultivation of 3 acres, and the attainment of the produce only of the two? Many desirable things have been brought under notice at Carlisle; and one thing, which was very desirable, was the collection of the best possible information as to the science and practice of agriculture. When, however, prophets came from a distance to lecture the farmers of any district on their usages, they should be sure that they knew what they were talking about. The farmers of the north had been called to account for their deficiency in hay-making. They were told that their hay should have been in stack three days after it was cut, and that the antiquated practice of putting hay in pikes should be discarded. He should like teachers of agriculture to come to the north, and serve an apprenticeship in our climate, before they again gave lectures on hay-making. They would soon find their fallacies overthrown by the seasons. Mr. Mechi lived in a dry climate. His farm was not watered by one-half—probably not one-third—the rain which fell in the north of England. Were he to make hay in the north as he made it in the south, he would find himself in possession of a mass of rottenness. Mr. Mechi farmed a poor soil, which, generously dealt with, yielded large crops. The same system, if followed here, as Mr. Mechi recommended, would prove ruinous. He (Mr. Grey) farmed a little himself, and he had tried various experiments. He had applied artificial manures in the manner advised. And what was the result? Heavy rains had fallen, and his manures were washed away and lost. The produce was inferior to that of his lighter crops. He was not one who advised the farmer to be niggardly in his management, but only to be judicious as well as liberal. Those gentlemen who came into the north—in a spirit that could not be too highly commended—to instruct the farmers of the district in agriculture, should be told that their systems, however good and profitable in Surrey or Cambridge, or even on the Welds of Yorkshire, were not applicable to this more northern part of England, or to Tweedside. Were they to do in the north as they did in the south, they would run great risk of over-doing it, and of inflicting injury on themselves.

MANCHESTER AND LIVERPOOL.—At the annual meeting of this Society, held last week, Lord Stanley, who presided, made the following remarks in reference to the history and progress of agriculture:—

England ranks among the first of the nations of the earth. We have intelligence, we have industry, we have wealth, we have public order, we have science. One requisite, and one thing only is wanting to our greatness. Now, what is that weak point? I will tell you. It is narrow area and circumscribed territory. No nation materially and morally so great is territorially confined within such narrow limits. (Hear.) It appears that we cannot extend the national area; there are no unoccupied lands near us; colonisation at home is impossible, and the days of conquest are gone by; and the only resource, therefore, that remains to us, if we cannot extend our territory, and if at the same time its smallness is the only limit of our power as a nation—is the principal limit of our power as a nation—to do what is equivalent to extending our territory, by increasing the productive power of the soil within the same area. It is for that object—an object within our power by many applications of the scientific means known to us all to attain—it is for this object that nations have quarrelled, that battles have been fought, that blood has been shed, that countless treasure has been wasted; and that object, I say, is within our power to obtain by applying the resources of science. I do not speak of continental competition; from that I fear little, but there is another kind of competition to which we are even now exposed, and to which we shall be more exposed than we are—I mean to that of the new world. If we are permanently to hold our own against countries like the United States and Canada, against countries where you can buy land out and out for little more than one-fourth of the price per acre for which you rent it in this country—I say our only chance, our only hope of retaining our national position as against this new competition—the only chance of holding our heads above water—is to apply mechanical aid and use the resources of science to an extent of which we have never hitherto dreamt. Now, what are the practical changes necessary to bring about that state of things? There is one particularly which I would venture to lay down with all confidence. I think that land in this country ought to be easier and freer to buy and sell than it is. You may be told there are legal difficulties in the way. So there are, no doubt, but those legal difficulties are comparatively slight. It is not there the real obstacle, the real impediment lies; it is a social difficulty, and not a legal difficulty. The community has the right to say to every one, either use your property profitably yourself or let others use it for you. I am not now talking of a legal remedy; I do not want an Encumbered Estate Act for England—that is not necessary here, whatever it may be elsewhere; but I do want and I do desire to see that every landlord shall be an encumbered estate court in himself. Until that is done you will not place the tenure of land, you will not place the agriculture of this country, on a sound and rational footing (applause). There are other points which I would pass over lightly. Mr. Mechi told this society last year that it was absurd to send to the Pacific, a distance of 10,000 miles, to buy bird dung for manure, while thousands of tons of the natural manure of this country were poisoning our rivers and choking our seas. But I suppose in that we are all agreed; and so far, as it is hardly a practical question, no single landowner or farmer can do much in that respect. The towns must take it in hand. I am told that experiments have been made; I am told that those experiments have not been always so successful as they deserve to be. If that is so, more is the pity. But the principle is, notwithstanding, a right and a sound one, and whatever may now be wrong in the details will doubtless come right before long. One word you will expect from me on that which is, perhaps, a great feature of our age in all the departments of labour—I mean the application of machinery. No doubt, when you apply mechanical power to agriculture you have to encounter many difficulties which do not exist in other cases and in other business operations. In the factory or in the town you bring the material on which you want to operate to the machine; but on the farm you must generally bring the machinery to the material. This is no doubt a great drawback and a great disadvantage; but, notwithstanding its existence, I believe firmly that at no distant period inanimate labour will have almost, if not entirely, superseded brute labour of every kind. That will be, whenever it takes place, not merely a mechanical, not merely an industrial, but a moral and social change, and which we can hardly overrate. (Hear, hear.) An obstacle to the more extensive introduction of machinery here is the comparative smallness of our holdings. It is so costly that very few of our farmers can purchase it to a large extent for themselves. If, therefore, it is to be introduced practically to the extent to which it may be, and ought to be, I believe it will be done in this way—it must be provided either by the landlords or by some person letting it out to the tenants, who must pay a rent for the use of it to the owners of the machinery.

Notices to Correspondents.

BOKHARA CLOVER SEED: *Constant Reader.* Any of our principal agricultural seedsmen will supply you.

BRAN: *X.* Professor Johnstone gives the following analysis:—Water, 13.1; albumen, 19.3; oil, 4.7; husk and a little starch, 55.6; ash, 7.3.

CHURN: *Melinda.* The common box churn is as good as any for so small a dairy.

GUANITE: *Anon.* We do not know it.

GRASSES: *Subscriber.* Sow in March next, along with a thin seeding of Barley, 1 lb. of Alopecurus pratensis, 1 lb. of Avena flavescens, 2 lbs. of Dactylis glomerata, 2 lbs. of Festuca duriuscula, 1 lb. of F. heterophylla, 2 lbs. of F. rubra, 3 lbs. of Lolium italicum, 5 lbs. of L. perenne, 2 lbs. of Poa nemoralis, 1 lb. of P. pratensis, 1 lb. of Medicago lupulina, 3 lbs. of Trifolium pratense perenne, and 4 lbs. of T. repens; in all, 28 lbs. per acre.

GUANO: *Sub.* First introduced to Europe by Humboldt. Who has the credit of inducing the importation for agricultural purposes we do not know. Mr. Skirving, of Liverpool, if we mistake not, was one of the earliest importers or users of it.

NEXT FALKIRK TRYST: *Eboracum.* October 14 and 15.

OSIERS: *A Sub.* There is no work specially on the subject that we know, but most systematic works on agriculture give instructions. See article Osier in Blackie's "Cyclopedia of Agriculture;" or look at instructions given some weeks ago in this Journal. We should not like the bottom of a pond for an Osier bed. Land that will hold water is by no means the best for such a purpose.

TRIFOLIUM INCARNATUM: *Mr. Powell* should sow 20 lbs. per acre now, or just previous to a change in the present dry weather; sowing it broadcast over any *clean* stubble, having first harrowed it. A harrowing after sowing is all the cultivation it needs, and manure may be applied to it broadcast in spring. The land must be clean and hard.—*J. P.* The plant is safe enough. The shedding of the seed will furnish young plants against next year.

WEEDS: *Novice.* Your plants are a Polygonum and an Equisetum—Knot-grass and Horsetail—both common on sandy soils; the latter especially, when wet. Fallow crops well cultivated will get rid of them ultimately. As to lime, we would apply it at the rate of two "Scotch cart-loads" per acre, making into a compost with vegetable mould of any kind, as ditch cleanings, turf, &c. An old compost of this sort might be applied on the young Clover in autumn, if you intend to grow Clover; and if not, apply it on any stubble before ploughing it in for winter.

MAPPIN'S PRUNING KNIVES IN EVERY VARIETY,
WARRANTED GOOD BY THE MAKERS.

JOSEPH MAPPIN AND BROTHERS, QUEEN'S CUTLERY WORKS, Sheffield; and 37, Moorgate Street, London. Drawings forwarded by post.

WARNER'S 4½-inch IMPROVED LIQUID MANURE PUMP, with Ball Valve, fitted with 1½ inch Brass Union for attaching flexible suction, with strong wrought iron Straps for screwing on to any ordinary Water-butt or Cart, as shown in drawing.

Price of Pump and Union, 50*s.*

1½-inch Flexible Rubber and Canvas Suction for ditto, 3*s.* 6*d.* per foot.

1½ Gutta Percha Suction, 1*s.* 6*d.* per foot.

WARNER'S IMPROVED LIQUID MANURE OR GENERAL PORTABLE PUMP.

The valve is a ball of imperishable material, and cannot clog in action. The barrel is of galvanised iron, not likely to corrode, and can be raised or lowered at pleasure. The legs will fold together, and the whole may be carried on shoulder to any pond or tank required.

Price of 4½ in. Pump, with legs, 3*l.* 3*s.* The barrel is 27½ in. long, and the legs are 5 ft. high.

1½ inch Gutta Percha Suction Pipe, 1*s.* 6*d.* per foot.

1½ inch Flexible Rubber and Canvas Suction Pipe, 3*s.* 6*d.* per foot.

May be obtained of any Ironmonger or Plumber in town or country, at the above prices, or of the Patentees and Manufacturers, JOHN WARNER & SONS, 8, Crescent, Jewin Street, London.

Every description of Machinery for Raising Water, by means of Wheels, Rams, Deep Well Pumps, &c.; also Fire and Garden Engines, &c.—Engravings sent on application.

WARNER'S PATENT VIBRATING STANDARD PUMPS.

PATENT CAST-IRON PUMPS, for the use of Farms, Cottages, Manure Tanks, and Wells of a depth not exceeding 30 feet.

Diameter of Barrel	Length of Barrel, under nose.		£	s.	d.
2½ in.	short 1 ft. 7 in.	Fitted for lead,	1	12	0
2½ „	long 3 „ 3 „	gutta percha,	1	15	0
3 „	ditto 3 „ 6 „	or cast iron	2	12	0
3½ „	ditto 3 „ 6 „	flanged pipe,	2	18	0
4 „	ditto 3 „ 6 „	as required.	3	5	0
2½ „	short, with 15 feet of Lead Pipe attached, and Bolts and Nuts ready for fixing		2	12	0
2½ in.	long ditto ditto ditto		2	15	0

The short barrel Pump is very convenient for fixing in situations of limited height and space, for the supply of coppers and sinks in Wash-houses with soft water from underground tanks, or in Hot, Forcing, and Plant Houses; they may be fixed, when desired, under the stage.

May be obtained of any Ironmonger or Plumber in Town or Country, at the above prices, or of the Patentees and Manufacturers, JOHN WARNER AND SONS, 8, Crescent, Jewin Street, London.

Every description of Machinery for Raising Water, by means of Wheels, Rams, Deep Well Pumps, &c.; also Fire and Garden Engines, &c. &c.—Engravings sent on application.

WARNER'S SWING WATER-BARROW (TO HOLD THIRTY GALLONS)

Is intended for all large Establishments where much watering is done by the watering-pot. By its use much time and labour of the Gardener are saved, particularly where the Tank, Pond, or Pump, is at a distance from the garden. May be obtained of any Ironmonger in town or country for 3*l.* 3*s.*

Manufactured by
JOHN WARNER & SONS, 8, Crescent, Jewin Street, London.

JOHN WARNER AND SONS, Crescent, Jewin Street, London.
GALVANISED IRON TUB GARDEN ENGINE,
WITH WARNER'S REGISTERED SPREADER,

is strongly recommended, for durability and low price, viz., 2*l.* 19*s.*, to hold 10 gallons.

Larger sizes in wood or iron, viz., 14 gals., 24 gals., & 35 gals. May be obtained of any Ironmonger or Plumber in town or country, or of the Patentees and Manufacturers, as also Machinery of all kinds for raising Water from any depth to any height by Steam, Horse, or Manual Power. Prices sent on application. Syringes of various constructions and sizes from 9*s.* upwards. Metallic String from 5*d.* to 1*s.* 8*d.* per lb.

IRON GATES, HURDLES, FENCING, ETC.

J. BULLOCK and CO., Hope Iron Works, Primrose Street, Bishopsgate, Ironfounders and manufacturers of the above; also Verandahs, Conservatories, Staircases, Iron Roofs, &c. N.B. Iron and Wire Fences fixed in all parts of the country by competent workmen, or the materials supplied painted or galvanised ready for fixing, and packed for shipment. Estimates on application.

BY HER MAJESTY'S ROYAL LETTERS PATENT.

E. DENCH, Patent Hothouse Works, King's Road, Chelsea.

These Patent Horticultural Buildings are superior to all others, wood being used for the frame work, but covered with Galvanised Iron Sashes, and all completed for 1s. 3d. per foot super. Hundreds of references can be given, and Printed Price Lists sent.

BY SPECIAL APPOINTMENT To Her MAJESTY THE QUEEN.

WILLIAM WALKER, Victoria Foundry, Walmgate, York.

Manufacturer of Hot Water Apparatus for Heating Greenhouses, &c.
Garden Rollers, Handglass Frames
Iron Fencing and Gates
Liquid Manure Pumps
Iron Palisading, Iron Bedsteads
Galvanised Game Netting
Stable Packs and Mangers
Kitchen Ranges and Smoke Jacks on a superior principle

Every Description of Plain and Ornamental Cast and Wrought Iron Work.

J. OVERALL begs to inform the Nobility, Gentry, Nurserymen, and others requiring Horticultural Buildings, Lights, and Frames, that by intrusting their orders to him, they may depend upon first-class workmanship and good materials at the most economical prices.

J. Overall, Horticultural Builder, 16, Shacklewell Lane, near Kingsland, London.

HORTICULTURE IN ALL ITS BRANCHES.

JOHN WEEKS & Co., King's Road, Chelsea,

HOTHOUSE BUILDERS.

THE NOBILITY and GENTRY about to erect Horticultural Buildings, or fix Hot-water Apparatus, will find at our Horticultural Establishment and Hothouse Works, King's Road, Chelsea, an extensive variety of Hothouses, Greenhouses, Conservatories, Pits, &c., erected, and in full operation, combining all modern improvements, so that a lady or gentleman can select the description of House best adapted for every required purpose.

The HOT-WATER APPARATUS, which passes through all the Houses and Pits affording both top and bottom heat, is in constant operation and particularly worthy of attention.

Many of the Houses and Pits are of wide and lofty dimensions, and together equal in length 1000 feet. They are all effectually heated by *one boiler*, which, during the severe winter months does not cost in labour and fuel more than 3s. 8d. per day, and the apparatus is so arranged that each House or Pit may be heated separately and to the required temperature. The splendid collections of Stove and Greenhouse Plants are also in the highest state of cultivation, and for sale at very low prices. Also a fine collection of strong Grape Vines in pots, from eyes, all the best sorts.

Plans, Models, and Estimates of Horticultural Buildings; also Catalogues of Plants, Vines, Seeds, &c., forwarded on application to John Weeks & Co., King's Road, Chelsea, London.

HEATING BY HOT WATER.

JOHN WEEKS & Co., King's Road, Chelsea, Horticultural Builders and Hot Water Apparatus Manufacturers. At our two Establishments horticultural science is fully carried out in all its branches.

The accompanying sketch represents our Improved Boiler. These Boilers are very powerful, durable, and economical. The whole of our extensive nursery establishment is heated by *one boiler*, measuring only 5 ft. by 3 ft. 6 in. The Houses heated consist of forcing-houses of various descriptions, many of them are of wide and lofty dimensions, in length 1000 ft., and exposing to the atmosphere upwards of 16,000 superficial feet of glass. During the late severe winter it only cost us 3s. per day for fuel, and we had more than a sufficient command of heat. Any number of forcing-houses can be heated by *one of our Boilers*, and any part regulated at pleasure. Plans, Models, and Estimates of Horticultural Buildings, or Heating by Hot Water, forwarded on application.

John Weeks & Co., King's Road, Chelsea, London.

HORTICULTURAL WORKS AND HOT-WATER APPARATUS MANUFACTORY,
Kensal Green, Harrow Road, London.

JOHN TAYLOR and SON beg to call the attention of the nobility and gentry to the very superior manner in which they Erect all kinds of Conservatories, Vineries, Greenhouses, &c., combining every improvement with elegance of design, and durability of materials and workmanship.

Their VENTILATING APPARATUS for the Fronts and Roofs of Houses has given the highest satisfaction. Churches, Chapels, Schools, Entrance Halls, Public Buildings, &c., heated with Hot-Water Apparatus in a most economical and efficient manner. J. T. & Son have great pleasure in referring to numbers of the nobility and gentry by whom they are extensively engaged.

GALVANISED WIRE GAME NETTING,
6d. per Yard, 2 Feet Wide.

BARNARD and BISHOP, Market Place, Norwich, in consequence of improvements in their machinery for the manufacture of the above article, have been enabled to make a great reduction in the prices.

	Galvanised.	Japanned iron.
2-inch mesh, 24 inches wide	6d. per yd.	4½d. per yd.
2-inch " strong, do.	8 "	6 "
2-inch " intermediate, do.	9½ "	7½ "
2-inch " extra strong, do.	11 "	9 "
1⅝-inch " 24 inches wide	7 "	5½ "
1⅝-inch " strong, do.	9 "	7 "
1⅝-inch " intermediate, do.	11 "	9 "
1⅝-inch " extra strong, do.	13 "	11 "

All the above kinds can be made of any width (under 8 feet), at proportionate prices. If the upper half is of a coarser mesh than the lower, it will reduce the prices one-fourth.

Strong Galvanised Poultry Netting, 10d. per yard; Galvanised Sparrow-proof Netting for Pheasantries, 3d. per square foot.

Illustrated Catalogues and Patterns forwarded by post. Delivered free of expense in London, Peterborough, Hull, or Newcastle. Manufacturers of Improved Strained Wire Cattle and Deer Fencing, Iron Hurdles, &c.

COTTAM and HALLEN have on Show, at their Repository, No. 2, Winsley Street, Oxford Street, London, a great variety of the following articles for the Garden, &c., at very low prices, viz.:—Garden Rollers, Cast-Iron Rickstands, Garden Engines, Mowing Machines, Garden Chairs, Superior Garden Tools of all kinds, Garden Vases and Pedestals in great variety, and a large assortment of Horticultural and Agricultural Implements.

Ornamental Wire Flower Stands, Pot Trainers, Rose Tree Guards, Flower Bordering, and every description of Wire Work, both plain and ornamental.

Hand Glass Frames, Cast and Wrought Iron Flower Stakes, Garden Arches, &c.

Strong Iron Hurdles, and best Wire for Strained Wire Fencing.

Hothouses, Conservatories, &c., made upon the most improved principle, either of Iron, or of Iron and Wood combined, which can be fixed complete, with Hot Water Apparatus, in any part of the Kingdom. Show Rooms at the Manufactory, 2, Winsley Street, Oxford Street, opposite the Pantheon, where every information may be obtained.

CAUTION.

PARKES' STEEL DIGGING FORKS AND DRAINING TOOLS.

Whereas very inferior descriptions of Steel Digging Forks are now manufactured and sold, and I have been informed that purchasers of the same have believed them to be the same as those manufactured by me, and to which the Royal Agricultural Society and numerous Agricultural Societies' prizes have been awarded, I hereby respectfully inform the public that every Fork manufactured by me is stamped with my trade mark "J. P.," and that Messrs. Burgess & Key, of No. 103, Newgate Street, London, are my sole Wholesale Agents, and I have authorised them to replace to the purchaser every Fork of my manufacture found defective; they will also on application send Wholesale and Retail Price Lists, &c., post free. Francis Parkes & Co.

FIRST PRIZE REAPING MACHINE.
NOTICE.

MESSRS. BURGESS and KEY beg respectfully to inform the public, and particularly the noblemen and gentlemen whose orders they were obliged to decline for this season on account of the manufacture not being fully arranged, that the Royal Agricultural Society's First Prize of 30l. was awarded to them for M'Cormick's Reaper, with their patent screw platform, at the trial at Leigh Court, near Bristol, upon the 29th of August last. Amongst the competing machines were Bell's, by Crosskill; Forbush's, exhibited by Mr. Palmer; and Hussey's, with tilting platform, by Wm. Dray & Co. The reports of farmers who have worked the machines during this present harvest, show that the average quantity of Wheat, Barley, and Oats which they cut was from 1¼ to 1½ acre per hour. Two horses work the machine with ease, and the only attendant required is a man or a boy to drive. Further particulars and prices sent free on application.—Burgess & Key, 103, Newgate Street; and 52, Little Britain, London.

PAXTON WORKS, SHEFFIELD.

SAYNOR and COOKE, Manufacturers of the celebrated Exhibition Prize PRUNING, BUDDING, and GRAFTING KNIVES, VINE and PRUNING SCISSORS, &c. These articles are Warranted to stand any kind of work, and to carry the keen edge of a razor without requiring to be sharpened so frequently as is usually necessary to obtain that sharp edge so requisite for the comfort and use of the practical gardener. The blades are also warranted to wear through to the back. They are used by all the eminent gardeners in England, Ireland, and Scotland, and can be purchased of any nurseryman or seedsman in the three kingdoms. Those who may not have used them are respectfully solicited to give them a trial. The Great Exhibition Prize Medal of 1851, and the Prize Medal of the Horticultural Society of Manchester, at their Show of 1854, was awarded to Saynor & Cooke for their superiority of material and workmanship. Established 1738.

PORTABLE STEAM THRESHING MACHINES.—The time run by the four highest Portable Steam Engines at the Carlisle Meeting of the Royal Agricultural Society in July last, with 14 lbs. of coal to the horse power, was:—

Tuxford & Sons	3 hours and	47 minutes.
Clayton & Co.	3	do.	27	do.
Barratt & Co.	3	do.	10	do.
Hornsby & Son's...	2	do.	54	do.

At the North Lincolnshire Society's meeting at Boston, in August last, Tuxford's and Hornsby's Engines again came into competition, when Hornsby's was again left a long way behind, with 14 lbs. of very inferior coal; the time run was:—

Tuxford & Sons	3 hours and	3 minutes.
Hornsby & Son's...	2	do.	43	do.

And had the testing apparatus which was supplied to the society from Grantham not indicated the steam pressure falsely by several pounds on the inch, the difference would have shown fully twice as much to the advantage of Tuxford & Sons' Engine.

At the recent trials of Threshing Machines at the Paris Universal Exhibition, M. Tresca, the Government Engineer, employed as the motive power one of Tuxford's Portable Machines which had been purchased by the French Government.

The Combined Threshing, Shaking, and Dressing Machine of Tuxford & Sons, was "highly commended" this year by the Royal Society at Carlisle; the Bath and West of England Society at Tiverton, &c.

Illustrated Catalogues, with prices, forwarded on application to Tuxford & Sons, Engineers, Boston, Lincolnshire.

AT MR. MECHI'S ESTABLISHMENTS, 112, Regent Street, 4, Leadenhall Street, and Crystal Palace, are exhibited the finest specimens of British manufactures in Dressing Cases, Work-boxes, Writing Cases, Dressing Bags, and other articles of utility or luxury. A separate department for Papier Maché Manufactures and Bagatelle Tables. Table Cutlery, Razors, Scissors, Penknives, Strops, Paste, &c. Shipping orders executed. Superior Hair and other Toilet Brushes.

NEW PATENT INVENTIONS FOR STABLE REQUISITES.

COTTAM AND HALLEN

HAVE made important additions to their original Invention of PATENT ENAMELLED MANGER RACK AND WATER TROUGH AT ONE FIXTURE, the main features of which are shown in the above engraving.

A *represents* the Patent Halter Guide and Collar Rein, the ball of which is taken to the back of the manger, works with ease and freedom up or down the guide bar, and is noiseless in its operation, as also a sure preventative against the most restive horse being cast in the stall.

B The Patent Portable Seed Box can be instantly detached from the Rack without disturbing the hay. The saving of the seed in a clean and useful state, either for agricultural purposes, or mixing with the food in the manger, is alone sufficient to claim general notice.

C The Seed Box detached, made of Galvanised Sheet Iron, light and durable.

D The Patent Saddle and Harness Bracket combined, can be used with great advantage in Harness Rooms, where space is an object, as the long portion of the bracket can be turned up out of the way when not in use.

COTTAM'S MANGERS are constructed in the best possible manner, both as to form and utility, are cleanly in appearance, durable, and impervious to infection; manufactured Plain, Galvanised, or Enamelled.

Improved Stable Guttering, with moveable safety covers, Sanitary Traps, Stable Pumps, Double Corner Mangers, Harness-room Appendages, and every article in Stable Furniture. Chaff Cutters and Oat Bruisers, kept on show at

COTTAM & HALLEN'S WORKS, 2, Winsley Street, Oxford Street, London.

WARMING AND VENTILATING.—Descriptive Catalogues and Estimates on application.

TO NURSERYMEN AND GARDENERS.

REIGATE SILVER SAND, 12*s.* per ton, 1*s.* 6*d.* per bushel, or 16*s.* per ton, delivered to the London Wharfs or Railways, or within a circuit of five miles. Sacks 2*s.* each. Kentish and other Peats and Loam of excellent quality. KENNARD BROTHERS, Swan Place, Old Kent Road.

PARKES' STEEL DIGGING FORKS & DRAINING TOOLS.

MESSRS. BURGESS AND KEY, as Mr. PARKES' Wholesale Agents for England, have always in stock a large assortment. These Forks and Tools are now in use by upwards of 1000 of the Nobility and Farmers, members of the Royal Agricultural Society, who pronounce them to be the best ever invented, and to facilitate labour at least 20 per cent. Price Lists sent free on application, and Illustrated Catalogue of the best Farm Implements, on receipt of eight postage stamps. 103, Newgate Street, London.

ROYAL AGRICULTURAL SOCIETY OF ENGLAND.
MEETING AT CARLISLE, JULY, 1855.
FIRST PRIZE AWARDED TO

RICHMOND AND CHANDLER'S No. 3 B CHAFF MACHINE, Price £7.

All the various modern Implements of Agriculture manufactured on the most scientific and improved principles, suitable for home use and exportation.—Address, RICHMOND & CHANDLER, Salford, Manchester; and 32, South John Street, Liverpool.
☞ CATALOGUES GRATIS.

ROYAL AGRICULTURAL SOCIETY OF ENGLAND.

AT THE NORWICH, GLOUCESTER, LINCOLN and CARLISLE SHOWS,
The Prize for the best LINSEED and CORN CRUSHER was awarded to E. R. & F. TURNER, St. Peter's Iron Works, Ipswich.

E. R. & F. TURNER invite the attention of Agriculturists and others to the following machines of their manufacture:—

ROLLER MILLS for Crushing Linseed, Oats, Barley, Malt, &c., of various sizes, with or without Bean-mill combined. The numerous prizes awarded these Mills by the Royal and other agricultural societies, render comment on their merits unnecessary.

PATENT COMBINED GRINDING and CRUSHING MILL for reducing Barley, &c., to a fine and soft meal, and crushing Oats, Linseed, &c., is strongly recommended for the variety of purposes to which it is applicable, and for its perfect and economic working. Price 25*l.*

CHAFF CUTTERS, for horse or steam power, cutting three lengths, with facility for changing the length of the cut almost momentarily, and other valuable improvements.

OILCAKE BREAKERS, made entirely of iron, with case-hardened teeth suitable for all descriptions of cake. Price 3*l.* 10*s.*

FIXED STEAM-ENGINES, on the horizontal direct acting principle. Long experience and attention to the practical working of steam-engines of every variety, have enabled the manufacturers to offer these Engines as inferior to none—either for efficiency, economy, or durability—and at prices which will be found comparatively low.

Superior Portable Steam-Engines and Threshing Machines, Horse-Power Threshing Machines, Circular Saw Tables, One Horse Carts, and various other Implements, are also manufactured at the above Works.

Illustrated Price Lists sent free on application.

HOSE PIPING.

WAITHMAN'S PATENT FLAX HOSE PIPING will sustain a greater pressure, is lighter, less bulky, will wear longer, and is about 60 per cent. cheaper than the leather hose pipe.

Manufactured only by WAITHMAN & Co., Bentham, Lancaster.

No. 1 QUALITY, INCHES IN DIAMETER AND PRICE PER YARD:—½, 9*d.*; ¾, 11*d.*; 1, 1*s.* 1*d.*; 1¼, 1*s.* 3*d.*; 1½, 1*s.* 5*d.*; 1¾, 1*s.* 7*d.*; 2, 1*s.* 9*d.*; 2¼, 2*s.*; 2½, 2*s.* 3*d.*; 2¾, 2*s.* 6*d.*; 3, 2*s.* 9*d.*

The Hose is Burnettised at an extra charge of 3*d.* per yard.
Union Joints, Branch Pipes, and Jets are also supplied.

CARSON'S ORIGINAL ANTI-CORROSION PAINT, specially patronised by the British and other Governments, the Hon. East India Company, the principal Dock Companies, most public bodies, and by the nobility, gentry, and clergy, for out-door work at their country seats. The Anti-Corrosion is particularly recommended as the most durable out-door Paint ever invented, for the preservation of every description of Iron, Wood, Stone, Brick, Compo, Cement, &c., work, as has been proved by the practical test of upwards of 60 years, and by the numerous (between 500 and 600) testimonials in its favour, and which, from the rank and station in society of those who have given them, have never yet been equalled by anything of the kind hitherto brought before the public notice.

Lists of colours, prices, together with a copy of the testimonials, will be sent on application to WALTER CARSON & SON, 9, Great Winchester Street, Old Broad Street, Royal Exchange, London. No Agents. All orders are particularly requested to be sent direct.

TO AGRICULTURISTS AND OTHERS.

SIMPSON AND BARNES, Openshaw, near Manchester, beg to call the attention of parties requiring power to their PORTABLE and STATIONARY STEAM-ENGINES, from one-horse power and upwards, having the boiler and engine attached. They require no foundation, are simple and cheap, and are sent from the works ready to start when they arrive at their destination.

212° MILNER'S HOLDFAST AND FIRE-RESISTING SAFES (non-conducting and vapourising), with all the improvements, under their Quadruple Patents of 1840-51-54 and 1855, including their Gunpowder Proof Solid Lock and Door (without which no Safe is secure), the STRONGEST, BEST, and CHEAPEST SAFEGUARDS EXTANT.

MILNER'S Phœnix (212°) Safe Works, Liverpool, the most complete and extensive in the world. Show Rooms, 6 and 8, Lord Street, Liverpool. London Depôt, 47A, Moorgate Street, City. Circulars free by post.

LOCKWOOD'S celebrated Nugget (Gilt) Pen, 1 doz. post free for 13 stamps.

TOURISTS, TRAVELLERS, AND OTHERS,
EXPOSED TO THE SCORCHING RAYS OF THE SUN, AND HEATED PARTICLES OF DUST, WILL FIND

ROWLAND'S KALYDOR a most refreshing preparation for the Complexion, dispelling the cloud of languor and relaxation, allaying all heat and irritability, and immediately affording the pleasing sensation attending restored elasticity and healthful state of the skin. Freckles, Tan, Spots, Pimples, Flushes, and Discoloration fly before its application, and give place to delicate clearness, with the glow of beauty and of bloom. In cases of sunburn or stings of insects, its virtues have long been acknowledged. Price 4*s.* 6*d.* and 8*s.* 6*d.* per bottle.

ROWLAND'S MACASSAR OIL, a delightfully fragrant and transparent preparation, and as an invigorator and purifier beyond all precedent.

ROWLAND'S ODONTO, OR PEARL DENTIFRICE, a White Powder, compounded of the rarest and most fragrant exotics. It bestows on the teeth a pearl-like whiteness, frees them from Tartar, and imparts to the Gums a healthy firmness, and to the breath a grateful sweetness and purity.

Sold by A. ROWLAND & SONS, 20, Hatton Garden, London; and by Chemists and Perfumers.

DO YOU WANT LUXURIANT HAIR, WHISKERS, &c.?—The most marvellous production of modern date is ROSALIE COUPELLE'S CRINUTRIAR, which is guaranteed to produce Whiskers, Moustachios, Eyebrows, &c., in a few weeks, and restore the Hair in baldness from whatever cause, strengthen it when weak, prevent its falling off, and effectually checks greyness in all its stages. For the nursery it is recommended by upwards of 100 physicians, for promoting a fine healthy head of hair, and averting baldness in after years. Sold by all Chemists and Perfumers, price 2*s.*, or will be sent post free on receipt of 24 penny stamps, by Miss COUPELLE, 69, Castle Street, Newman Street, Oxford Street, London. Mrs. CARTER writes, "My head, which was bald, is now covered with new hair." Mrs. WILLIAMS—"I can show a fine head of hair from using your Crinutriar." Mrs. REEVE—"My hair is gaining strength and thickness." Sergeant CRAVEN ——"Through using it I have an excellent Moustache." Mr. YATES—"The young man has now a good pair of whiskers. I want two packets for other customers."

TO NERVOUS SUFFERERS.

A RETIRED CLERGYMAN having been restored to health in a few days, after many years of great nervous suffering, is anxious to communicate to others the means of cure; he will therefore send (free), on receiving a stamped envelope, properly addressed, a copy of the prescription used.—Direct Rev. E. DOUGLASS, 18, Holland Street, Brixton, London.

DR. ARNOT'S PILLS WILL CURE YOU!! The extraordinary curative properties of this new discovery in medicine will be proved by a trial. Through their peculiar action upon the system new and pure blood is manufactured, the morbid conditions of the body removed, the constitution strengthened, and health restored. Indigestion, bile, stomach, and bowel complaints, gout, rheumatism, asthma, scrofula, dropsy, ulcers, &c., and all diseases arising from impurities of the blood, and other vital fluids are speedily eradicated by this MIRACULOUS MEDICINE.—Sold in boxes at 1*s.* 1½*d.*, by all chemists. By post 14 stamps. Depôt, 50 Rathbone Place, London.

METCALFE, BINGLEY, AND CO.'S OATMEAL and CAMPHOR SOAP, in tablets (registered Nov. 3, 1854). Price 6*d.* each. This soap will be found the purest and most perfect winter soap ever introduced to the public. It preserves the hands from chapping, and renders the skin soft and agreeable.—Sold wholesale and retail by the inventors and sole manufacturers, METCALFE, BINGLEY, & Co., Brushmakers and Perfumers to H.R.H. Prince Albert, 130B and 131, Oxford Street.

CAUTION.—To prevent fraud, each tablet bears the registered mark and the names and address of the inventors, as above.

METCALFE'S ALKALINE TOOTH POWDER, 2*s.* per box.—The above may be obtained of most respectable Chemists, Perfumers, &c.

TO BE LET ON LEASE, SION NURSERY, Croydon, situated on the road between Norwood and Croydon, and two miles from the Crystal Palace. It contains nearly 7 acres of Land, a good Dwelling-house, several Greenhouses and Pits, with Stable shed, &c. It is well stocked with Shrubs, Trees, and Plants, which can be taken at a valuation.—Further particulars can be had of the present occupier at the Nursery.

TO BE LET, an old-established NURSERY, with a Seed Trade, situate near a large Market Town, and on a main line of railroad, in a very eligible situation for business. The quantity of Land can be made to suit the convenience of the tenant, in proportion to which there is a fair extent of glass.—For further particulars, address A. B., Office of this Paper.

TO BE LET, CHERINGTON WOODSIDE FARM, in the parish of Warkworth, Northumberland; tithe free, and entered to at May-day, 1856, containing about 566 acres, of which 90 acres are in old Grass. The tillage land is of sound good quality, and the old Grass is very valuable fattening pasture. A large portion of the farm has been thorough drained under Government grant. The Farm is within two miles of the Addington Station. Mr. Thos. Brown, of Whitefield House, near Acklington, will show the farm with a plan.—Further particulars may be had by application to GEORGE A. GREY, Esq., Millfield, Northumberland, by whom offers will be received till 12th Nov.

TO BE SOLD, a SEED BUSINESS in London having a very extensive Retail connection throughout the kingdom.—For further particulars apply to C., 10, Stranraer Place, Maida Hill, London.

TO BE SOLD, a few one and two SHEAR GIMMERS, price 2*l.* 2*s.*, by a gentleman who has for several years paid great attention to the breeding of the Black and White Spotted Spanish Sheep; also some RAM LAMBS, 1*l.* 10*s.* each, delivered at the Thirsk Station of the North Eastern Railway.—Address to Mr. W. KIRBY, Kirkby Wiske, Thirsk.

TO BE SOLD, a few WHITE DORKING CHICKENS.—Very choice birds.—Apply to Mr. HORNE, Egham, Surrey.

Sales by Auction.

A TREATISE ON ASTHMA AND DISEASES OF THE HEART.

London: LONGMAN, BROWN, GREEN, & LONGMANS.

NEW AND ENLARGED EDITION OF DR. LINDLEY'S THEORY OF HORTICULTURE.

Just Published, in 8vo, with 98 Woodcuts, price 21*s.* cloth,

THE THEORY AND PRACTICE OF HORTICULTURE; or, an Attempt to explain the chief Operations of Gardening upon Physiological Grounds: being the Second Edition of the "Theory of Horticulture," much enlarged. By JOHN LINDLEY, Ph.D., F.R.S., Corresponding Member of the Institute, Vice-Secretary of the Horticultural Society, Professor of Botany in University College, London, &c.

"The First Edition of this valuable work was issued in 1840, since which time it has had an extensive circulation, and has been translated into the German, Dutch, and even Russian languages. Being more particularly restricted to principles, however, the author at length resolved to render the work more generally interesting and useful by a more frequent reference to practical operations. He has thus greatly extended the matter, by supporting the physiological doctrines with an appeal to facts familiar to cultivators, or which ought to be; and the result is a still more interesting and popular compendium of the principles and practice, or the science and art, of horticulture."—*Builder.*

"This is a Second Edition of the "Theory of Horticulture," with the addition of a large quantity of practical matter, introduced to show how entirely scientific principles and good cultivation correspond. The volume contains about four times as much matter as the first edition . . . . Although very large additions are made to every chapter, while many passages in the first edition have been wholly struck out, it may be proper to say that the greatest changes are those which relate to vitality, climate, domestication, ventilation, propagation, pruning, resting, and soils and manures; such being the subjects in which practical men are most interested. The whole work has, indeed, assumed such a form as to make it evident that the great object of the author has been, not to produce a work suited to men of science, but one which every well informed gardener may understand and apply. As the volume concludes with a very copious index of matter, there is no difficulty in ascertaining where any given subject is treated of."—*Gardeners' Chronicle.*

By the same Author,

INTRODUCTION TO BOTANY. 4th Edition, greatly enlarged; with 6 Plates, and numerous Wood Engravings. Two vols. 8vo, 24*s.*

*** It has been the Author's wish to bring every subject that he has introduced down, as nearly as possible, to the state in which it is found at the present day. In doing so, he has added so very considerable a quantity of new matter, especially in what relates to Vegetable Anatomy and Physiology, that the present Edition may be considered, in those respects, a new work.

London: LONGMAN, BROWN, GREEN, & LONGMANS.

Third Edition, considerably enlarged, price 5*s.* 6*d.*

RURAL CHEMISTRY. By EDWARD SOLLY, F.R.S., F.L.S., F.G.S., Honorary Member of the Royal Agricultural Society of England, Professor of Chemistry to the Horticultural Society of London, Lecturer on Chemistry in the Hon E. I. Co.'s Military Seminary at Addiscombe, &c., &c.

BOOSEY AND SON'S MUSICAL LIBRARY.—The STOCK of MUSIC at this LIBRARY includes above 100,000 Ancient and Modern Operas, Pianofortes and Instrumental Works of every class, and Songs in every language. The Subscribers are able to obtain whatever music they may require without any reserve; and they are permitted to change it as frequently as they may please, whether they are resident in town or country. The accommodation at Messrs. BOOSEY & SON'S Library is superior to that of any other establishment, and the allowance of Music is of the most liberal kind.

Subscribers of Two Guineas per annum are entitled to the use of Two Guineas' worth of Music at one time in town, and Three Guineas' worth in the country. Full particulars may be had on application to 28, Holles Street, London.

"FRIGI DOMO."—Patronised by her Majesty the Queen, the Duke of Northumberland for Syon House, his Grace the Duke of Devonshire for Chiswick Gardens, Professor Lindley for the Horticultural Society, Sir Joseph Paxton for the Crystal Palace, Royal Zoological Society, Mrs. Lawrence, of Ealing Park, and — Collier, Esq., of Dartford.

PROTECTION FROM MORNING FROST.

"FRIGI DOMO," a Canvas made of patent prepared Hair and Wool, a perfect non-conductor of Heat and Cold, keeping, wherever it is applied, a fixed temperature. It is adapted for all horticultural and floricultural purposes, for preserving Fruits and Flowers from the scorching rays of the sun, from wind, from attacks of insects and from morning frosts. To be had in any required length, 2 yards wide, at 1*s.* 6*d.* per yard run, of ELISHA THOMAS ARCHER, whole and sole manufacturer, 7, Trinity Lane, Cannon Street, City, and the Royal Mills, Wandsworth, Surrey; and of all Nurserymen and Seedsmen throughout the kingdom. "It is much cheaper than mats as a covering."

LIGHT, CHEAP, and DURABLE ROOFING.—CROGGON'S PATENT ASPHALTE ROOFING FELT is perfectly impervious to rain, snow, and frost, and has been tested by a long and extensive experience in all climates. Saves half the timber required for slates. Can be laid on with great facility by farm servants or unpractised persons. Price 1*d.* per square foot. CROGGON'S Patent Non-conducting Felt, for covering steam boilers and pipes, saves 25 per cent of fuel. Samples and testimonials sent by post, on application to CROGGON & Co., 2, Dowgate Hill, London, who also supply ship-sheathing felt and inodorous felt, for damp walls, and lining iron houses, and roofs generally, to equalise the temperature.

DR. DE JONGH'S

LIGHT BROWN COD LIVER OIL. Prescribed with complete confidence by the Faculty for its purity, and superior, immediate, and regular efficacy.

It is entirely free from nauseous flavour, and being invariably and carefully submitted to chemical analysis—AND ONLY SUPPLIED IN SEALED BOTTLES TO PRECLUDE SUBSEQUENT ADMIXTURE OR ADULTERATION—this Oil possesses a guarantee of genuineness and purity offered by no other Oil in the market.

TESTIMONIAL from **ARTHUR H. HASSALL,** M.D., F.L.S., M.R.C.P., Chief Analyst of the Sanitary Commission of the *Lancet*, Author of "Food and its Adulterations," &c. &c. &c.

"I have more than once, at different times, subjected your Light Brown Oil to chemical analysis—AND THIS UNKNOWN TO YOURSELF—and I have always found it to be free from all impurity and rich in the constituents of bile. So great is my confidence in the article, that I usually prescribe it in preference to any other, in order to make sure of obtaining the remedy in its purest and best condition."

Sold only in bottles, capsuled and labelled with Dr. DE JONGH'S Signature, WITHOUT WHICH NONE ARE GENUINE, by ANSAR, HARFORD, & CO., 77, STRAND, London, Dr. DE JONGH'S sole Consignees; and by most respectable Chemists in town and country.

Half-pints (10 oz.), 2*s.* 6*d.*; Pints (20 oz.), 4*s.* 9*d.*; Quarts (40 oz.), 9*s.*; IMPERIAL MEASURE.

THE CHELTENHAM FLOOD.—A Subscription has been opened for the relief of the sufferers in the destructive flood which visited Cheltenham a few weeks since. This sad calamity has caused great loss and damage to Mr. C. H. Jessop, Mr. Hodges, Messrs. Jessop Brothers, and others. Greenhouses, Gardens, and Aviaries have all suffered more or less from the rush of waters in which they were, for five or six hours, completely submerged, and by which the most beautiful and valuable of their shrubs and plants were altogether destroyed. A great part of Mr. Jessop's Nursery was covered with 6 or 8 feet of water, and the damage done to the plants has been immense. In addition to about 270*l*. which has been subscribed in Cheltenham, the following gentlemen have handsomely come forward to the help of the sufferers:—

Messrs. Noble, Cooper, & Bolton, London	£10	10*s*.	0*d*.
" Hurst & M'Mullen, London	5	0	0
" Waterer & Godfrey, Woking	5	0	0
" John Sutton & Sons, Reading	3	3	0
Proprietors of *Gardeners' Chronicle*	2	2	0
" Peter Lawson & Son, Edinburgh	2	2	0
" J. C. Wheeler & Son, Gloucester	2	2	0
" John Palmer, Annan	2	2	0
" John Waterer, Bagshot	2	2	0
" Thomas Gibbs & Co., London	1	1	0
" E. G. Henderson & Son, London	1	1	0
" Jacob Wrench & Sons, London Bridge	1	1	0
" W. Tavey, King's Road, Chelsea	1	1	0
" Moore & Son, Birmingham	1	0	0
" Ward & Son, Bath	0	10	0

A further list will appear next week; in the meantime subscriptions will be thankfully received by Messrs. Jacob Wrench & Sons, London Bridge; Noble, Cooper, & Bolton, Fleet Street; Wheeler & Son, Gloucester; or A. Paul, Esq., Cheltenham.

SCOTTISH GARDENERS AND LAND STEWARDS ASSOCIATION.—ELECTION OF PENSIONERS.—The Fifth Annual General Meeting for the Election of Pensioners will be held on the 14th November ensuing. Persons eligible for admission are "aged and infirm or disabled Gardeners, Nurserymen, Seedsmen, Land Stewards, Bailiffs, and Foresters," and the Widows of such Persons. Printed forms of application for intending Candidates may be had of the Secretary, 6, York Place, Edinburgh, and all claims must be sent in on or before the 15th October.

TO NURSERYMEN AND OTHERS.

IPSWICH CEMETERY.—The BURIAL BOARD for the BOROUGH OF IPSWICH are prepared to receive TENDERS for PLANTING to be done in their Cemetery during the present autumn. Forms of Specification with Schedules, and quantities may be obtained on payment of 5*s*. for each copy, on and after the 26th day September, at the Offices of the Board, in the Woodbridge Road, Ipswich, and at the office of Mr. Davidson, Landscape Gardener, 36, Great Russell Street, Bedford Square, London.—Ipswich, September 22.

WILLIAM BARRATT, Landscape Gardener, Wakefield.

*** Plans and Estimates furnished.

BROWICK RED WHEAT.—SEED WHEAT of the above description, and true, may be obtained immediately by addressing Mr. Edward Ball, Bailiff, Post Office, Beaconsfield. Price, by quarter or sack, 10*s*. per bushel. All orders to be accompanied by a Post Office order or remittance.

WANTED, a quantity of BLACK JAMAICA and QUEEN PINES, either suckers or rooted plants that will fruit next year. They must be clean. This would be a good opportunity for any one giving up business to dispose of the whole stock. Also a quantity of the Coniferæ, particularly of the Deodar and of Araucarias: also Seeds of the Coniferæ. Terms, cash.—Address, with prices, F. M., Office of this Paper.

HYACINTHS AND OTHER IMPORTED BULBS.

DAWE, COTTRELL, AND BENHAM (Successors to Frederick Warner), Wholesale Seedsmen, have just received their annual importation of DUTCH and other BULBS in very fine condition. Catalogues on application.

3, Laurence Pountney Lane, and 36, Moorgate Street, London. Established 1720 at 28, Cornhill.

GUERNSEY AND BELLADONNA LILIES may now be had of Dawe, Cottrell, & Benham, 3, Laurence Pountney Lane, and 36, Moorgate Street, London.

DUTCH FLOWERING BULBS.

JAMES CARTER AND CO.'s comprehensive CATALOGUE of DUTCH and CAPE BULBS and SEEDS for Autumn sowing, is now published, and will be forwarded free of charge and post paid upon application to James Carter & Co., 238, High Holborn, London.

R. PARKER begs to inform his friends and patrons that his PRICED CATALOGUE of DUTCH BULBS is now ready, and will be forwarded post free upon application. Paradise Nursery, Hornsey Road, Holloway.

IMPORTED DUTCH BULBS.

JAMES GRAHAM begs to announce that his priced Catalogue of DUTCH BULBS is now ready, and can be had free on application.—Seed and Horticultural Establishment, Northgate, Chichester (late Silverlock and Son.)—Sept. 22.

WILLIAM CUTBUSH AND SON beg to acquaint their patrons and friends that their ANNUAL CATALOGUE of DUTCH BULBS can be had, postage free, on application. The superior quality of their roots is well known, but as a further guarantee they obtained the Awards at the Horticultural Society's Rooms, Regent Street, last spring.

Highgate Nurseries, near London.

DUTCH HYACINTHS AND OTHER BULBS.

J. AND J. FRASER beg to announce that they have received their annual importation of HYACINTHS and other FLOWER ROOTS, of which a descriptive Catalogue may be had by enclosing one postage stamp. This Catalogue contains some instructions for the successful cultivation of the various roots.—Lea Bridge Road, Sept. 22.

LARGE AND VERY CHOICE ASSORTMENT OF IMPORTED DUTCH BULBS.

CLARKE AND COMPANY, Wholesale Seedsmen, 86, Borough, London, beg to inform country dealers they have received from the best growers in Holland their annual supply of the above, which are very fine and well matured Bulbs this season. Catalogues forwarded on application. The usual credit given upon a satisfactory reference.

DUTCH BULBOUS ROOTS.

MARTIN AND SON have much pleasure in informing their friends that they have received in good condition their annual importation of the above, which are particularly fine, and trust to be favoured with early orders.—Catalogues may be had and also of their Nursery Stock for two stamps.—Nursery and Seed Establishment, Cottingham (1788): Hull Branch, Junction Street.

DUTCH AND OTHER BULBS.

JOHN CATTELL begs to inform his patrons and the public that his DUTCH BULBS have arrived in unusually fine condition. Among the bulbs of J. C.'s own growing he has a very large stock of the beautiful sky-blue Squill (Scilla siberica) which is without exception the most distinct and showy, as well as the hardiest of all our early spring flowers. Also a large stock of Japan and other Lilies, Tritonia aurea, Hybrid, and other Amaryllis, Tropæolum tricolorum grandiflorum, very strong; fine assortments of Gloxinia, Cyclamen, Gladiolus, Alstræmeria, &c. A priced catalogue of which may be had on prepaid application.—Nurseries, Westerham, Kent.

IMPORTED DUTCH FLOWER ROOTS.

T. F. WINSTANLEY begs to announce that his Priced Catalogue of Dutch Bulbs for the present season will shortly be ready, and can be had free on application. It contains a list of all the newest and leading sorts in cultivation, including Hyacinths, Narcissus, Jonquils, Amaryllis, Early Single and Double Tulips, Crocus, &c., all of which have been grown by one of the first growers in Holland, and can be relied upon as being good sound Bulbs, and true to name.

28, Market Place, Manchester.

DUTCH FLOWER ROOTS, ETC. ETC.

PETER LAWSON AND SON, Seedsmen and Nurserymen to Her Majesty the Queen, and to the Highland and Agricultural Society of Scotland, beg to intimate the arrival of their first assortment of DUTCH FLOWER ROOTS, Catalogues of which may be had, free, on application, and orders for which are respectfully solicited,

They have also on hand very select stocks of foreign Italian Rye-grass, Crimson Clover (Trifolium incarnatum), Alsike Clover (Trifolium hybridum), Dwarf Essex Rape, Winter Tares, Stubble Turnip, &c. &c.

London: 27, Great George Street, Westminster.—Sept. 22.

CHOICE HYACINTHS, NARCISSUS, TULIPS, CROCUS, ETC. ETC.

JAMES CHARTRES AND CO., Importers of Dutch Flower Roots, Seedsmen, &c., beg to announce that their unrivalled Stock of the above have arrived in splendid condition: the Roots are remarkably large and handsome.

J. C. & Co. earnestly solicit early orders to insure the finest Roots. A Catalogue may be had on application.

74, King William Street, City, and York Nursery, Hanger Lane, Stamford Hill, London.—Sept. 22.

GEORGE JACKMAN begs to state his PRICED CATALOGUE of choice CONIFERA, HARDY EVERGREENS and ORNAMENTAL TREES, which are well grown, and constantly removed: also Roses, Standard, Dwarf, and dwarf-trained Fruit Trees, and Forest Trees, can be had on application by enclosing one Postage Stamp.

G. J. respectfully invites persons planting to pay a visit to his extensive nursery, one and a half mile from Woking Station, South Western Railway, where all trains stop, and conveyances can be had.—Woking Nursery, Woking, Surrey.

HORTICULTURAL BUILDING AND HEATING BY HOT WATER.

AT THE LOWEST PRICES CONSISTENT WITH GOOD MATERIALS & WORKMANSHIP.

GRAY & ORMSON, DANVERS STREET, CHELSEA, LONDON.

GRAY AND ORMSON, Danvers Street, Chelsea, having had considerable experience in the construction of Horticultural Erections, which, for elegance of design, good materials, and workmanship, combined with economy and practical adaptation, cannot be surpassed by anything of the kind in the country, are in a position to execute orders on the lowest possible terms.

G. & O. have been extensively employed by the Nobility, Gentry, and London Nurserymen; and they can with the greatest confidence give the most satisfactory references to all by whom they have been favoured with orders. Their Hot-water Apparatus is also constructed on the most approved and scientific principles, for all purposes to which the application of Heating by Hot Water can be made available.

C. STEPHENSON, late STEPHENSON AND SONS, 61, Gracechurch Street, London, Manufacturer of Iron Hurdles, Fencing, &c., Improved Iron and Copper Conical Boilers and Apparatus for Warming Buildings of every description, by Hot Water.—Prices and Estimates furnished upon application.

HORTICULTURE IN ALL ITS BRANCHES.

JOHN WEEKS & Co., King's Road, Chelsea,

HOTHOUSE BUILDERS.

THE NOBILITY AND GENTRY about to erect Horticultural Buildings, or fix Hot-water Apparatus, will find at our Horticultural Establishment and Hothouse Works, King's Road, Chelsea, an extensive variety of Hothouses, Greenhouses, Conservatories, Pits, &c., erected, and in full operation, combining all modern improvements, so that a lady or gentleman can select the description of House best adapted for every required purpose.

The HOT-WATER APPARATUS, which passes through all the Houses and Pits affording both top and bottom heat, is in constant operation and particularly worthy of attention.

Many of the Houses and Pits are of wide and lofty dimensions, and together equal in length 1000 feet. They are all effectually heated by one boiler, which, during the severe winter months does not cost in labour and fuel more than 3s. 8d. per day, and the apparatus is so arranged that each House or Pit may be heated separately and to the required temperature. The splendid collections of Stove and Greenhouse Plants are also in the highest state of cultivation, and for sale at very low prices. Also a fine collection of strong Grape Vines in pots, from eyes, all the best sorts.

Plans, Models, and Estimates of Horticultural Buildings; also Catalogues of Plants, Vines, Seeds, &c., forwarded on application to John Weeks & Co., King's Road, Chelsea, London.

HEATING BY HOT WATER.

JOHN WEEKS & Co., King's Road, Chelsea, Horticultural Builders and Hot Water Apparatus Manufacturers. At our two Establishments horticultural science is fully carried out in all its branches.

The accompanying sketch represents our Improved Boiler. These Boilers are very powerful, durable, and economical. The whole of our extensive nursery establishment is heated by one boiler, measuring only 5 ft. by 3 ft. 6 in. The Houses heated consist of forcing-houses of various descriptions, many of them are of wide and lofty dimensions, in length 1000 ft., and exposing to the atmosphere upwards of 16,000 superficial feet of glass. During the late severe winter it only cost us 3s. per day for fuel, and we had no [illegible] than a sufficient command of heat. A number of forcing-houses can be heated by one boiler, and any part regulated at pleasure. Plans, Models, and Estimates of Horticultural Buildings, or Heating by Hot Water, forwarded on application.

John Weeks & Co., King's Road, Chelsea, London.

VIOLETS.

R. SHACKELL begs to offer strong Plants of his superior Violet Russian Superb, at 4*s.* per dozen; strong plants of the Neapolitan Violet, now fit for potting, at 4*s.* per dozen; Double Perpetual Tree Violet, at 4*s.* per dozen; single sweet winter blooming White Violet, at 4*s.* per dozen; Double White do., 4*s.* per dozen; old Russian Violet, 10*s.* per 100 plants. Hamper and package included for all orders above 10*s.*

R. S. would be happy to enter into arrangements with any retail Florist for supplying Bouquets of Violet blooms after the 1st of October until the 1st of March, provided the weather permit, at 5*s.* per 100. Bouquets almost to any extent.

ROBERT SHACKELL, Locksbrook Nursery, Bath.

NEW GERANIUMS.

JOHN SCOTT, FLORIST, Bathford, Bath, can supply nice healthy plants, package and hamper included, for 42*s.* per dozen:—Grand Sultan, Hubert, Jessica, Lord Raglan, Omar Pasha, Pandora, Petruchio, Phaeton, Queen Eleanor, Seraskier, Serena, Topsy, Fair Ellen, Una, Vesper, Wonderful, Yerda, King of Portugal; the above 18 for 56*s.* The following at 18*s.* per dozen:—Carlos, Eugenie, Governor-General, Ladybird, Leah, Lucy, Majestic, Mary, Optimum, Pictum, Pilot, Purple Perfection, Queen of May, Regalia, Rival Queen, Sanspareil, Virginia. The following 10 French spotted varieties, with Sanspariel and Eugenie, 16*s.*:—Auguste, Miellez, Colonel Foissey, Etoile de Jardins, Jaques Duval, James Odier, Gustave Odier, Gloire de Bellevue, General Cavaignac, Madame Lamoricière, Triomphe de la Tour. The above three sets for 4*l.* 10*s.* They are all nice strong well-rooted plants, which could not fail to please.

Post Office Orders, payable at Bath, requested from unknown correspondents.

THE IMPROVED BROWICK RED AND OTHER SEED WHEAT.

WILLIAM BARNES, in returning thanks to his customers for SEED CORN, begs to offer this season the following sorts, which have been procured from the finest and best varieties, regardless of expense in the purchase and cost in the cultivation—viz., Improved Browick Red, Spalding's Red, Old Red or Lammas Wheat, White Chaff Red, and Bristol mixed with White, all of which he will warrant *true and clean.*

Mr. B. can recommend the Improved Browick Red with much confidence as being one of the greatest acquisitions in Red Wheat, for light or black land, yet offered to the farmer. In this locality (Deeping Fen) it was less injured by frosts and mildew than other Reds, and was pronounced by all who inspected it whilst standing over several acres to be unrivalled by any in the district.—For further particulars, address WILLIAM BARNES, the Elms Farm, near Spalding, Lincolnshire.

THE PAMPAS GRASS,
"GYNERIUM ARGENTEUM."

LUCOMBE, PINCE, AND Co. having now for sale the finest stock of flowering plants in this country of the above, are enabled to offer their well established plants to bloom this autumn at the following prices:—

Fine specimens with two flower stems ...	21*s.* 0*d.* each.
Ditto with one ditto	10*s.* 6*d.* „
Smaller plants to bloom next year	7*s.* 6*d.* „

L., P., & Co. have also healthy seedlings at 30*s.* per dozen, which will be ready in October, which, however, they deem it right to say will most probably not bloom for two years. To such parties as wish at once to see the plant in its beauty, L., P., & Co. would strongly recommend the larger sizes, as they are much better and cheaper.

Few plants are more ornamental than this Gigantic Grass, the leaves (which are more than 7 feet in length, curving gracefully outwards) grow in large tussocks, thereby producing a very fine effect, and from the midst of these numerous flower stems arise to the height of from 6 to 8 feet, surmounted by elegant panicles of inflorescence nearly 3 feet long, resembling beautiful waving plumes of silvery feathers. It is perfectly hardy, and is also easy of cultivation. A grand specimen of this noble plant is now in the Exeter Nursery, pushing up nearly twenty large flower stems and numerous small ones, and will continue to be an object of great attraction for a considerable time.

EXETER NURSERY, EXETER.
ESTABLISHED 1720.

CUCUMBER SEEDS FOR WINTER SOWING.—The three best and most certain varieties ever sent out, and such as are sure to give satisfaction for winter growing. General Canrobert, fine black spine, length 15 inches, 2*s.* 6*d.* per packet. Lord Kenyon's Favourite, length 12 inches, very handsome, free setter, and most prolific bearer, 2*s.* 6*d.* per packet. Gordon's White Spine, length 20 inches: this has proved to be the best long winter variety now in cultivation, 1*s.* 6*d.* per packet.

DIGITALIS, OR FOX-GLOVE SEED.

This beautiful hardy biennial has been so much improved within the last two or three years by continual hybridising, that the brilliancy of the colours, the numerous varieties into which it has sported, and the dwarfness of the plants, will cause it when once known to be planted in the largest and smallest of flower gardens, round the borders of shrubberies, and for making beds in large pleasure grounds where brilliancy and effect is required. They will grow well on rock-work or sloping banks, where numerous other varieties of plants will not thrive at all. The seed should be sown now in pans or boxes, and planted out early next spring; by so doing they will bloom well next season.

Sold in packets at 1*s.* 6*d.*, or double packets at 2*s.* 6*d.* Every order must be accompanied by Penny Postage Stamps, or Post Office Order payable to

EDWARD TILEY, NURSERYMAN, SEEDSMAN, & FLORIST,
14, Abbey Churchyard, Bath, Somerset.

JOHN WESTWOOD will be prepared on and after the 10th of October next to send out good well-rooted plants of the following novelties, at the very low prices undernamed, viz.—

VERBENA "MRS. HALFORD."—The finest white yet raised; no other will be grown wherever it is introduced. Having had plants in his possession before any other florist, J. W. has now on hand many thousands, and is therefore enabled to offer them at 9*s.* per dozen, or 3*l.* per 100.

PETUNIA "MARQUISE DE LA FERTE."—A decided improvement on Shrubland Rose, and must entirely supersede it. The highest praise has been awarded this flower in the *Gardeners' Chronicle*, "The Cottage Gardener," and by all who have seen it. 8*s.* per dozen, or 2*l.* 15*s.* per 100.

All the White Corolla'd and other FUCHSIAS of 1855, let out by Chauviere, Epps, Henderson & Co., and Smith, at 10*s.* per dozen.

The last new VERBENAS sent out by Chauviere, Smith, Turner, &c., many of which (especially those raised in France) are superior to the older varieties. 8*s.* per doz., or 2*l.* 15*s.* per 100.

Seedling Herbaceous CALCEOLARIAS from plants of first-rate quality (superior to any exhibited during the past season), carefully impregnated by the Rev. E. Trimmer, who has hitherto been remarkably successful with this flower. Best selection, 8*s.* per dozen, or 2*l.* 15*s.* per 100; 2d selection, 5*s.* per dozen, or 1*l.* 15*s.* per 100.

Seedling CINERARIAS from all the best named varieties, 4*s.* per dozen, or 1*l.* 10*s.* per 100.

Fimbriated PRIMULA SINENSIS, raised from plants inferior to none in the trade, of last year. 5*s.* per doz., or 1*l.* 15*s.* per 100.

J. W. has also for immediate sale Vines from Eyes of the best and leading sorts, at 24*s.* per dozen.

The carriage will be paid to London; and where an order exceeds 2*l.* additional plants will be given in, and the hamper and package not charged for.

The Floral Nursery, Acton Road, Turnham Green.

DUTCH ROOTS.

BASS AND BROWN beg to announce the arrival of their first Importation of DUTCH ROOTS for the present season. Their stock of Bulbs of imported and home growth is very select, among which will be found those of the finest sorts in cultivation, including their extensive assortment of Gladioli and other Cape Bulbs.

Imported DUTCH HYACINTHS, with printed instructions for their culture:—

50 varieties in 50 choice sorts	30*s.*
25 varieties in 25 do. do.	16*s.*
Best named varieties, per dozen ... ... 6*s.*, 9*s.*, and	15*s.*
Separate colours without name, per dozen	3*s.*

If required for forcing, we particularly recommend early planting.

The BULB LIST is now ready and may be had on application and the whole of the Autumn Catalogue will shortly be completed

Seed and Horticultural Establishment, Sudbury, Suffolk.—September 22.

NEW STRAWBERRIES AT REDUCED PRICES.
GROWN AND OFFERED FOR SALE BY

WILLIAM J. NICHOLSON, Egglescliffe, near Yarm, Yorkshire.—The following splendid varieties have been well proved this season and given complete satisfaction, viz., Sir Harry (Underhill's), 100 plants, 4*l.*; 40, 1*l.* 18*s.*; and 20, 1*l.*; or 12*s.* 6*d.* per dozen. Omar Pacha (Ward's), 1*l.* per 100; 12*s.* per 50; 7*s.* per 25. Scarlet Nonpareil (Patterson's), 2*l.* per 100; 1*l.* per 50; 12*s.* per 25. Sir Charles Napier (Smith's), 1*l.* per 100; 12*s.* per 50; 7*s.* per 25. Admiral Dundas (Myatt's), 1*l.* per 100; 12*s.* per 50*s.*; 7*s.* per 25. Nicholson's Ajax, Ruby, Captain Cook and Fill-Basket, 6*s.* per 100; Ingram's Prince of Wales, Nimrod, Eliza (Rivers's), Surprise (Myatt's), and Bicton Pine, a large white one, 6*s.* per 100; British Queen, Black Prince, Eleanor (Myatt's), Old Pine, Trollope's Victoria. Goliah (Kitley's), Keens' Seedling, Old Roseberry, all at 4*s.* per 100; Crystal Palace, a very large and late variety, 10*s.* per 100. Post-office Orders payable at Yarm are expected with all orders. The plants will be securely packed and forwarded to any part of the kingdom.

FISHER, HOLMES, AND CO. beg to offer the following, all of which are good healthy Plants.

Abelia uniflora, each 9*d.* to 1*s.* 0*d.*		Escallonia pterocladon	5*s.* 0*d.*
Azalea amœna	1 0	Eugenia Ugni ... 1*s.* 6*d.* to	2 6
„ Stanleyana... ...	1 6	Fuschia, Florence Nightingale	1 6
„ Symmetry	1 6	„ Lady of the Lake	1 0
The following are from 1*s.* to 1*s.* 6*d.* each:—		„ Climax ... 1*s.* to	1 6
Azalea Frosti		„ Empress Eugenie	1 0
„ aurantia superb		„ violæflora pleno ...	1 0
„ lateritia pulchra		„ Dominiana... ...	1 6
„ Apollo		Henfreya scandens ...	1 0
„ white		Hexacentris mysorensis	1 0
„ „ double		Hoya bella	1 0
„ fulgens		Hydrangea japonica variegata ... ... 1*s.* to	2 6

„ optima		„ javanica	1 6
„ extrani		„ salicifolia	2 6
„ decora		Impatiens Jerdoniæ, 1*s.* 6*d.* to	2 6
„ amabilis		Lycopodium umbrosum	0 9
„ Hebe.		„ inæqualifolia ...	1 0
Æschynanthus speciosus, fine plants ...	1 6	„ Poeppigiana ...	1 0
„ splendidus, do. ...	1 6	„ viticulosa	0 9
Acacia verticillata ...	1 0	„ apothecum	1 0
Agapanthus umbellatus, fol. var....	1 6	„ formosum	1 0
Begonia Prestoniensis, fine plants	1 0	„ cœsium arboreum...	1 0
Boronia Drummondi ...	2 6	Mandevillea suaveolens	1 6
Burchellia capensis 1*s.* to	1 6	Maranta alba lineata ...	2 6
Caladium bicolor superba... ... 1*s.* 6*d.* to	2 6	Mitruria coccinea ...	0 9
Clerodendron splendens	1 6	Mussænda frondosa ...	1 6
Cyrtoceras reflexum ...	2 6	Pentas rosea	1 0
Dipladenia crassinoda ...	1 6	Pimelea Hendersoni ...	2 6
Desmodium gyrans ...	1 6	„ spectabilis	2 6
Eranthemum leuconervum	1 0	Swansonia Lessertifolia	2 6
Erythrina crista-galli, 1*s.* to	1 6	Statice Halfordi, fine plants ... 1*s.* 6*d.* to	2 6
		„ sinuata	0 9
		Veronica variegata ...	1 0

Remittances respectfully requested from unknown correspondents.—Handsworth Nursery, Sheffield, Sept. 22.

WILLIAM YOUNG begs to call the attention of Noblemen, Gentlemen, Public Companies, and Planters in general to his extensive stock of CHOICE CONIFERÆ, HARDY EVERGREENS, ORNAMENTAL TREES, AMERICAN PLANTS, &c., which are this season particularly fine, and having been well prepared for removal, he can confidently recommend them to transplant with perfect safety.

W. Y. invites persons about to plant to inspect his stock, which is standing over 50 acres of ground, in which will be found all kinds of plants adapted to every description of ornamental planting. It consists of HARDY CONIFERÆ, containing some of the finest specimen plants ever offered.

AMERICAN PLANTS.

Azaleas, fine named sorts
Rhododendron ponticum (good for cover).
Do. all the new and best vars.
Kalmias, Andromeda, Ledums. &c. &c.

STANDARD ROSES, of all the best varieties.
FRUIT TREES, ORNAMENTAL DECIDUOUS TREES, for Parks or Avenues, from 10 to 12 feet.
FOREST TREES, for Copse Planting, from 2 to 4 feet.
Prices given on application.

A Catalogue is now ready, and may be had for two postage stamps.

The Nurseries are two miles from Godalming Station, South-Western Railway, where conveyances can always be obtained.

Milford Nurseries, near Godalming, Surrey.

AZALEAS AND ERICAS.

W. J. EPPS has much pleasure in offering the following fine, bushy, well-grown plants, and of the choicest and best varieties, in large 48 and 32-size pots.

AZALEAS 18*s.* per dozen; 5*l.* per 100.
ERICAS 12*s.* and 18*s.* per dozen; 4*l.* and 5*l.* per 100.

These will make very pretty specimens for the ensuing season; all orders to be accompanied with a remittance from unknown correspondents.—Maidstone, Sept. 22.

ROSES.

S. PONSFORD, NURSERYMAN, SEEDSMAN, AND FLORIST, begs to say that his fine collection of ROSES is now in the beauty of the Autumn blooming, open to visitors every day (Sunday excepted). The Stock comprises everything good and useful. To Gentlemen anticipating planting in the coming season, S. P. can offer his general Nursery Stock with perfect confidence, not only containing everything in general demand, but unusually good in condition, and as low in price as any honest tradesman can render. New ground work executed to any extent.

Loughborough Park Nursery, Cold Harbour Lane, Brixton.

N.B.—A Descriptive Catalogue forwarded on the receipt of two postage stamps.

E. R. GREENUS, from his PROXIMITY to the Watford Station (London and North-Western Railway), begs to say that he can execute all orders with the UTMOST DESPATCH. His Stock (being FINE this season) of FRUIT TREES, Trained and Untrained; STANDARD and DWARF ROSES of the best sorts; well grown FLOWERING SHRUBS, EVERGREENS, FOREST TREES, AMERICAN PLANTS, and NURSERY STOCK in general, all which, from FREQUENT TRANSPLANTING, can be removed with perfect safety and success. Carriage paid to London on all orders above 2*l.* Garden and Agricultural Seeds supplied.—Railway Nurseries, Watford and Rickmansworth.

VEREA CRENATA (*Syn.* KALANCHOE VARIANS), —THE LEAF OF LIFE—*Nat. Ord.* CRASSULACEÆ.—A small importation has lately been made of the leaves of this interesting botanical curiosity, which matures plants in the serrations of its leaves.—Leaves on sale at 2*s.* 6*d.* each, post free, at GEORGE ROBERTS, 32, Moorgate Street, London, where a drawing of the plant in flower may be seen. Further described in reply to letters.

NEW PELARGONIUMS.

GEORGE SMITH has a fine Stock of the following first class PELARGONIUMS in strong Plants, at from 30*s.* to 40*s.* per dozen, according to the sizes of Plants, hamper included with Plants to compensate for carriage:—(Forster's), Jessica, Phaeton, Seraskier; (Hoyle's), Hubert, Lord Raglan, Omar Pasha, Serena, Topsy, Wonderful, Yerda, Zoe; (Beck's), Conqueror, Dido, Fidelia, Laura, Lydia, Silenus; (Turner's), Grand Sultan, Pandora; (Forquett's) Petruchio; (Story's), Fair Ellen, Snowflake; (Horken) Una; (Cant's) Vespa; (Dobson's) Commander-in-Chief; (Fuller's) Gem of the West. With a choice assortment of show and fancy kinds. A descriptive Catalogue on application. Unknown correspondents forwarding a remittance with their orders will be liberally dealt with. Post-office orders payable at Islington.

Tollington Nursery, Hornsey Road, Islington, London.

RHODODENDRONS.

JOHN WATERER begs to announce that he is now prepared to execute orders for his two New Hardy Hybrid Rhododendrons, in good established plants, at 42*s.* each.

Rhododendron JOHN WATERER, colour glowing carmine, large truss, fine foliage, and a most abundant bloomer, in perfection about the 15th June.

Ditto, MRS. JOHN WATERER, a bright rosy crimson, fine conical truss, a very free blooming kind, in flower about 15th of June.

To the admirers of this justly noble class of Plants, JOHN WATERER has the pleasure of recommending the above as being the greatest acquisitions yet offered. They combine in a marked degree the necessary requisites for really first-rate hardy crimson varieties, viz., imposing colours, abundant bloomers, extreme hardiness, and flower at a time when they are not liable to be injured by spring frosts.

The American Nursery, Bagshot, Surrey, Sept. 22.

The Gardeners' Chronicle.

SATURDAY, SEPTEMBER 22, 1855.

THE expression "trifacial Orange" used by us lately (p. 596) has puzzled some of our readers. The explanation of the term will be found at length in the Theory and Practice of Horticulture, p. 359. It was applied to a tree found in a garden at Alexandria, having an Orange, a Citron, and a Lemon, all combined into one fruit beneath one common rind. Of this as a fact there is no doubt: as some at least of those who have been in Egypt and known Boghos Joussouff are probably aware.

The history of this singular production has been inquired into. Mr. ST. JOHN, who first brought it under the notice of the public, assures us, of course upon the authority of the native Egyptians, that it may be obtained by grafting the embryos of a Lemon, a Citron, and an Orange in the following manner. One of the three seeds is wholly skinned, so as to lay the embryo quite bare. Each of the other two is half skinned, that is to say the skin is removed from one side only. This being done the naked embryo is placed between the two others so as to be in contact with their skinned sides, and the whole are bound together with fine Grass. They are then committed to the ground in the usual way, the embryos grow together into one plant, and ultimately the trifacial fruit in question is borne. We are further assured that this practice is of great antiquity.

The first question which naturally arises is whether the story told to Mr. ST. JOHN is true. Since no evidence exists in Europe upon that point, the next is whether such an operation as is described is possible. We are not aware that gardeners have ever attempted to graft seeds on each other; so that the experiment remains to be tried, and its possibility or impossibility must for the present remain conjectural. There is however a class of facts which render it probable that seeds, that is to say

embryos, may be thus treated artificially, for nature sometimes performs the operation by accident.

In his examination of the common Miselto M. Decaisne found not only that the seeds often contain two embryos, which was known before, but that the latter occasionally grew to each other, forming a true vegetable twin. (See his *Mémoire sur le développement du Gui* in the Transactions of the Royal Academy of Brussels, volume xiii.; or a copy of one of his figures in the Vegetable Kingdom, p. 790, fig. 524.) Here we have one case of embryos naturally grafted by contact.

Prof. Röper mentions a similar case in the *Euphorbia platyphylla*, where two embryos appeared to be conjoined; we must, however, add that he could not wholly satisfy himself whether the wound observed where they separated might not have been accidentally caused by the knife used in dissecting the seed (see this author's *Enumeratio Euphorbiarum*, p. 17, t. 1, fig. 67—71.)

A similar condition of the common garden Cress is said to have been observed; but we do not recollect where the fact is recorded.

The most remarkable case is, however, that of the Salisburia mentioned by Endlicher, apparently on the authority of Siebold. "In the seed of this plant," he says, "are frequently found two, or three, or even more embryos, which, when they germinate form young plants so closely pressed against each other that in the first season they often grow together into one common trunk. And this is imitated by the Japanese and Chinese gardeners, who when they propagate the Salisburia by suckers graft several stems together in order to give vigour to the specimen, which sometimes grows with an immense trunk, and a noble wide-spreading head." (*Synops. Conif.*, p. 237.) The first part of this statement is adverted to by Dr. Hooker and Mr. Binney in their admirable article on the fossils called Trigonocarpon and Sigillaria, lately published in the Philosophical Transactions.

Such instances seem to show that it is far from impossible to graft one embryo on another. Nor is there anything in the nature of plants opposed to such a conclusion. On the contrary, one of the great peculiarities of the vegetable world is the tendency which young parts always have to unite, if in contact. The whole art of budding and grafting turns upon the facility with which this natural process can be imitated; all that is necessary being to bring together the young *cellular matter*, which is exclusively the part of the structure by which adhesions are effected. Now, the embryo of a plant consists of nothing except cellular matter.

The difficulty of performing the operation will hardly deter such dexterous manipulators as we have in abundance among amateurs as well as professional propagators, and it seems well worth a fair trial. Now is the time to do it, when seeds are ripening and not yet hardened. Good races to submit to the operation are not only the whole Citron tribe, but the Peach and Nectarine, the various breeds of Plums, Oaks, Chesnuts, and Filberts. All that we would suggest is, that the seeds be taken a little before they are quite ripe, that they be planted in a gentle bottom heat the moment they are grafted, and that in the case of plants like Oaks, which abound in gallic acid, a silver knife should be used instead of a steel one.

By way of encouraging young gardeners to set about this experiment, we offer to the first who shall produce satisfactory evidence of his success a free copy of the *Gardeners' Chronicle* for seven years.

What plants should be admitted into the different departments of the Botanical Garden is a question of great practical importance, which is but too often lost sight of. It being generally supposed that the more complete the collection is the better it will be, the endeavour is to cultivate anything that can be had. But completeness never can be obtained. A limit is always set to the botanical collection either by want of space or of pecuniary means, or of scientific time or capacity for keeping it in order, and it is a good selection, not a complete collection, that must be aimed at. The more restricted the space and the means the more pains it requires to make such a selection as shall best answer the purpose of instruction. No more species should be planted in the herbaceous borders than can be correctly named and maintained in health and vigour of a sufficient size or in sufficient numbers for the purposes required. To render these as instructive as circumstances will permit, they must be selected in each family from as many different types as possible; and in every genus where several species can be admitted, these should be made to represent as many as possible of the distinct forms assumed by the genus. If, out of several species equally instructive, room can only be found for a portion, a preference should always be given to those which afford some practical interest, such as medicinal or œconomico-technical plants; and where the pecuniary means are very limited it becomes important that the plants admitted should be of easy cultivation. Even in the richest gardens a selection is better than a collection. A few well defined species, accurately named, good representatives of the really different forms included under one generic type, authentic specimens of useful plants, are infinitely more conducive to facilitate the study of botany than the masses of ill-defined garden varieties, running one into another under false or doubtful names, which disfigure nine-tenths of the botanical gardens I have visited.

Let us take for example the first genera of Ranunculaceæ, and suppose our limits very confined, our climate that of central Europe or rather colder, we might plant in the herbaceous border Clematis Vitalba, Flammula, Viorna, Viticella, alpina, and cirrhosa or nepalensis; Thalictrum aquilegifolium and minus; Anemone nemorosa, coronaria, sylvestris, and japonica; Hepatica triloba; Ranunculus flammula, ficaria, arvensis, acris or bulbosus, sceleratus, and aconitifolius; and so on: we should thus give in a small space a very fair idea of the several genera, which will be much improved if we have a pond where we can grow Ranunculus aquatilis, or an alpine border to include Thalictrum alpinum, Anemone baldensis, and some of the alpine species of Ranunculus. If our means are larger, we might add such species as Clematis erecta, sibirica, azurea, and florida; Thalictrum macrocarpum, angustifolium, dioicum, and tuberosum; Anemone apennina, ranunculoides, stellata, vitifolia, virginiana, and alpina; Ranunculus thora, muricatus, philonotis, parviflorus, asiaticus, reptans, chærophyllus, monspeliacus, auricomus, &c.; and our collection is still more satisfactory: but what can be the use to the student of ten or a dozen plants under the names of Thalictrum majus, medium, saxatile, concinnum, glaucescens, elatum, &c., &c., which neither he nor the professor can satisfactorily distinguish from T. minus; or of innumerable forms with the general characters of Ranunculus acris, but labelled nemorosus, lanuginosus, polyanthemos, brutius, Steveni, sericeus, velutinus, &c., which if ever distinguishable in their native stations require a different diagnosis in almost every garden where they are grown? And so it is with all genera which have hardy variable species; they swarm in botanical gardens, monopolising the places and labels of their more distinct but tender allies. How often do we not see eight or ten real or supposed species of Reseda represented by R. alba, lutea, and luteola; at least as many names to Helianthemum vulgare, Isatis tinctoria, Nepeta grandiflora, Stachys germanica, &c., &c.; and as to Asters, Solidagos, Hieracia, Rubi, Potentillas, Heraclea, and such like, the chaos is generally such that the identifying of any one species is perfectly hopeless.

It is argued that the great use of cultivating closely allied forms, whether species or varieties, is to test the constancy of their character, and, when tested, to prove to all the world their value as species, good or bad. This testing of characters may be of great importance as long as it is carried on by the director or curator under his own eye, especially if in a private or reserve garden, where it is easier to guard against accidents and mistakes. He can there raise seeds taken by himself from authentic specimens, and follow the growth of the plant through several years or several generations with a tolerable certainty of its identity, even if it may lose the characters which distinguished the original parent. He has obtained a result which will be admitted by all who rely on his accuracy and good faith, and specimens dried and labelled by him to accompany his notes will be good corroborative evidence to future botanists. But living plants in the herbaceous collections, however satisfactory they may be to the director or curator who has raised and proved them, are of little authority to those who succeed him, when they come to consider how many are the chance of labels misplaced by a labourer, of a sickly specimen having died down and become replaced by a seedling or sucker from a vigorous neighbour without even the gardener's being aware of it, and many similar accidents well known to the practical botanic gardener. The labels of plants require constant checking by a verification of the characters of the specimen; and, if these characters are vague and uncertain, all control over the correctness of the nomenclature is gone.

One consequence of this excessive multiplication of closely allied forms (varieties, races, or allied species) of the more hardy and variable Linnean types, is the great labour which conscientious directors bestow on their discrimination, a labour generally entirely lost, for we very seldom find two gardens where such forms designated by the same names are distinguishable by the same characters.

The first step, therefore, to be recommended for the reform of the generality of botanic gardens is to go through the whole herbaceous collections, root up and throw away every specimen which we cannot confidently name and readily distinguish from its nearest allies, and bestow all our pains on the correct nomenclature and appropriate cultivation of the remainder. Let us always remember that an unnamed plant is useless and bewilders the student, a wrong named one is a positive nuisance as leading him astray.

We have said that annuals and biennials, as well as low shrubs, may well be mixed off with the perennial herbaceous collection. The former certainly give more trouble, requiring usually preliminary raising every year in seed beds in the reserve ground and transplanting into the borders; their number will therefore be restricted where the pecuniary means are small. But the growing them in separate beds saves little expense, and takes much from their utility. As to shrubs those only can be admitted into the herbaceous borders which are naturally small, or can be pruned down to manageable dimensions without losing their characters.

The labelling is a simple but important consideration; the names should be conspicuous, clear, and without useless words. In some gardens the words "class," "order," "genus," "native of," &c., being inserted, only add to the expense, so much so that the labelling never gets completed, or at any rate maintained after having been once done. In the best-named gardens, the name of the natural order stands alone in one word at the head of the order, and to each species is a separate label with the generic and specific names, both at full length. This is strictly speaking sufficient in a purely botanic garden with limited means. A further economy is sometimes practised by writing the generic name only once at full length, and for the other species giving only the initial letter; but that is apt to puzzle the student, and, still worse, to lead to the accidental exchange of labels between genera with the same initials, without immediate detection of the error. Where the means are more ample, the addition of the indigenous name and native country are useful, together with the indication of the application of practical plants, thus:—

> Linum usitatissimum,
> Flax,
> Europe,
> Textile, medicinal, oleaginous.

In some gardens the plants have numbers only, corresponding to a list kept by the director, in which more details can be entered; but this confines the use of the garden to the director himself, or to those few to whom he may lend his list. *G. B.*

It is not uncommon for Pears while they are yet hanging upon the tree to lose their colour in one or two places, gradually acquiring a brown tint and presenting evident symptoms of decay. This may take place where no trace of any wound is visible on the outer surface, and great surprise in consequence is felt at the unaccountable seizure. Such a case has lately been submitted to us, and though a microscopical examination indicates the cause, we are utterly unable to say why it has been exerted in any particular instance or why some fruit on a tree should fail, while other remains uninjured. In the case transmitted, the fruit exhibited two brown patches, one on either side. The evil was clearly derived neither from the stalk nor the eye, which were perfectly healthy, but the most intimate tissues, especially the vascular bundles, whether central or scattered through the flesh, were traversed in every direction with strong and abundant mycelium penetrating the inmost recesses of the cells. The discoloration of the vessels was visible at once to the naked eye, and there was a paler but decided discoloration elsewhere. Though the fruit was placed in the most favourable condition for the development of the mould, it could not be coaxed into the production of fruit, though the mycelium burst out abundantly in little patches in every direction from its surface. In all probability, however, the mould is Oidium fructigenum, a species which is often destructive to Pears and other fruit, as Apricots, Apples, &c.

Our principal object in noticing the subject is to call attention to the fact that in most cases where plants are attacked by mould it is the vascular bundles which suffer the most evidently. In the Turnip, for instance, when decay is induced by mildew the inside of the ducts is perfectly black. The probability is that as these vessels contain air only when perfectly developed, and communicate by means of the superficial organs with the outward atmosphere, they are the medium by which the infection is communicated. In this country, at least, no well instructed observer thinks of solving the

difficulties attendant on the appearance of parasites in apparently closed cavities, by having recourse to the uncertainties of spontaneous generation. Close observation has already cleared up some of the mystery in which the subject of the appearance of intestinal worms in the most unexpected situations was long involved, and we are inclined to think that if any new light is to be thrown upon the appearance of internal moulds, it will probably arise from a closer study of the vessels. The difficulties with which such investigations have to contend can scarcely be exaggerated, but they may not prove insurmountable if proper care and intelligence are exercised. *M. J. B.*

New Plants.

144. ONCIDIUM SKINNERI.

O. (verruciluberculata) pseudobulbis ovatis ancipitibus obsoletè carinatis, folio oblongo-lanceolato basi complicato apiculato subtùs glaucescente scapo ipso valido ter breviore, paniculâ glaucâ apertâ rigidâ ramis ascendentibus simplicibus 5-6-floris dimidiâ inferiore nudâ, bracteis lineari-lanceolatis herbaceis arctissimè adpressis, sepalis obovato-oblongis acutis dorsali erecto lateralibus recurvis, petalis paulò latioribus crispioribus reflexis, labelli lobo medio oblato apiculato subsessili lateralibus angustioribus rotundatis convexis, cristâ corrugatâ inordinatim multi-tuberculatâ dente duplici inæqualiter 3-lobo a fronte altero sæpius emarginato segregato utrinque, c. alis semiovatis denticulatis acutis buccis 2 prominentibus, rostello mutico.

THIS is one of the finest of the yellow-flowered Oncids. Its leaves are 9—10 inches long, the scape more than 2 feet up to the panicle, which is itself 10 inches long by 8 across. The branches of the panicle are covered by a very delicate bloom. The flowers, as large as the largest form of *O. ampliatum*, are a brilliant golden yellow, with about three cinnamon blotches at the base of each division, and a stain of the same colour across the lip immediately below the crest and at the base of its side lobes. The numerous sinuosities of the crest are white. The nearest approach to this in the verruci-tuberculate group is *O. Batemannianum*, from which it differs in the form and colouring of the flower and in all the particulars of the crest. It has just flowered in the garden of the Horticultural Society, to which it was presented some years ago (1849) by Mr. Skinner, whose name it is well worthy of bearing. Its petals being rather broader than the sepals, it may seem that it should have been placed among the *Pentapetalous macropetalous* herd, but it is desirable to admit none into the latter except such species as have their petals very considerably broader than the sepals.

THE PROPOSED ROAD ACROSS ST. JAMES'S PARK.

To the Editor of the Gardeners' Chronicle.

[No. 1.] "Maresfield Park, Sept. 20, 1855.

"Sir,—In consequence of communications which have been made to me by some of my constituents in relation to a proposed road from Pall Mall to the Birdcage Walk, I have felt it my duty, as Parliament is not sitting, to write to the Chief Commissioner of Public Works, for the purpose of ascertaining what the views of Her Majesty's Government are; and as the subject is one of great interest both to those who are opposed to the road as well as to those who are in favour of it, I forward you a copy of the letters which have passed between Sir Benjamin Hall and myself. I have the honour to be, Sir, your obedient servant,

"JOHN VILLIERS SHELLEY."

[No. 2.] "Maresfield Park, Sept. 16, 1855.

"My dear Hall,—I find amongst some of my constituents considerable alarm at the intended new road across St. James's Park. In the absence of Parliament the only course I can adopt for the purpose of acquiring information as to the intentions of the Government, is to write to one of its members, and as the proposed alteration is one especially affecting Westminster, I am anxious that an opportunity should be offered to a deputation to state to you the objections made to the scheme, and to hear from you the grounds upon which you believe the proposed new road would be beneficial to the metropolis at large. Be so good as to tell me when it would be convenient to you to receive a deputation of my constituents, who will be ready to attend upon you at any time.

"Believe me, my dear Hall,

"Yours very truly,

"JOHN VILLIERS SHELLEY.

"The Right Hon. Sir B. Hall, Bart., M.P., &c."

[No. 3.] "Llanover, Sept. 18, 1855.

"My dear Shelley,—I hasten to reply to your letter of the 16th, in which you request information as to the intended road across St. James's Park, in consequence of an apprehension which has been excited in the minds of some of your constituents lest it should interfere with the interests of the inhabitants of Westminster, and in which you also express your desire that an opportunity should be afforded to a deputation to hear from myself the grounds on which it is believed that the proposed new road would be beneficial to the metropolis at large.

"I shall be happy to receive any deputation for the purpose named, on Saturday, 6th October, at at the Office of Works, at 2 o'clock, and meantime I will give you a brief outline of the real facts of the case.

"For some time great inconvenience has been occasioned to persons in carriages (not having the *entrée* to St. James's Park) being obliged to go by Piccadilly and Grosvenor Place from Pall Mall to Pimlico. In the year 1851 the permission to go through St. James's Park was extended; but since which time representations have been made that if a right of way was granted through the Stable Yard it would be a great advantage. The danger of the sharp turning, and the narrow passage at the corner of Cleveland Row and St. James's Palace is well known, and to obviate accidents it was proposed that a road should be made through Lord Sidney's house into the Green Park, and by a turning in front of Buckingham Palace to Pimlico Gate. This route would cut up the Green Park to some extent, merely for the purpose of additional accommodation to those who reside in Belgravia, and that part of the town west of the Birdcage Walk.

"It was considered that if any new road was to be made, it should be so laid out as to afford the greatest possible accommodation to the public at large, and not be constructed merely for the benefit of one comparatively small portion of the inhabitants of the metropolis.

"As Chief Commissioner of Works, I was therefore requested by the Secretary of State to prepare a plan for a line of road, direct from Pall Mall to the Birdcage Walk, by throwing a bridge over the water near the spot upon which a bridge formerly stood, and terminating the road at such a point in the Birdcage Walk as would give a direct road to that densely crowded part of Westminster, which now has only a most circuitous route to the Park and the northern part of Pall Mall, it being considered that such a road, independent of the vast accommodation thus offered to the great mass of the community, would at the same time give easy access to Pimlico and Belgravia on the west, and a shorter road to the Houses of Parliament and Bridge Street on the east, and the whole of the borough of Lambeth, and relieve the immense traffic which during the London season is much too great for Charing Cross. This line, if made, will be open to carriages and cabs day and night, and those who remember the wooden bridge which once crossed the water of the enclosure in St. James's Park, will recollect the great number of pedestrians who passed over it, and profited by the convenience of such a direct connection between the north and the south of the park.

"It has been stated in the public papers that the Government intended to avail themselves of the period when Parliament was not sitting to commence the road and erect the bridge; and it has within the last few days been positively asserted in one of the London journals that the works are already begun! There is not one word of truth in these statements—such proceedings were never contemplated; nothing will be done till Parliament meets: the public will then have an opportunity for considering the plans, which will be presented to the House of Commons; and it will be seen whether the accommodation they offer to the public is the best which should be granted, and whether these plans do not obviate wholly or sufficiently those objections which have been raised against the project.

"The object contemplated by the Government is to make such a line as would be most beneficial to the public in general, but not to construct a road for the convenience of one particular locality. Instructions were given to me with the above view, and I repeat that it was never intended to proceed with any works in relation to this object till Parliament should have had ample opportunity to consider it in all its relations.

"I remain, my dear Shelley, yours sincerely,

"Sir John Villiers Shelley, Bart., M.P." "B. HALL."

NOTES ON TRANSPLANTING.—No. III.

Now while the season in which trees and shrubs that have to be carried long distances may be transplanted with a fair prospect of success, or even such as occupy but a day or so in their transit, must of necessity be comparatively limited; where they have to be removed merely a few hundred yards at most, the circumstances are very different, and will allow transplanting to be carried on, at least in a limited degree, during the greater part of the year. It is often of much importance to do this. That it may be safely accomplished, the directions and examples to be presently given will show.

In laying down rules for guidance in any operation, it becomes exceedingly difficult to particularise between the general and the special. In fact, it is almost impossible to do so; something must always be left for experience to ascertain. And it is in consequence of those who seek guidance from such principles expecting too much from a mere rule of thumb application of them, that complete failure is so often experienced, or at least that the true value of such principles is so seldom ascertained.

These observations are not only applicable to the theory of transplanting, but to every other operation of which the principles can (and it would be difficult to name one of which they could not) be conveyed in a written treatise. Thus most persons who know anything about planting at all will have learned that evergreens should be transplanted in autumn, or under certain conditions in spring; and that deciduous trees and shrubs should be removed at some period between the falling of the leaf in autumn and the swelling of the bud in the following year. These may be considered as the broad principles, which, if duly and properly carried out in practice, all other circumstances being favourable, will be productive of much success. But as regards both evergreens and deciduous plants these principles may be practically violated to a wide extent; with the former, however, much more than with the latter. It will be borne in mind that the observations and illustrations now to be given have sole reference to plants that can be replanted immediately after being taken up. And first of deciduous kinds.

Somebody—in the *Gardeners' Chronicle*, I think—once recommended as a principle that deciduous trees should be transplanted when in full leaf†. This advice, taken in a general sense, as it was by more than one person, is simply ridiculous, and in practice would lead, as I know it did, to most disastrous results. But if understood as only partial in its meaning, and as applicable only to certain plants, and those to be removed under certain conditions, it becomes in a measure valuable, and may be safely followed.

At the end of June in the present year I determined on moving two large plants of Forsythia viridissima which were monopolising too much space in a bed of small flowering shrubs in my own garden. In the places which I intended them to occupy, holes were dug and well watered. The plants being put in, and sufficient soil thrown upon the roots to cover them, another good watering was given, and the remaining soil filled in. The plants were growing luxuriantly at the time; nevertheless they gave no indications of being injured. In fact, not a leaf drooped. Of course growth for the season was checked, but that was rather an advantage than otherwise, for it induced short sturdy shoots, which, in a Forsythia, constitute perfection. Obtain these and you have flowers in abundance.

Now, the success of these plants depended in no small degree on the peculiar character of their roots. They have an abundance of succulent fibres which, if the plant is at all carefully removed, are ready to resume their functions immediately after transplanting; and those of the plants in question being supplied with plenty of moisture, and kept out of the ground but a short time no material check was given. In transplanting under similar conditions this is an important point to attend to; and, in fact, under any circumstances whatever, it should be kept in view.

Of course there are many other deciduous shrubs than the Forsythia, which, if necessary, might be transplanted in summer with perfect safety. Plants with long woody roots having but few fibres, and those principally at the extremities, it would be hazardous to experiment upon; but such as have an abundance of succulent rootlets, principally within a foot or two of the base of the stem, may with proper care be as successfully transplanted in summer as at any other season. Recollect it is not recommended to transplant any shrub or tree in summer in preference to autumn, but where circumstances render it necessary or advantageous to do so, it may with certain plants be ventured upon with perfect safety.

Evergreens, as before hinted, afford much more scope for variation in the periods of removal than deciduous shrubs and trees. It would be difficult to name a month in the whole year when some of them may not be transplanted with success. Much will however, of course, depend upon the condition of the individual to be removed. If it has occupied its situation for a series of years, and has consequently become coarse rooted, it is hardly a fit subject to be transplanted in summer. In fact such a plant would require very careful treatment if removed at the best of all seasons, autumn, and under the most favourable circumstances, to give it a chance of success. Plants so circumstanced mostly require a special course of education to fit them for a change of place when advisable to transplant them at all.

But such as are of a reasonable size and in a good moveable condition may be transplanted successfully at widely different periods of the year. Thus Conifers may be transplanted safely when the young shoots are 3 or 4 inches long and in a succulent state, provided proper precautions are taken and plenty of water given at the time. I recollect an instance where some hundreds were moved in the middle of June, and a very hot June too, with hardly the loss of a plant. Nor were they in the best possible condition at root either for such an experiment. However, circumstances rendered it necessary that they should be moved, and moved they accordingly were. Each plant as it was taken up was dipped as described in a former page, and also well wetted at root when planted. The young shoots drooped beneath the sun for a day or two, but in the course of a week the plants were established, and the general result was all that could be desired. Again, in order to finish the planting of a new garden it was necessary to carry on the work far into the spring. The last plants removed were some common Laurels, five or six feet in height. The ground was loose and gravelly, and prevented anything like a ball of earth being secured with the roots; in fact, when each plant was taken up all the earth fell away, leaving the roots wholly bare. Great care was exercised to preserve, as far as possible, the succulent and active rootlets, which were in abundance, from injury.

The plants were removed about the sixth of May, when the young shoots had pushed several inches in length; nevertheless, not one plant died; nor, indeed, did any receive much damage. A few showery days succeeded their removal, and doubtless contributed much to their success. If it is urged that such natural conditions can rarely be calculated on, and that planting at that season is consequently not generally practicable, it must be admitted that the results of such experiments teach us under what various conditions planting may be carried on, and that in a limited practice at least, these conditions may, to some extent, be given artificially.

The Evergreen Oak is perhaps one of the most difficult trees to transplant successfully, yet, if the proper conditions be secured it succeeds well enough. I once saw a number, a week or two after their removal, that had been transplanted in May, when their young shoots were an inch or two long. Hardly a plant had failed. I learned that they had been well dipped at root and copiously watered when planted. In Guernsey, where the Evergreen Oak is much employed for shelter on the most exposed places—where, in fact, it is often covered with salt spray—they remove large specimens of it with perfect safety at midsummer. If the plant to be removed has a very large head in proportion to the roots some of its branches are shortened back, but no other precautions are taken to ensure success. A failure is very rare indeed. The damp climate of the island of course contributes mainly to this success; for no newly-planted tree suffers more from the effects of evaporation from its leaves than the Evergreen Oak. When subjected to a dry atmosphere with a feeble root action, as a recently planted tree would naturally be in our climate, then speedy dissolution from dessication of the tissues would almost certainly follow.

Now this evaporation from the leaves and succulent branches of newly-planted trees is the primary cause of their failure, and in proportion as it can be guarded against or compensated for, so will success be found. Deciduous trees when moved, as they must generally be, when the leaf has fallen, are, of course, not subject to the draining of their juices by evaporation to a like extent—a condition which gives them in some respects

* An old gardener with whom I was well acquainted was regarded by his labourers and pupils as foolishly nice in such matters, and it was only with great difficulty that he could prevail upon them to employ the necessary time and labour. The result, however, was evidently so good, that one of the most restive has often told me since that he is convinced that no labour is more profitable.

† Since this was written I see another correspondent has advocated a like practice.

an advantage over evergreens in sustaining the casualties of transplanting.

Now nothing favours evaporation so much as a dry *moving* atmosphere; as, for instance, during bright windy days in March. From this circumstance that month is deemed, and rightly too, the worst in which to transplant evergreens throughout the year. No one who can possibly avoid it should attempt it then. It is easy to imagine that, from the constant passing away of the fluids of a plant with no means of replenishing them, the individual must soon cease to exist. And in March, too, vegetation is often as inactive as at midwinter, which circumstance, coupled with its invariably dry atmosphere, is an additional reason for not planting then.

When a shrub or tree is transplanted it should be under conditions which will allow it to recommence growth immediately, to enable it, by absorbing at the roots, to counteract the loss of fluid at the leaves. To ensure this the plant must be removed before it is completely at rest in the autumn, or after vegetation has commenced in spring. At either of these periods nature immediately sets about repairing any injury which the plant may have received. The roots which are destroyed, and many will inevitably be so, are then replaced by others, the work of nutrition goes on, and the natural functions of the plant are resumed.

If you examine a shrub that has been transplanted while vegetation was active in autumn, even a few days after its removal, you will perceive the roots covered with myriads of white shining points; the new rootlets in fact hastening to re-establish the plant before winter sets in and renders the vegetative principle all but inert. Plants require both at root and branch a certain degree of warmth to enable them to fully perform their functions. In autumn the soil retains a considerable amount of heat, and is favourable to the formation of roots.

In mid-winter this is not apparent, even though the weather should be open, for the soil has lost the greater part of its acquired warmth by radiation then, only to be again obtained from the returning sun in spring. Plants removed in spring are in conditions somewhat analogous to those transplanted in autumn. Vegetation not being dormant, their roots are immediately formed, and the plant is not materially checked. The great drawbacks to spring planting are the daily increasing power of the sun and the periods of dry weather which are frequently experienced at that season. Where plants are coarse rooted and have to be carried a long distance, spring planting becomes hazardous, and great care will be required in its execution if attempted then. *G. W. L.*

Home Correspondence.

Sulphured Hops.—You have already so well exposed the folly of supposing that sulphur applied to the Hop during the period of its growth could communicate any taste to beer, that it is needless to add anything on the subject. It might, however, be worth while inquiring whether the sulphur used in such large quantities as it is during the drying of the Hop may not produce the effect complained of. I am credibly informed that one grower in this place has ordered no less than 10 tons; but, without pledging myself to the truth of this statement, I may state this as a fact, viz., that it is impossible to drive through the town of Farnham without the most unpleasant taste being produced and a feeling of suffocation experienced. The sulphur is added for the sake of making the Hops look more bright; in other words *for the sake of deception*, and if factors would turn their attention to this subject, and protest against the use of sulphur in Hop drying, they would, I believe, confer a real benefit upon brewers and their customers. *An Observer, Farnham.* [We entertain no doubt that the mischief complained of by the brewers is committed in the oost house, in which sulphur should not be permitted. We have ascertained that a very large quantity of impure sulphur, smelling strongly of sulphuretted hydrogen, has found its way into the Hop districts—and there doubtless is the source of the evil. Hop factors should refuse to buy Hops sulphured in the oost house. There would be reason in that, and there is no good reason to the contrary.]

Chloroforming Bees.—The method you recommend (see p. 552) of using chloroform in taking honey from bees I have practised with success, having followed the directions closely. It is a matter of great importance to preserve the bees alive here, their working season being so short; I intend to use chloroform always. *John Conlon, Stornaway Castle, Island of Lewis.*

What Constitutes a Nurseryman?—In your Number of the 15th inst., p. 616, I see in answer to "H. B." you say—"A man is not a nurseryman or grower for sale if he merely raises a flower and sends it out himself; we should regard him as an amateur, and place him accordingly." I imagine the case cannot have been put in its real light or you would not have given such an answer. The facts are these: Our society is divided into growers for sale and private growers. Now the party in question raised a seedling, named it "Incomparable," offered it to several nurserymen who would not give him so much as he wanted for it, whereupon he says, 'I will retail it myself'—and did so, selling plants struck this spring at per plant, and not the whole stock to one man; and is then allowed to show Dahlias in the private growers' class. If not too much trouble I shall esteem it a favour if you will let me know if you are of the same opinion; *i. e.*, if I raise seedlings and retail them, can I show in the private growers' class in London? *John H. Hill, The Oil-mills, Ipswich.* [We think not. The case was not put in this form in the first question put to us.]

Transplanting at Midsummer.—I observe that Mr. Scott, of the Merriott Nurseries, Somerset, asserts that it is better to transplant the numerous varieties of trees and shrubs he mentions at midsummer than to follow the ordinary way of proceeding. I am not going to say that Mr. Scott did not plant at such a time, or that his success was otherwise than he describes; for I am aware that such operations may be carried on at nearly any time of the year, but I cannot agree with him that midsummer is best for the operation, even supposing that the weather is not sufficiently dry to cause the plants to suffer from want of moisture; for with the ordinary care bestowed in lifting, a plant must receive a great check when moved in full growth, and consequently, to say nothing of other disadvantages, it must lose a portion at least of the time allotted to it by nature for the formation and ripening of its wood. Mr. Scott I understand has been in the nursery business about five years, and no doubt he will, as I have done after 40 years' experience, find out that October and November are the best months for planting; and also that advertisements look much better and have more weight with the public when properly inserted in the *Gardeners' Chronicle* or elsewhere, than in the shape of Mr. Scott's letter, for in my opinion as well as that of many others, Mr. Scott's article on "Transplanting" is an advertisement of his stock and nothing else. *An Old Woodman.*

New Belgian Strawberry (see p. 614).—Your correspondent's plants which did not bear this year probably failed from having been planted on very light land; or in his part of the country the autumn might have been wet, which, instead of inducing the plants to ripen their flower-buds, might have caused them to grow into leaf. This frequently happens with large fruiting Strawberries in very light soils, and it will even take place in loam the first year, when it has been dunged and trenched up, but as soon as the loamy soils get more solid the plants go on bearing every year. If growers of Strawberries wish to succeed in very light soils, after dunging and trenching they must tread all as solid as the feet well can do, making allowance for wet or dry weather; then plant the Strawberries. When I lived with the present Earl of Harrington, then at Cedar Lodge, Putney, some 25 years ago, the soil there was light and sandy. I tried all I then knew to make Strawberries succeed, but they always failed, until by mere chance I turned some plants that had been forced out of pots with their balls entire; these produced a famous crop the second year; but the third year they rooted out of the old balls and got into the sand, and bore no fruit at all that year. In 1834 I lived in another light sandy garden at Broom House, Fulham. I followed the same plan of turning out the plants after they had been forced. They had been grown in Wimbledon loam; and I think that it was while I was with Mr. Sulivan that I discovered the value of the plan of treading the ground, after dunging and trenching, as hard as a road, in proof of which I may mention that after the Strawberries have borne their crop, in order to get plenty of good runners I have had the ground forked between the rows to enable them, as I then thought, to grow quicker and get more easily into the ground. I soon found, however, that by not forking at all, but by leaving the soil trodden as it had been in gathering the fruit, the plants always produced the best and earliest rooted runners. Yesterday, upon having a piece of ground well dunged and trenched, an Irishman who did the work asked of the lad who was treading it before planting—"What is the use of trenching ground and then treading it as hard as it was before?" One thing, however, is certain, viz. that the Strawberry plant will not thrive unless the mould is very firm for the roots to grow in, and then it matters little what sort of mould is employed. I have lived these 16 years where I now am, and what with dunging heavily and annually putting on the ground the Cucumber mould out of the pits, my Strawberry ground is now the lightest round London, and I am obliged to adopt all sorts of plans to keep such ground in good bearing and without any rotation of crops. There is one more plan which I practise, and that is, every spring I have prepared a large quantity of rotten dung, and throw it over the beds to the depth of an inch; this is very beneficial to the crop. The plants immediately make fresh top roots, and are more able to bear a large crop, as well as swell the fruit to its utmost size, and if this plan is adopted annually the same plants will last for many years. I have a large Pine of Black Prince at least nine years old, as well as a Pine of Prince of Wales six years old, and every succeeding year they bear enormous crops. *James Cuthill, Camberwell.*——I beg to say that from the favourable report which was made in your columns of the Delices d'Automne, I was induced to purchase a few plants, but to my great disappointment I have experienced exactly the same result as your correspondent. The plants, which have done well this summer, are now showing no fruit whatever, which it was stated they would do; on the contrary, they are throwing out abundance of suckers, which it was stated they would not do. *Henry Manton, Sleaford.*

Hylurgus Piniperda.—In Ratzeburg's "Forstinsecten" several instances are given of this beetle having been effectually kept in check by means of decoy trees laid in the parts of the Pine wood affected in the months of March and April and removed and destroyed in June and July, whilst containing the larvæ and pupæ. Some other modes of attacking the insect are mentioned, such as the removing and burning of the bored twigs which have fallen from the trees in August and September; but most importance is attached to these decoy breeding-trees, and to the careful clearing of the plantation in June and July of all felled Pine stems and branches, and especially of all sickly and over-ridden plants, which last are chiefly selected by the insects as breeding places when they leave their winter quarters in March and April. Ratzeburg says he is satisfied, from long continued observation, that there is only one brood annually of this species, and that the beetles rarely if ever winter in the perforated twigs, which either remain on the trees or fall to the ground in autumn; but that they pass the winter in the bark of those roots which are covered with Moss at the base of the Pines. If this is correct, and if, as is said, the beetles are found not isolated but in quantities together, might it not be practicable in small plantations to destroy them in winter, after removing the Moss, by means of some liquid which would not injure the trees, as perhaps lime-water or urine? *W. S.* [No; unless corrosive sublimate could be given them.]

Filter.—Can any of your correspondents favour me with directions how to construct a filtering tank to filter and hold rain-water for domestic uses. What are the best materials for filtering large quantities of water for such purposes, and how many filtering chambers should there be. Should the reservoir to receive the filtered water be air-tight? Useful instructions on these points will oblige. *C. C. C., Milton, Abingdon.* [You will find directions for constructing a very good filtering tank at p. 102 of our Vol. for the current year.]

Orchard Houses.—Having read Mr. Rivers' "Orchard House, or the Cultivation of Fruit Trees in pots under Glass," I determined to visit Sawbridgeworth and judge for myself of the feasibility of the plan. Having for many years lost our crops of wall fruit from spring frosts, and from the lateness of this season having few Peaches and Nectarines perfectly ripened, I last week visited these nurseries, and I can only say that I was more than satisfied. I minutely inspected this system of cultivation, and can not only bear testimony to the truth of all Mr. Rivers has stated in his little work, but can conscientiously affirm that what I saw exceeded my expectations. The small trees are in 11-inch pots, loaded with fruit of large size, perfect in colour and flavour, the trees looking exceedingly robust and healthy; the new shoots, although very luxuriant, are well ripened and not at all drawn up, the trees being Peaches, Nectarines, Apricots, Pears, Plums, and Figs, which, although bearing abundant crops, I am informed from the ripened state of the wood are capable of bearing the same crop every season, the chief art being perfect ventilation and root pruning, which is conducted on a most simple method, the roots being allowed to grow through the bottom of the pot into a shallow border of compost, from which their chief nutriment is derived; if the growth become too luxuriant, the pot is merely tilted on one side, by which means both the size and growth of the tree is regulated with the greatest nicety, and after the leaves have fallen off and the plant becomes in a dormant state, the pots are removed from the borders and stowed away into close winter quarters, where they require no further care or attention, the hardest frost appearing not to affect them. These houses, although admirably answering the intended purpose, were constructed at surprisingly low prices, some of them, with Beech hedges forming the sides, at not more than 12*l.* each. Being thoroughly convinced of the advantages to be derived from this system, I have determined on building two houses 110 feet long, and I find by adopting the plans laid down in the "Orchard House" I can construct them at a most trifling price; and having by me a stock of fruit trees purchased last winter from Mr. Rivers, I look forward to an abundant crop next season, the trees from previous cultivation having thriven beyond my expectations. A visit at this season of the year would amply repay any one interested in this most delightful of all systems of horticulture; they would also see 90 acres of Rose and fruit trees of the choicest description, the latter laden with fruit to the earth of the deepest and richest colour; and the same originality of ideas would be perceived all through, carried out in the most judicious and skilful manner, affording food for contemplation for many months afterwards. *S., Newington.*——I can bear ample testimony to the usefulness of orchard-houses; I had one erected at this place, on Mr. Rivers's plan, late in the autumn of 1853—it is 85 feet in length and 13 feet 6 inches in width. I purchased at the same time 80 Peach and Nectarine trees, all except 12 maiden plants; I potted them in accordance with the rules laid down by Mr. Rivers in his little work on the Orchard-house. The plants cost 12*s.* per doz.; I cut them down in the usual way, potted them in 14-inch pots, and treated in every respect according to Rivers's directions, and this year they are bearing a most splendid crop of fruit; I have at least 120 dozen of fine full-sized Peaches and Nectarines of first-rate flavour and quality. Figs I have not found to succeed so well, they bear abundantly but drop a great deal of their fruit just when beginning to ripen; notwithstanding this, however, they have ripened a tolerably good crop. Apricots have not yet been tried; they were only potted last spring, but they have made fine wood. Strawberries I have found to ripen perfectly; I place them in the vacancies between the trees, a situation in which I bloom all my forcing Strawberries after the beginning of March, and then I remove them into heat. I also keep the whole of my

bedding plants that are established in the same place, after all danger of such severe frost is over as would be likely to penetrate through the glass. Last year I hardened off 5000 bedding plants in this way. Orchard-houses are also first-rate places for protecting winter salads in after the plants are dried off and put to rest—they then occupy but little space. *J. Daniels, Gardener, Swyncombe House, Henley-on-Thames.*

Notices of Books.

Meteorological Essays. By François Arago. With an Introduction by Baron A. von Humboldt. Translated under the superintendence of Colonel Sabine, R.A. Longmans. 8vo, pp. 504.

In this insular variable climate the weather is the great subject of everybody's attention; and all works relating to it are welcome to the English public. Will it be fine? Will it cease raining? What sort of weather shall we have to-morrow? Can we reckon upon a Queen's day? Is the next month likely to be fair or stormy? These and a hundred similar inquiries are heard everywhere, and are constantly repeated; for no one knows with certainty how to answer them. A work then by such a man as Arago, although relating to only a small portion of the weather subject, will be read with interest as well as with the respect due to so great a name.

More than half the volume before us is occupied by thunder and lightning. About another hundred pages treat of the aurora borealis, and the remainder relates to electro-magnetism, animal electricity, and terrestrial magnetism. Each of these questions is illustrated by a crowd of facts patiently gathered from an infinite multitude of sources, and constituting a set of data with which all theories must be reconcileable if true. Many of the relations are extremely curious, while all are made to have a direct bearing upon the points they are intended to elucidate.

Our scanty space forbids our doing more than concisely touching upon some of the questions discussed in that division of the work which is assigned to thunder and lightning. It is a disputed point whether lightning occurs without thunder or the reverse. M. Arago is scarcely able to answer these questions.

"The phenomenon of lightnings without thunder, with a perfectly clear sky, is too well known, and rests on too general experience for it to be necessary for me to cite on this point the testimony of any particular meteorologist. Who, indeed, in our climates has not seen and remarked 'heat-lightnings?' Bergman tells us that in Sweden, where they are also very common, the peasants call them 'Barley lightnings' (korn-bleck), because they are usually seen in August, when the Barley is beginning to ripen.

"It is by mistake that it has been asserted that heat-lightnings always remain near the horizon. Their light sometimes overspreads the whole visible extent of the heavens. This remark will not be without its use when we come to inquire whether heat-lightnings have an independent existence, or are only the reflection of other lightnings.

"Seneca asserted that thunder sometimes takes place without lightning. (*Quæst. Nat.* lib. ii. § 18.)

"I am ashamed to have to confess that as respects Europe I am almost reduced to Seneca's statement. Thunders without lightning, notwithstanding the points of theory on which they might afford solutions, have but little excited the attention of observers. The citations which I am enabled to make from other parts of the world leave, I think, little room to doubt the reality and generality of the phenomenon.

"Thibault de Chanvalon wrote in October, 1751, in his register of meteorological observations at Martinique:—'Of eight days in this month on which it thundered there were two days *without lightning.*' In November, I read:—'Thunder only on one day; three rather strong thunderclaps, but *without lightning.*'

"On the 19th March, 1768, near Cosseir, in the Red Sea, a violent thunder-clap spread consternation among the crew of the small bark on which the traveller James Bruce was proceeding. This thunder-clap *had not been preceded by any lightning.*"

The precautions which may be adopted by persons afraid of lightning are described as follows:—

"Franklin has given some precepts for the use of such persons who, during thunderstorms, are in houses not provided with lightning conductors.

"He recommends them to avoid the neighbourhood of fire-places. Lightning does indeed often enter by the chimney, on account of the internal coating of soot, which is one of the bodies for which, as for metals, lightning evinces a preference.

"For the same reason avoid, as much as possible, metals, gildings, and mirrors, on account of their quicksilver.

"The best place is the middle of the room; unless, indeed, there should be a lamp or chandelier hanging from the ceiling.

"The less the contact with the walls or the floor, the less the danger. A hammock suspended by silken cords in the middle of a large room would be the safest place. In the absence of means of suspension, the next best place is on substances which are bad conductors, such as glass, pitch, or several mattresses.

"According to Nollet, with similar elevations, and all other circumstances equal, spires and steeples covered with slates are more often and more violently struck by lightning than those which are built of stone.

"I do not think that the cause of such a difference should be sought in some specific difference between the substance of the slate and that of the stone. It would be more likely to be found in the humidity which, during heavy rain, so easily penetrates between the slates to the timber and laths on which they rest, and to the number of iron nails employed in fixing them.

"The greater the mass and the volume of the conducting matter brought together in one place, the greater the chance of being struck by lightning in its neighbourhood. This being once admitted, since living man is a sufficiently good conductor of the fulminating matter, ought we utterly to reject the opinion of some able physicists (of Nollet, for example), who think that the danger of being struck by lightning in a church increases with the number of persons assembled there.

"There is another cause which may contribute to render numerous assemblages of men or animals dangerous during thunder-storms. Their perspiration cannot fail to occasion an ascending column of vapour; and, as it is well known that moist air is a better conductor of lightning than dry air, such a column has a natural tendency to attract the lightning by preference to the place from which it proceeds. Need we therefore be surprised that flocks of sheep are so often struck by lightning, and that a single stroke should sometimes cause the death of 30, 40, and even 50 of those animals?

"In America it is a generally received opinion, that barns full of grain or of forage are more often struck by lightning than other buildings.

"This circumstance would also seem to be attributable to an ascending current of moist air, of which the origin may be easily accounted for, since crops are usually housed before they have arrived at a state of great dryness.

"It sometimes happens that one person in the midst of a numerous group is struck by lightning, without the determining causes of this kind of selection being at all discerned,—without the sufferer wearing more metal about his person than the rest of the party, and without his position relatively to surrounding objects presenting any apparent peculiarity.

"I say any *apparent* peculiarity, because a cause may be active without being apparent; for a mass of iron concealed in the thickness of a wall produces just as much effect as if it was uncovered, &c. It can very rarely happen that it can be safely affirmed, that all circumstances were identically the same in the situations occupied by the persons struck and those who were spared. The latter may have been further from some mass of metal, water, &c., existing, concealed and unsuspected, under the floor, behind a wainscot, in the earth, &c.

"It would seem difficult to arrive, in this manner, at discovering whether there are any specific differences between different individuals in their degree of liability to being struck. This doubt could only be elucidated by the aid of indirect experiments, which will be examined in a future chapter. In this place I content myself with saying that there are specific differences; and that, during a thunder-storm, in situations perfectly similar, one man may, by the nature of his constitution, be in greater danger than another.*"

Differences of opinion still exist here and there as to the true value of lightning conductors. From very early times it has been believed that the effects of lightning might be averted.

"Herodotus (book iv. chap 94), relates, that when it thunders and lightens the Thracians are in the habit of shooting arrows against the sky, to threaten it. Remark that he distinctly says 'to threaten it.' There is no question at all of the power which the arrow, being metallic and pointed, would have of taking from the clouds some little portion of their fulminating matter. This is so clear, that even the fanatically-ardent admirer of antiquity, Dutens, drew back from the idea of assimilating the Thracian arrows to the lightning-conductors of modern times, and from making the invention of Franklin's apparatus go back to the time of Herodotus."

"In the 15th century, a naked sword was placed at the mast-head of ships to turn aside lightning from them. St. Bernardine of Sienna, who has been the means of transmitting the knowledge of this custom, speaks of it as a prejudice. (Laboissière, *Academie du Gard*, 1822.)"

"Ctesias of Cnidos, one of the companions of Xenophon, relates, in a passage which has been preserved to us by Photius, that he had received two swords, one from the hands of Parisatis, mother of Artaxerxes, the other from those of the king himself; he adds:—'If these swords are planted in the ground with the point uppermost, they drive away clouds, hail, and thunder-storms. The king,' he goes on to say, 'made the experiment in my presence, at his risk and peril.'"

"In the time of Charlemagne, it was usual to put up long poles in the fields to drive away hail and thunder-storms; but lest fanatical admirers of old times should see in this practice an anticipation of Franklin's lightning conductors, I hasten to add that the poles were not to be efficacious unless they were surmounted by pieces of paper. Such papers or parchments were no doubt covered with magic characters, since Charlemagne in proscribing this practice, in a capitulary of 789, described it as superstitious."

At last we have the experiments of Sir Snow Harris and others which have ended in the present system of trusting to sharp-pointed metallic rods as certain means of attracting and nullifying the action of lightning. The explanation of this is given by Arago with admirable clearness and conciseness.

"All other circumstances being equal, lightning directs itself, generally speaking, by preference to the most elevated portions of edifices. It is there, consequently, that the preservative means, whatever they may be, should be applied.

"All other circumstances being equal, lightning directs itself by preference to metals. When, therefore, a metallic mass occupies the most elevated point of a house, we may feel pretty nearly certain that lightning, if it falls, will strike that point.

"Lightning which has entered a metallic mass only does mischief to surrounding masses at the moment when it quits the metal, and in the vicinity of the point or points at which it issues from it. A house may, therefore, be rendered safe from its highest point to its foundations, if the metallic parts of the roof are prolonged without interruption to the ground.

"Damp earth offers to the fulminating matter which is passing along a metallic bar a channel by which it escapes easily and without effort, without detonation, and without producing any kind of damage, providing the bar plunges a little deeply into the earth. By carrying the continuous bar which has already preserved from injury the exterior of a building down some way into the ground, which is always damp, the foundation, and, speaking generally, the whole subterranean portion of the building will be similarly preserved."

In like manner he deals with paragrèles or apparatus for averting hail.

"The formation of hail appears to be indisputably connected with the presence of an abundant quantity of fulminating matter in the clouds. Withdraw that matter, and the hail will either not be formed, or will remain in its rudimentary state, so that all that falls will be a harmless, extremely minute hail or sleet. Does any one doubt the great benefit which, in some countries, agriculture would receive from the disappearance of hailstorms? I reply, that in 1764 an enlightened inhabitant of the south of France wrote in the 'Encyclopedia,' 'There is hardly ever a year in which hail does not ravage the half, and sometimes three-quarters, of the dioceses of Rieux, Comminges, Conserans, Auch, and Lombez.' The single storm of the 13th of July, 1788, smote in France 1039 communes. An official inquiry made the damage amount to 25 millions of francs (one million sterling)."

Instead of kites or other contrivances of that kind Arago makes a very different though analogous suggestion.

"What I would wish is, that captive balloons should be resorted to for this great and important experiment. I should wish them to be sent up to a much greater height than that attained by Romas's kites. If by rising 300 or 400 feet above the elevations ordinarily reached by the upper extremities of the rods of lightning conductors, there were obtained, instead of little plumes or tips of flame, flames 10 or 12 feet long, what may we not expect would happen when the whole apparatus, having risen to a height three, four, or ten times as great, according to circumstances, would almost graze the under surface of the clouds? and when, moreover (and this is an important particular), the metallic point which is to attract the fulminating matter, and which would be in communication with the long semi-metallic cord which officiates as conductor, being fixed on the upper part of the balloon, is presented to the clouds nearly vertically, or in the position of the rod of an ordinary lightning conductor? It does not appear to me that there would be anything too bold in supposing that it might be possible to dissipate the most violent thunder or hail storms by such means. At all events, an experiment so highly and directly interesting both to science and to the agricultural wealth of countries is well deserving of trial. If balloons of moderate dimensions were employed, the expense would certainly be less than the Vine-growing districts now expend uselessly in firing so many guns and mortars."

Our last extract must be that which relates to the organs which are most usually affected in deaths or injuries occasioned by strokes of lightning.

"John Hunter said, that lightning in traversing the body produces an entire and instantaneous destruction of the vital principles. I must be pardoned for saying that this is but repeating known facts in obscure terms. According to Brodie, death follows from the action of the lightning matter on the head.

"Edwards considered death caused by lightning to be the result of a disorganisation of the nervous system. Others confine the action to the cerebro-spinal system,

* "The matter which darts in sparks from the conductor of an electric machine after the plate has been turned for some time, is fulminating matter. Like fulminating matter, or lightning, it is transmitted almost without loss of power through great extents of metal, water, &c. It also traverses pretty freely a number of men joined hand in hand, and forming a chain. It is, however, found that there are some persons who abruptly arrest, or even form an obstacle to, the communication, and who do not feel the shock, even if placed next to the first person in the file. Such exceptional persons must be classed exceptionally among the non-conducting or imperfectly-conducting bodies which lightning respects, or at least rarely strikes.

"Such strongly marked differences imply intermediate shades. Now every degree of conductibility corresponds during a thunder-storm to a certain degree of danger. A man, who should be as good a conductor as a metal, would be as liable to be struck as a mass of metal; a man who would interrupt the transmission of electricity when forming one of a chain, would be almost as little likely to be struck as if his body were of the nature of glass or of resin. Between two such extreme cases there would be persons whose liability would be similar to that of wood, of stones, &c. Thus it would seem that the place occupied by each person is not the only influential circumstance: the physical constitution of the individual may also have some share in the result."

but without however citing any decisive experiments in support of their opinions.

"Lightning produces on animated bodies struck by it considerable mechanical effects, which for the most part have some manifest relation to the portions of metal disseminated in the clothing of the sufferer. Sometimes the marks left by the lightning are merely superficial, being entirely confined to the skin; under other circumstances the very bones are broken. A case has even been reported in which the skull of a man struck by lightning appeared as if it had been crushed by a heavy bruising instrument. It is not uncommon for the clothes of the person struck to take fire.

"It has been said on the authority of Hunter, but without sufficient proof, that the blood of a man or of an animal struck by lightning does not coagulate in the body, and that the muscles never acquire the rigidity of an ordinary corpse; but this assertion is shown to be incorrect by authentic anatomical examinations and dissections made by Schultes of Landshut. It has also been said that in this kind of death putrefaction manifests itself sooner than usual.

"When it happens that the person struck to death by lightning had about him a knife, needles, or anything made of steel, the powerful magnetism which is at the same time imparted to those objects is perhaps the most evident proof which a surgeon or magistrate could receive of the nature of the fatal accident.

"Instances have been cited in which strokes of lightning, not sufficiently strong to cause death, had occasioned deafness, or had produced amaurosis, with dilatation of the pupil and loss of its power of contraction. In some cases the deafness or the amaurosis very soon disappear; in other instances they have lasted several days, or for several weeks.

"The most frequent result of strokes of lightning of moderate intensity is partial paralysis, more or less persistent, of the legs or arms.

"Mr. Edouard Robin attributes death occasioned by lightning to a kind of asphyxiation, or a sort of sudden disappearance of atmospheric oxygen. He thinks he finds a confirmation of his theory in observations made by an Italian physician, from which it would follow that in the body of a person whose death has been occasioned by lightning, putrefaction is, comparatively speaking, but little active."

With curious and useful matter like this the volume before us is filled to overflowing. Let us add that it is well translated, and that no library can be even tolerably complete without it.

Miscellaneous.

The late Mrs. Lawrence's Plants.—The sale of these commenced on Tuesday last, and will finish to-day. What kind of prices they realised may be gleaned from the following: Orchids.—A splendid specimen of Saccolabium guttatum fetched 31*l.* 10*s.*; S. retusum, 12*l.*; Cattleya labiata, 11*l.*; Phalænopsis amabilis, 27*l.* 6*s.*; P. grandiflora, two fine plants, 17*l.* and 14*l.* 10*s.*; Dendrobium anosmum, 12*l.*; D. Devonianum, 10*l.*; Vanda suavis, 22*l.* 1*s.*; Aerides Larpentæ, 14*l.*; A. maculosum, 13*l.* 10*s.*; Odontoglossum citrosmum, 12*l.*; Cypripedium Lowi, 8*l.* 8*s.*; C. caudatum, 6*l.* 6*s.*; C. barbatum, 5*l.* 5*s.*; Angræcum eburneum, 5*l.* 15*s.*; Epidendrum macrochilum album, 6*l.* 10*s.*; Coryanthes macrantha, 6*l.* 5*s.*; Trichopilia tortilis, 8*l.*; T. coccinea, 3*l.* 3*s.*; Phaius Wallichi, 8*l.* 10*s.*; Calanthe veratrifolia, 4*l.*; Lælia purpurata, 5*l.* 15*s.*; Chysis bractescens, 5*l.* 10*s.*; other lots, of which there were in all about 330, fetched from 1*l.* 1*s.* to 4*l.* per lot. Stove and Greenhouse Plants. Amherstia nobilis, 10*l.* 10*s.*; Dipladenia crassinoda (two plants), 2*l.* 2*s.*; Stephanotis floribunda, 2*l.* 2*s.*; Allamanda grandiflora, 2*l.* 10*s.*; Ixora coccinea, 2*l.*; Curcuma Roscoeana, 2*l.* 8*s.*; Pimelea spectabilis, 5*l.*; Hedaroma tulipiferum, 3*l.* 7*s.*; Gompholobium polymorphum, 3*l.*; Chorozema Henchmanni, 3*l.* 5*s.*; Adenandra fragrans, 4*l.* 15*s.*; Leschenaultia biloba, 2*l.* 12*s.*; other lots from 10*s.* to 30*s.* per lot. Azaleas.—A. Perryana, a very fine plant, 11*l.*; Juliana, 5*l.*; Glory of Sunning Hill, 3*l.*; Exquisita, a good plant, 6*l.*; maculata (semi-double), 4*l.* 4*s.*; vesta, 3*l.*; other lots from 10*s.* to 20*s.* per lot. Cape Heaths, with the exception of a handsome E. Cavendishi, for which 4*l.* was paid, fetched from 10*s.* to 1*l.* 1*s.* per plant. From the above it will be seen that the highest prices by far were realised for the Orchids, and that the stove and greenhouse plants went comparatively cheap. Should the remainder of the sale to-day produce anything of importance it will be given next week.

Calendar of Operations.

(For the ensuing week.)

PLANT DEPARTMENT.

Conservatory, &c.—Last week's directions as to the housing or protecting of tender plants should be attended to at once; for although such things as Camellias, Acacias, Cytisus, &c., may be exposed to a few degrees of frost, and, if not over potted, to heavy falls of rain without much danger of their being injured, there is considerable risk in having plants exposed too late in autumn, and this should be avoided if possible: but such things as Heaths, Chorozemas, and, indeed, the majority of our best greenhouse plants, cannot with any safety be left fully exposed to the chances of the weather after this season; and where proper accommodation cannot be found for these in the houses, some efficient shelter from heavy rains and frost ought to be provided at once. Where valuable stove plants have to be kept in the conservatory while in bloom, these will require careful management to prevent their being injured by damp, and they must not be overwatered at the root, as stove plants are soon injured in a low temperature if kept too wet at the root. Give air freely on bright days, but if the house contains many stove plants it will be advisable to shut up rather early in the afternoon, so as to retain a little warmth for the night; and in the event of wet cloudy weather setting in, it will probably be found necessary to use a little fire-heat, to dispel damp and preserve the blossoms of tender things, and this should be seen to before handsome specimens get disfigured or ruined for the season; for these in bloom are not over plentiful about most places at this season of the year, and are therefore worth caring for. Keep everything in this house as clean and neat as possible, removing decaying flowers and leaves, &c., immediately they are perceived, and examine pot specimens frequently, particularly such as may not occupy the most suitable places, turning them partly round in order to expose all their sides equally to light and air.

FORCING DEPARTMENT.

Pineries.—A rather dry state of the soil about the roots and also of the atmosphere is essential during the ripening of the fruit where high flavour is the object, therefore be careful not to over-water plants on which the fruit is approaching maturity, and it will be advisable to use slight fires on dull days, so as to allow of giving sufficient air to prevent a stagnant state of the atmosphere, for fruit of prime quality cannot be expected from plants growing in sodden soil or a damp unhealthy atmosphere. Endeavour to afford growing stock a steady bottom-heat of about 85°, and keep it well supplied with manure-water at the root, but avoid getting the soil too wet. As fire-heat will now be necessary to a considerably larger extent than has been the case during the summer, care must be exercised to secure a properly moist state of the atmosphere, keeping the evaporating pans or troughs regularly supplied with water, and moistening the floors &c. frequently, as any sudden change from a moist to a dry state of the atmosphere would be most injurious to growing stock, and also to plants swelling their fruit. Be as sparing of fire-heat, however, as circumstances will allow, and shut up early on the afternoons of bright days, so as to husband the sun's influences as much as possible. Where young stock is grown in dung-pits care must be exercised after this season not to get the plants weakly through keeping too close and warm, giving air freely on every favourable opportunity, and sufficient command of warmth should be secured from the linings to allow of giving a little air at night and on cloudy days. Vineries.—Use gentle fires when the weather is damp in houses where the fruit is ripe; but only just sufficient to keep the atmosphere dry, and look over the bunches, frequently removing any tainted berries immediately they can be perceived, for these if left in the bunches communicate the malady to others, and cause it to spread much faster than would otherwise be the case. It is still a too common practice to expose the Vines to the weather immediately the fruit is cut, and some persons deem this practice essential to the ripening of the wood. When the weather happens to be warm and dry, such treatment may answer very well, but to expose Vines in wet, cloudy weather, when the object is the ripening of the wood, is sure to result in disappointment; therefore, where the wood is not properly ripened, keep the atmosphere dry and moderately warm, and use sufficient fire-heat to allow of giving air freely both day and night. Use brisk fires in houses where the fruit is not yet ripe, giving air freely, and be careful to guard the foliage from insects, particularly where the fruit has to be kept for any length of time after it is ripe. Peaches.—As the trees will now be freely exposed to the air day and night, very little attention will be required here for the present. The foliage should, however, be kept clear of red spider, by an occasional washing with the engine where necessary, so as to preserve it in health until it has performed its functions and decays naturally. If any trees have to be removed from the open wall to here, this may be done immediately the present crop of fruit is gathered, as the removal if very carefully effected and the tree properly attended to afterwards will not prevent the wood ripening, and there will be plenty of time for the trees to make fresh roots and get sufficiently established to carry a crop of fruit next season if not forced too early.

FLOWER GARDEN AND SHRUBBERIES.

If previous directions have been attended to, the propagation of next season's "bedding stock" will by this time be well advanced, and where, from the pressure of other work or other causes, this is not the case, every possible dispatch must be used while the weather is favourable for such work. Where cuttings of Verbenas and such like things have yet to be put in they should be inserted rather thinly in deep pans or shallow pots, in which they can be wintered, as they will be got established sooner in this way than would be the case if they were to be potted off before winter, and we have frequently found late cuttings managed in this way to winter fully as well as stronger plants; and, except plants intended to furnish cuttings in spring, it is very immaterial how small bedding plants are before winter, provided they are well rooted without having been got up in a close warm atmosphere to render them sappy and tender. Many parties, through anxiety to secure large plants, keep bedding out stock close and moist until late in autumn, and frequently in frames on dung beds, where size is soon obtained, but plants treated in this way are necessarily so soft and tender that it is almost impossible to carry them over the winter without serious loss. Therefore avoid keeping such things too warm after this season, and if they are placed in bottom heat give air freely at night, and whenever it can be done without the cuttings flagging, so as to prevent weakly growth.

HARDY FRUIT AND KITCHEN GARDEN.

Where wasps are troublesome means must be taken to preserve ripe fruit from their depredations, and Plums and Apricots had better be netted up, as wasps, if at all numerous, soon do serious damage to these. Also look frequently over any varieties of Pears ripening, and gather those that are fit, for if allowed to hang after they are ripe the wasps are sure to find them, and will attack the fruit before it is fit for gathering, so that the crop will probably be spoiled unless it can be netted up. Where Currants are covered with mats, which, by the bye, are very inferior to close nets for this purpose, and much more expensive, the trees should be uncovered occasionally on fine dry days, so as to expose the fruits thoroughly to the air, in order to prevent their being injured by damp, &c. Trim and dress Strawberry plantations, and be careful to injure the leaves of the plants as little as possible, and avoid deep digging between the rows which is of no farther use than to injure the roots, as the Strawberry rather prefers a somewhat firm soil.

STATE OF THE WEATHER AT CHISWICK, NEAR LONDON,
For the week ending Sept. 20, 1855, as observed at the Horticultural Garden.

Satur. 29	64.5	44.9	54.7	18	0.46	1	3	3	2	5	10	2	3

The highest temperature during the above period occurred on the 28th, 1852—therm. 82 deg.; and the lowest on the 27th, 1828—therm. 24 deg.

Notices to Correspondents.

Astragalus: *Minna.* Nothing can be more variable than the form of the pod in this genus, or the manner in which it splits. The accompanying figure represents that of a species gathered at Eupatoria by Captain George Elliot, R.M., in which the valves are separating by their dorsal (or carinal) suture, quite through the spurious septum which is peculiar to this genus.

Books: *S B.* Mackintosh's work is excellent, but too much for a beginner. You had better commence with Loudon's Encyclopædia of Gardening, an old edition of which may often be picked up at second-hand book shops for a few shillings. Abercrombie's Gardening is also a good old book for a young man to work by.—*J Brown.* The third edition of the Vegetable Kingdom was published in 1853, and contains very numerous additions.

Names of Fruits: *J J P.* The Pear which accompanied the diseased Marie Louise appears on comparison to be exactly like the Easter Beurré, notwithstanding its coming to perfection so early. As far as our experience goes, the time of maturity of this variety extends over a wide range. *M. J. B.*

Names of Plants: We have been so often obliged to reluctantly decline naming heaps of dried or other plants, that we venture to request our correspondents to recollect that we never have or could have undertaken an unlimited duty of this kind. Young gardeners, to whom these remarks more especially apply, should bear in mind that, before applying to us for assistance, they should exhaust their other means of gaining information. We cannot save them the trouble of examining and thinking for themselves; nor would it be desirable if we could. All we can do is to *help* them—and that most willingly. It is now requested that, in future, not more than four plants may be sent us at one time.—*Creeper.* Smilax sarsaparilla, *L.* It wants more summer heat than we can give it, in order to produce its flowers.—*J B K L.* Jaborosa longiflora. *D Bowman.* Is it not a proliferous monster of Plantago lanceolata?—*W S.* Humea elegans.—*Mus.* Apparently a morsel of Quercus Phellos. We are unable to recognise the other plant by your description. —*G W.* The other is Hydrangea japonica, a plant hardy in any good climate, but best treated as a greenhouse plant in winter.—*Cranmer.* Your fungus is Uredo Rubigo vera, the red rust of Wheat. *M. J. B.*—*Q.* 1, Scutellaria splendens; 2, indeterminable.—*W T S.* Grewia asiatica.

Peach Tree: *D A.* Red spider has attacked it because the roots are kept dry. It has not touched the Vines because their roots are in the open border. There is no doubt about it.

Temperature: *T W.* The hottest day this year was the 6th of June, when the maximum temperature was 86°.‡

Vinegar Plant: *A K.* This is the spawn of a fungus called Penicillium glaucum. It thrives in a weak solution of sugar, which it soon turns to vinegar. You may cut the plant to pieces as often as you like. Every piece will grow.‡

*** As usual, many communications have been received too late and others are unavoidably detained till the necessary inquiries can be made. We must also beg the indulgence of those numerous correspondents, the insertion of whose interesting contributions is still delayed.

THE FOLLOWING MANURES are manufactured at Mr. LAWES' Factory, Deptford Creek:—Turnip Manure, 7*l.* per ton; Superphosphate of Lime, 7*l.*; Sulphuric Acid and Coprolites, &c.

Office, 69, King William Street, City, London.

N.B. Genuine Peruvian Guano, guaranteed to contain 16 per cent. of ammonia. Nitrate of Soda, Sulphate of Ammonia, and other Chemical Manures.

THE LONDON MANURE COMPANY'S NITRO-PHOSPHATE OR WHEAT MANURE FOR AUTUMN SOWING.—This Manure, composed of blood, animal matter, and dissolved bones with silicates, is most strongly recommended to the notice of Agriculturists. It contains from 7 to 8 per cent. of nitrogen, in a form yielding ammonia by slow decomposition, and is therefore particularly adapted for Wheat. The quantity required is 2 to 3 cwt. per acre drilled in with the seed. Price, per ton, 7*l.* 10*s.* in London.

PERUVIAN GUANO, FISHERY SALT, and every other MANURE on best terms, strictly warranted.

40, Bridge Street, Blackfriars. E. PURSER, Sec.

ARTIFICIAL MANURES, &c.—Manufacturers and others engaged in making ARTIFICIAL MANURES may obtain every necessary instruction for their economical and efficient preparation, by applying to J. C. NESBIT, F.G.S., &c., Principal of the Agricultural and Chemical College, Kennington, London. Analyses of Soils, Guanos, Superphosphates of Lime, Coprolites, &c., and Assays of Gold, Silver, and other Minerals, are executed with accuracy and dispatch. Gentlemen desirous of receiving instructions in Chemical Analyses and Assaying, will find ample facility and accommodation at the College.

BLOOD MANURE FOR WHEAT.

THE PATENT NITRO-PHOSPHATE OR BLOOD MANURE COMPANY.

TRUSTEES.

ABEL SMITH, Jun., Esq., M. P., 2, Halkin Street, West.
CHARLES DIMSDALE, Esq., Essendon Place, Herts.
EDWARD BALL, Esq., M.P., 8, Belgrave Road, Pimlico.
MAJOR-GEN. HALL, M.P., Weston Colville, Linton, Cambridge.
JOHN BEADY, Esq., M.P., Warwick Terrace, Belgrave Square.

DIRECTORS.

Chairman.—JONAS WEBB, Esq., Babraham, Cambridgeshire.
Deputy-Chairman.—JOHN SHARP, Esq., Tower Villa, Queen's Road, Regent's Park.
EDWARD BELL, Esq., Tottenham, Middlesex.
JOHN CLAYDEN, Esq., Littlebury, Essex.
RICHARD HUNT, Esq., Stanstead Abbot, Herts.
THOMAS KNIGHT, Esq., Edmonton, Middlesex.
ROBERT LEEDS, Esq., West Lexham, Norfolk.
ROBERT MORGAN, Esq., 72, Camden Villas, Camden Town.
THOMAS NASH, Esq., Great Chesterford, Essex.
JAMES ODAMS, Esq., Bishop Stortford, Herts.
JOHN COLLINS, Esq., Middleton Square, Pentonville.
(*With power to add to their number*).

Bankers.—MESSRS. BARNETT, HOARE, & Co., Lombard Street.
Auditor.—JAMES CAIRD, Esq., Baldoon, and 6, Sergeant's Inn, Fleet Street, London.
Secretary and Chemist.—JAMES TAYLOR, Esq., F.C.S.
Solicitors.—MESSRS. KINGSFORD & DORMAN, 23, Essex St., Strand.

MANUFACTORY, PLAISTOW MARSHES, ESSEX.

The Directors of the above Company (many of whom are eminent agriculturists), beg to call the attention of their friends and the agricultural community to their Patent Blood Manure, which is composed of Bones dissolved with sulphuric acid, to which is added about 1500 lbs. of pure Blood to every ton of the Manure, carefully dried and prepared for the drill or hand sowing. Being rich in Nitrogen and other necessary ingredients, it is especially adapted for the Wheat Crop, and has been used with the greatest success in all parts of England.

It is a very remarkable fact that the analysis of Blood and the grain of Wheat are nearly identical, as proved by the most eminent chemists; it contains all the elements which plants require, and when properly prepared and applied, will become the essence of vegetable as well as of animal life.

The highly fertilising properties of Blood has been commented upon by Professor WAY, and others, and the success of the Blood Manure for Wheat Crops has been fully proved upon all soils, by the practical experience of numerous agriculturists, a few of whom are the following:—

Sir Archibald M'Donald, of Woolmer Lodge, Liphook, says: "The Wheat manure I purchased of you has answered its purpose admirably."

Jonas Webb, Esq., Babraham, Cambridgeshire.—"Your Wheat manure I tried by the side of guano, and if anything it had the advantage, as the quality from it is superior."

Mr. Baker, Steward to His Grace the Duke of Bedford, Park Farm, Woburn, Bedfordshire.—"I used your manure upon a piece of poor land after Peas, and have grown an excellent crop of Wheat."

Mr. Benjamin Goulton, Gedney Marsh, Long Sutton, Lincolnshire.—"I drilled your manure at the rate of 2½ cwt. per acre, along with the Wheat over 30 acres, and although the field is the poorest land I have on my farm, the crop ranked amongst the best I have. I do not know how I can recommend it better than by saying I shall use it much more extensively this season."

Mr. Walter Murton, East Stour, Ashford, Kent.—"I sowed your Wheat manure last autumn, and the consequent increase in the crop both of corn and straw has convinced me of its great utility."

Mr. H. Steed, Nonington, near Wingham, Kent.—"I used Odams' Patent Manure for Wheat last November, and never have I used any artificial manure with such benefit."

Mr. Frederick Robinson, Southery, near Downham Market, Suffolk.—"I last autumn used 2 cwt. of your manure per acre on a piece of fen land; it came up very strong in plant, assumed a most healthy appearance during the winter, and has produced me one of the finest crops I ever grew."

Extract from the *Agricultural Gazette*, 7th April, 1855.—"The Nitro-Phosphate Company throw blood and bones together, and add sulphuric acid, thereby manufacturing a manure, which, as it contains soluble phosphate along with nitrogenous matter, is as nearly perfect, whether for roots or corn, as anything can ordinarily be."

Extract from the *Mark Lane Express*, of January, 1854.—"Amongst the new things which appeared this year for the first time was Odams' Patent Blood Manure; and it is this addition to our fertilisers which falls to our province to review. Blood has long been acknowledged one of the most enriching of all our manures, a proposition the soundness of which has been proved by innumerable experiments. Now that the startling fact has reached the ears of the agricultural public that Peru will be exhausted of Guano in a few years, surely the prospects of an everlasting supply at home will be accepted with some degree of national satisfaction, more especially since the latter is superior to the former in quality."

The Public are cautioned against spurious imitations; as security to the purchaser every Bag is marked "ODAMS' PATENT BLOOD MANURE," and sold only by the authorised Agents of the Company.

OFFICES, 109, FENCHURCH STREET.

Price 7*l.* 10*s.* per ton, free at any Railway or Wharf in London.

DIRECTIONS FOR USE.—From 2 to 4 cwt. per acre, according to the condition of the soil. It may either be drilled in with the seed or sown broadcast; if the latter it should be well harrowed in.

LIQUID MANURE.

PATENT LIQUID-MANURE DISTRIBUTOR OR WATER-CART, for the Distribution of Guano, &c., warranted not to clog up or otherwise get out of order. It has Waterproof Joints, and will scatter its Liquid from 12 to 15 feet wide. It will work equally well on hilly or on level land without any alteration. It is thoroughly adapted for Drill Crops or Pasture Land, or for Watering Streets.—Full particulars may be obtained of the Patentee, ISAAC JAMES, Tivoli, Cheltenham.

WARNER'S 4½-inch IMPROVED LIQUID MANURE PUMP, with Ball Valve, fitted with 1¼ inch Brass Union for attaching flexible suction, with strong wrought iron Straps for screwing on to any ordinary Water-butt or Cart, as shown in drawing.

Price of Pump and Union, 50*s.*

1½-inch Flexible Rubber and Canvas Suction for ditto, 3*s.* 6*d.* per foot.

1½ Gutta Percha Suction, 1*s.* 6*d.* per foot.

WARNER'S IMPROVED LIQUID MANURE, OR GENERAL PORTABLE PUMP.

The valve is a ball of imperishable material, and cannot clog in action. The barrel is of galvanised iron, not likely to corrode, and can be raised or lowered at pleasure. The legs will fold together, and the whole may be carried on shoulder to any pond or tank required.

Price of 4½ in. Pump, with legs, 3*l.* 3*s.* The barrel is 27½ in. long, and the legs are 5 ft. high.

1½ inch Gutta Percha Suction Pipe, 1*s.* 6*d.* per foot.

1½ inch Flexible Rubber and Canvas Suction Pipe, 3*s.* 6*d.* per foot.

May be obtained of any Ironmonger or Plumber in town or country, at the above prices, or of the Patentees and Manufacturers, JOHN WARNER & SONS, 8, Crescent, Jewin Street, London.

Every description of Machinery for Raising Water, by means of Wheels, Rams, Deep Well Pumps, &c.; also Fire and Garden Engines, &c.—Engravings sent on application.

WARNER'S PATENT VIBRATING STANDARD PUMPS.

PATENT CAST-IRON PUMPS, for the use of Farms, Cottages, Manure Tanks, and Wells of a depth not exceeding 30 feet.

Diameter of Barrel	Length of Barrel, under nose.		£	s.	d.
2½ in.	short 1 ft. 7 in.	Fitted for lead, gutta percha, or cast iron flanged pipe, as required.	1	12	0
2½ „	long 3 „ 3 „		1	15	0
3 „	ditto 3 „ 6 „		2	12	0
3½ „	ditto 3 „ 6 „		2	18	0
4 „	ditto 3 „ 6 „		3	5	0
2½ „	short, with 15 feet of Lead Pipe attached, and Bolts and Nuts ready for fixing		2	12	0
2½ in.	long ditto	ditto ditto	2	15	0

The short barrel Pump is very convenient for fixing in situations of limited height and space, for the supply of coppers and sinks in Wash-houses with soft water from underground tanks, or in Hot, Forcing, and Plant Houses; they may be fixed, when desired, under the stage.

May be obtained of any Ironmonger or Plumber in Town or Country, at the above prices, or of the Patentees and Manufacturers, JOHN WARNER AND SONS, 8, Crescent, Jewin Street, London.

Every description of Machinery for Raising Water, by means of Wheels, Rams, Deep Well Pumps, &c.; also Fire and Garden Engines, &c. &c.—Engravings sent on application.

ROYAL AGRICULTURAL SOCIETY OF ENGLAND.
MEETING AT CARLISLE, JULY, 1855.
FIRST PRIZE AWARDED TO

RICHMOND AND CHANDLER'S No. 3 B CHAFF MACHINE, Price £7.

All the various modern Implements of Agriculture manufactured on the most scientific and improved principles, suitable for home use and exportation.—Address, RICHMOND & CHANDLER, Salford, Manchester; and 32, South John Street, Liverpool.

☞ CATALOGUES GRATIS.

CAUTION.

PARKES' STEEL DIGGING FORKS AND DRAINING TOOLS.

Whereas very inferior descriptions of Steel Digging Forks are now manufactured and sold, and I have been informed that purchasers of the same have believed them to be the same as those manufactured by me, and to which the Royal Agricultural Society and numerous Agricultural Societies' prizes have been awarded, I hereby respectfully inform the public that every Fork manufactured by me is stamped with my trade mark "J. P.," and that Messrs. BURGESS & KEY, of No. 103, Newgate Street, London, are my sole Wholesale Agents, and I have authorised them to replace to the purchaser every Fork of my manufacture found defective; they will also on application send Wholesale and Retail Price Lists, &c., post free. FRANCIS PARKES & Co.

FIRST PRIZE REAPING MACHINE.
NOTICE.

MESSRS. BURGESS AND KEY beg respectfully to inform the public, and particularly the noblemen and gentlemen whose orders they were obliged to decline for this season on account of the manufacture not being fully arranged, that the Royal Agricultural Society's First Prize of 30*l.* was awarded to them for M'Cormick's Reaper, with their patent screw platform, at the trial at Leigh Court, near Bristol, upon the 29th of August last. Amongst the competing machines were Bell's, by Crosskill; Forbush's, exhibited by Mr. Palmer; and Hussey's, with tilting platform, by Wm. Dray & Co. The reports of farmers who have worked the machines during this present harvest, show that the average quantity of Wheat, Barley, and Oats which they cut was from 1¼ to 1½ acre per hour. Two horses work the machine with ease, and the only attendant required is a man or a boy to drive. Further particulars and prices sent free on application.—BURGESS & KEY, 103, Newgate Street; and 52, Little Britain, London.

COLLEGE OF AGRICULTURE AND CHEMISTRY, AND OF PRACTICAL and GENERAL SCIENCE, 37 and Lower Kennington Lane, Kennington, near London.

Principal—J. C. NESBIT, F.G.S., F.C.S., &c.

The system of studies pursued in the College comprises every branch requisite to prepare youth for the pursuits of Agriculture, Engineering, Mining, Manufactures, and the Arts; for the Naval and Military Services, and for the Universities.

Analyses and Assays of every description are promptly and accurately executed at the College. The terms and other particulars may be had on application to the Principal.

DRAINAGE OF LAND.

MR. HUMBERT, of Watford, Herts, a practical Surveyor and Land-Agent of more than 15 years' standing, offers his services to Gentlemen about to drain Land and Bogs. He will undertake to set out and superintend himself the execution of the work at a charge of 5*s.* per acre, and the expenses incurred in his travelling; or he will contract to complete it in a specified manner to the satisfaction of the Inclosure Commissioners at a fixed price per acre. Mr. Humbert has drained strong stony land in the most careful and complete manner, with 1¾ inch pipes, and proper mains, the drains being 4 feet deep and 30 feet apart, at 4*l.* per acre and under, and he can give reference to his employers in that and in other instances.

Watford, Herts, Sept. 22

SMITHFIELD CLUB, 1855.—FAT CATTLE SHOW.—The ANNUAL CHRISTMAS SHOW of FAT CATTLE, SHEEP, and PIGS, will take place on the 11th, 12th, 13th, and 14th of December, 1855, at the Carriage Bazaar, King Street, Portman Square, when nearly 800*l.* will be awarded in Prizes and Medals.

The printed forms of Certificates, properly filled up, must be returned to the Honorary Secretary on or before SATURDAY, November 10th. Prize Sheets and the necessary printed forms of Certificates are now ready, and can be obtained on application to B. T. BRANDRETH GIBBS, Honorary Secretary, Corner of Half-moon Street, Piccadilly, London.

All communications on the Club's business should bear the words "Smithfield Club" on the outside.

The Agricultural Gazette.

SATURDAY, SEPTEMBER 22, 1855.

THE COMPOSITION OF THE SUPERPHOSPHATE OF LIME in the market ranks in importance as an agricultural subject next to that of guano. There is hardly a testimonial published by any manure company to the merits of their particular form of this manure that does not end with an order for 5, 8, or 10 tons of it, and a very large proportion of all the Swedish Turnips grown in the country are indebted to it for their growth. The soluble form of phosphate of lime seems especially adapted to hasten the growth of the young Turnip plant through the period when it is most liable to injury by the fly, and the heavy crops grown after the application of 3 cwt. per acre of good "superphosphate" to a good Turnip soil, prove the manure to be equally efficient till the very close of growth. No wonder, then, that all our manure companies and manufacturers profess to make superphosphate of lime—or that one company, of whose respectability the names of its trustees, directors, and auditors are sufficient guarantee, seems by its title to devote itself exclusively to the production of this important fertilizer. This company styles itself, indeed, the "Superphosphate *Compost* Manure" Company; but then superphosphate is always given in the form of a compost: the biphosphate of lime is to be obtained alone only by a nice chemical process. In its manufacture from bones or coprolites it remains in the midst of the other ingredients which beside phosphate of lime those substances contain, and in the midst also of those other matters which the materials added may have formed. All superphosphate agriculturally is superphosphate "compost;" but everybody understands that the real value of any manure to which the term applies depends essentially upon the quantity of phosphorus in a soluble form which it contains.

Now, manures to which this term applies, vary in a very remarkable degree in this their characteristic feature. Superphosphates vary in

the quantity of phosphorus they contain much more than guanos do in the quantity of their ammonia. The former are artificial, and depend for their composition on the skill as well as the intention of the manufacturer, and in what these result may be gathered from analyses before us by Messrs. Way, Anderson, Nesbit, and others. These gentlemen have had samples of "superphosphate" under their examination which contained 21 per cent. of superphosphate, and samples of superphosphate which contained no superphosphate at all! The article by Dr. Anderson published a fortnight ago in our columns tells us what may reasonably be expected in a manure claiming this name, and the assertion with which it concludes, that many tons are sold containing but ½ a cwt. in the ton of what they are called, ought to be enough to put farmers on their guard. Our columns have before this shown instances in which either fraud or the grossest carelessness in manufacture has sent out superphosphates worth but 50*s.* a ton, the market value of the name being 7*l.* 5*s.* In July, three years ago, we called attention to a case of this kind, and we now republish the letter of Professor Way on which that exposure hinged:—

"The sample of superphosphate of lime is, as you supposed, a very inferior article, and I am afraid from its composition that its inferiority cannot be mercifully imputed to the mere ignorance of the maker. A good superphosphate should contain 12 or 15 per cent. if not more of soluble phosphate—the sample in question does not contain 1 per cent. Moreover the total proportion of phosphate of lime is so much smaller than it should be that I cannot help believing that some of the gypsum was put in as such—not produced by the ordinary action of sulphuric acid. In fact, I believe that it is a mechanical mixture of ground bones and gypsum, but I cannot assert this positively. Anyhow it is a bad sample of superphosphate. I should not value it at more than 2*l.* or 2*l.* 10*s.* per ton, because it can only be worth the bone it contains. Its analysis gave,

	Per cent.
Moisture	16.09
Organic matter and ammoniacal salts	14.56
Sand, &c.	11.30
Biphosphate of lime (equal to neutral phosphate rendered soluble 0.61)	0.41
Neutral phosphate of lime, insoluble	13.00
Hydrated sulphate of lime (gypsum)	37.27
Alkaline salts, with some carbonate of lime	7.37
	100.00

Nitrogen 1.51 per cent., equal to ammonia 1.83 per cent."

Instances of a nearly similar kind to this are now before us, to which a correspondent has called our attention, where superphosphate compost has proved on analyses by Professor Way to contain but 2.86 and 3 per cent. respectively of soluble phosphate of lime. We do not know that our correspondent charges fraud on the manufacturer from whom this substance was obtained, but the result of carelessness is just as bad as that of fraud—and a manure containing 2¼ cwt. of water, 2 cwt. of sand, 8½ cwt. of gypsum, and 2 cwt. of "chiefly common salt," with only 2 cwt. of bone earth, and less than 70 lbs. of superphosphate in each ton is none the less a source of loss to the purchaser, whether it be ignorance or fraud that overlooked its manufacture. It is worth rather less than 50*s.*, but probably 150*s.* was paid for the ton of it, and 3 cwt. only having therefore been applied per acre, the Turnip crop is lost, and the loss of that affects the productiveness of a whole rotation of crops.

It may be sufficient for the present that we have called attention to the fact that very worthless stuff is sold as superphosphate; no quantity of this manure should be purchased without the guarantee of an analysis. It needs but little skill in manufacture to ensure the value of the substance, and the failures instanced are the less excusable. In the little pamphlet recording his experience, which our correspondent has distributed in his county, analyses of superphosphates purchased from Mr. W. J. Carne, of Markham, from the London Manure Company, and from Mr. Lawes are given, and the quantity of soluble phosphate of lime in these varied from 15 to 28 per cent. Mr. Lawes guarantees 16 per cent., and is manufacturing from apatite a superphosphate in which he will guarantee the existence of 30 to 35 per cent. of soluble phosphate. These facts will become known, and those whose intelligence, good faith, and skill result in composts of the composition quoted above, will infallibly and happily lose their custom.

By the novel and admirable arrangement of the ropes in Fisken's Steam-plough, which we have before described, a wonderfully simple and light form of anchor is rendered sufficient. It consists of a cast-iron plate 8 inches wide and a yard-and-a-half long; and this being laid edgeways in a crease cut in the ground, presents a powerful resistance to a sidelong strain; while it can be easily drawn forward endways *in* the soil. By means of a stake set down upon the headland, and a rope connecting it with a small windlass on the anchor, one boy can shift the latter forward as fast as required. A beam of wood attached at right angles to the iron blade prevents it from tipping over or rising out of the ground; and an upright iron standard carries the pulley in a nearly horizontal position.

The arrangement of the ropes we need not stay to describe: merely observing that the endless hemp-cord traverses up and down along one headland as well as across the field in the direction of the ploughing, so that by an adaptation of the travelling-crane principle, the pulleys can be shifted without involving any alteration in the length of the cord. To fit different-sized plots of ground, the cord can be cut and spliced again in a few minutes.

Let us now proceed to the economical qualities of the invention. By means of the apparatus already described a steam-engine set in one corner of a field causes a barrel to revolve upon a continuously-travelling carriage; and *had any efficient digging-cylinder been invented*, it could have been actuated just as well as this barrel, but in the absence of such a tool, Mr. Fisken has employed the barrel to drag behind it a series of ploughs, by winding along a fixed rope. The carriage, with two ploughs attached (as exhibited at Carlisle), weighs 15 cwt.; and it was set in motion by 400 yards of driving rope; yet it worked one plough at a pace of about two miles per hour, when the engine had a pressure of only 7 lbs. per square inch—and this engine was of 7-horse power at 45 lbs. pressure. From the condition of the land at the time we saw it, we should say that one horse would have easily ploughed as large a furrow at the same pace; but *the trial perfectly proved how small a per-centage of power is lost in the transmitting tackle.* Concerning this essential point, however, we are able to adduce the testimony of a high authority, namely James Stirling, Esq., C. E., of Edinburgh.

In April, 1852 (for the steam-plough has been hatching for some years), this gentleman was instructed by a Special Committee of the Highland and Agricultural Society of Scotland to report upon the invention; and, having seen his report, we give the following details.

The inventors, Messrs. W. D. and F. Fisken, first put their plough in operation upon the farm of Gellyburn, in Strathearn (six miles from Auchterarder, Perthshire), occupied by one of the brothers. For the sake of a motive-power for experimenting, they dammed a small brook passing the farmstead and falling into the river Earn, and set up a water-wheel. This was an overshot, 10 feet diameter, and 3 feet in breadth, having an average speed of 10 revolutions per minute; and by means of a spur-wheel, pinion, and large rigger, communicated to the driving-rope a velocity of 745 feet per minute.

The travelling windlass or plough carriage was differently constructed from the present one, having two drums alternately coiling and uncoiling two ropes: the ploughs also were made of wood, and the workmanship of the entire apparatus had much the appearance of a pocket-knife manufacture about it. The principle, however, was just the same as in the present machine; only instead of the speed of the driving-rope to that of the plough-carriage being as 11 to 1, it was as 7 to 1—the ploughs moving 108 feet per minute. By carefully measuring the quantity of water passing to the wheel, and making all requisite allowances, Mr. Stirling found that the effective power of the wheel did not exceed 2 horse-power; and this propelled one plough at the rate of about 1¼ mile per hour—ploughing a furrow 9 inches wide and 7 inches deep in "ground of a moderate stiffness." The carriage itself weighed 12 cwt.; there were upwards of 500 yards of driving-rope in motion; and the greatest distance of the plough from the wheel was 250 yards. Mr. Stirling states his opinion that a calculated mechanical horse-power being greater than that of an ordinary animal, the difference between the nominal and actual horse-power will be sufficient to make up the loss from the friction and inertia of the transmitting apparatus—in other words, that *a 2-horse engine will do with this machine the work of two real horses.* An economy of power equal to this has never been approached by any other steam-plough; and to show that it is both satisfactory and profitable, we invite consideration to a few figures.

It will not do to calculate a horse's power from the draught he may be pulling when walking at a smart pace. Take the draught of a 2-horse plough at 36 stones, and the pace of the horses 2¼ miles per hour; and you find that each horse is doing duty equivalent to 54,000 lbs. raised 1 foot high per minute, which is equal not only to 1 but to 1.636 mechanical horse-power. But the fair way is to say that, ploughing 9-inch furrows, the team accomplishes 1 acre in eight hours; the *average* pace being not 2¼, but 1.375 mile per hour; and each horse pulling 18 stones, does duty equal to 30,492 lbs. lifted 1 foot per minute, which is considerably under the usual estimate of a mechanical horse-power (namely, 33,000 lbs. raised 1 foot per minute).

A steam horse, could it work without any loss of power in the connecting machinery, would draw a plough, therefore, at an average pace not only of 1.375, but 1.480 mile per hour, doing 1.11 instead of only 1 acre in eight hours. Then, as it can work ten hours a day instead of eight, it will do one-quarter more than this quantity, or 1.387 acre per day. The speed of the roughly made implement in the above trial was 1¼ mile per hour—rather slower than the average pace of a team, but still equal to 1.138 acre in ten hours; and, as no time is lost in resting and breathing the horses, and very little lost in shifting at the ends of the work, the 2-horse power water-wheel may be estimated to plough as nearly as possible 1 acre per day. Messrs. Roger, of Stockton-on-Tees, have manufactured a neater machine; and with some slight alterations in the adjustment of the ploughs (and, it may be, a small wire rope in place of the hemp cord, and a pitch-chain instead of the wire drag-rope), we do not see why the Messrs. Fisken may not *plough any land where two horses are the common team, and turnwrest work no objection, for 4s. or 5s. per acre.*

The inventors, Messrs. Fisken, of Stamfordham, by Newcastle-on-Tyne, have made considerable sacrifices in a study foreign to their profession, in order to bring this invention before the public; and as the machinery is inexpensive, and so easily applied that a common portable steam-engine can work it without any alteration or addition, merely by attaching a rigger to the fly-wheel, we hope that some landowner or occupier will now be found to give the new steam plough a thorough trial upon his farm. *I. A. C.*

THE ROYAL AGRICULTURAL SOCIETY'S TRIALS OF REAPING MACHINES.

In the *Mark Lane Express* of this week I observe an article from the *North British Agriculturist* upon the trials of reaping machines, in which it is attempted to be shown that the tests of reapers generally, and at the last trial in particular, at Leigh Court Farm, were not sufficiently comprehensive and practical, so as to realise the object of such trials, viz., that the decisions of the judges may so thoroughly be relied upon, that agriculturists run no risk in acting upon their judgments by purchasing reaping machines according to their conclusions.

Now, though it would be easy to show that the Royal Agricultural Society have rendered an immense benefit to the agriculturists of Great Britain by causing a great number of valuable new implements to be brought into general use which would either not have been invented, or if so merely been used locally, had it not been for the existence of the Society, the proof of this assertion I leave in abler hands, nor shall I attempt on paper to prove that the judgment passed upon the reaping machines at the late trial on the farm of W. Miles, Esq., M.P., was according to evidence, or whether the evidence was complete; but I intend to try to prove in the field, that as far as my machine is concerned, the judges did not make an error in awarding me the 20*l.* prize; to those who think otherwise I beg to say that I hope that they will not decide upon the assertions of the *North British Agriculturist*, but will see the machine at work.

The first trial will take place to-morrow, the next on Tuesday, on a farm in the parish of Melsonby, Darlington, and another trial or two will be announced by advertisement.

Justice to myself as an exhibitor at Leigh Court farm, and an earnest desire to see the long debated question of reaping by machinery settled, are the best excuses I have to offer for occupying your columns. *John Palmer, Stockton-on-Tees, Sept.* 18.

METHODS for COLLECTING AGRICULTURAL STATISTICS.

[Evidence given before the Lords' Committee by Mr. Hall Maxwell and Mr. Caird.]

J. Hall Maxwell, Esq., *examined.*—Will you explain to the Committee the mode which you adopted to obtain the returns, and what success you met with?—The mode adopted then was very much the mode which was followed in 1854, and is now in course of operation; for example, taking the county of Roxburgh, we divided it into certain districts for our purpose, grouping the parishes with a view to their agricultural features, so as to have, as far as possible, a district similar in its agricultural products, and in the character of its farming. We selected and secured the services of an influential, intelligent, active practical farmer in each district, as the enumerator, and we gave him a committee to aid and to work under him, consisting of farmers of a similar stamp, connected with the different parishes, so that in fact each parish in the district was represented at the committee. I prepared a form of schedule, of which I hold a copy in my hand; in some respects it has since been altered, and in one important point in particular we have since deviated from the plan of 1853. The necessary number of schedules were then sent by me to the enumerators of districts, by whom they were circulated amongst the occupants of land; they were returned to him, examined, and sent by him to me, and then I tabulated and booked them. Now, we found that that system did not work well; I found, particularly in the pastoral districts, that there was a decided disinclination to pass the filled up schedule, containing answers to the queries, through the hands of any neighbour, however respectable or well liked he might be.

I held a meeting on this point; among other places, at Hawick, when there was a sort of compromise effected; the farmers agreeing to support the inquiry provided they were allowed to direct their answers to myself; they seemed to prefer that I should receive and look at them rather than any neighbour. I have described the staff; I shall now describe the schedule. The occupant was asked to state, first, the total number of acres on his farm, then the total number of these arable, and the manner in which the farm was subdivided; that is, the acreage of every crop, of fallow, Grass, sheep-walk, waste, roads, fences, &c. A return of wood was taken exclusively from the proprietor. The schedule also contained columns of stock. I have already stated that the tillage farmer was required merely to state, as a basis for after inquiry into his produce, that which was patent to any one, the acreage of his crops; but as acreage affords no criterion, in pastoral districts, of the stock maintained on it, the stock farmer had to return directly the number of head possessed by him. The Committee will observe, with reference to stock, that when I got the answers to the schedule, the work was done. I had merely to add the individual returns in each district, and to put the results of different districts together, in order to show the stock of a county; but I had another process to go through in order to arrive at the yield of the crops: though I had received from every occupant a return of his acreage, and of how that acreage was subdivided into Wheat, Barley, Oats, &c., such a return did not tell me how many bushels per acre he had raised. It was deliberately considered, and it was very early resolved, that it would be most impolitic and inexpedient, with a view to success, to ask the farmer any direct question as to his produce. We believed that, as a voluntary measure, it would not succeed if he were so asked; and that there was less risk of deception by resorting to some indirect method, such as we did adopt. The method was this: the enumerator of a district and his committee, the committee being a jury for the district, and the enumerator, you might say, being the chancellor of that jury, received written instructions from me in the course of the summer to keep their ears and their eyes open, to observe how the crops were looking, to inspect their respective parishes, and to ascertain their neighbours' opinions as to the prospects of the harvest; and by such a course of inquiry, commenced before and continued after harvest, while the crop was growing, when it was cut, after it had been stacked, and up to the time of some of it being threshed or weighed, each man in his own parish was directed to form an estimate of the probable average yield per acre of each grain and root crop. The enumerator then summoned his committee or his jury together; they compared notes for the different parishes, struck an average for the district, and reported to me that for their district, in their opinion, the average yield amounted to so many bushels of Wheat per acre, so many bushels of Barley, Oats, &c., and so many tons of Potatoes, Turnips, &c. I issued the schedules on the 1st of May; there were two reports that year, one of acreage and stock, and the other the estimate of the crops; the first report was dated 25th of July. The supplementary report or estimate of produce was not published by the Board of Trade, but by their permission by the Society on our own responsibility; it was dated 19th November; so that it took from the 1st of May to the 19th of November to complete the inquiry.—Will you state what alterations you introduced in 1854, and what alterations you think might with advantage be introduced in the collection of the statistics? In 1854, at a conference with the Board of Trade in relation to the Industrial Museum, which has since been established in Scotland, the Duke of Hamilton, the Duke of Buccleugh, and other members of the Highland Society, availed themselves of the opportunity to urge the prosecution of the statistical inquiry, and I was required by Mr. Cardwell to estimate the cost of putting the same measure into operation over the whole of Scotland, which had been tried experimentally in three counties; the sum estimated was 6000*l.*, which was granted. I may mention, that the same system generally was followed in 1854 as in 1853. There were only two alterations of any moment to which I think I need allude: the first I have already explained, namely, that the schedules were issued directly by me, and returned to me. The other alteration was, that in 1853 we served schedules upon all occupiers holding as small a portion as 2 acres, so far as my memory serves me; but in 1854 we made rent, and not extent, the line of demarcation: we still believed it to be absurd to send schedules to every little occupant of land, who could neither comprehend the schedule, nor fill it up; but we thought rental was a better limitation than acreage: a man might hold 2 acres, and pay a comparatively large rent, much larger than one in the Highlands holding 20 acres, and paying a few shillings; we therefore adopted the money limitation to fix the point at which schedules should be issued. We found it necessary again to draw a distinction between the Highland and the Lowland districts; we believed we might safely send schedules to all persons in the Lowlands paying a rent of 10*l.* and upwards; but we were told that it would generally be fruitless to seek direct information from Highland tenants paying less than 20*l.*, so that it was resolved to take direct information, by the service of schedules, from all tenants in 26 Lowland counties rented at 10*l.* and upwards, and in the seven Highland counties at 20*l.* and upwards. With regard to those below these marks, it was further resolved that I should devise some means or other of getting, through indirect channels, information to lay before Goverment, in order to exhaust the margin down to the lowest possible figure. This supplemental report is now ready to be lodged with the Board of Trade. The issue of the schedules by me, and the mode of treating the small holders, are, therefore, the two principal changes in 1854 as compared with 1853.

JAMES CAIRD, Esq., *examined.*—You are aware of the mode which has been pursued in England by the Poor-law Commissioners, through the agency of their officers, in attempting to obtain information during the past year?—I am so, in so far as their report gives me that information. Is it your opinion, that that is the best means of obtaining such information, or can you suggest to the Committee any other mode which in your opinion would be better calculated to obtain the desired results?—I do not think it the best mode of obtaining that information; I myself suggested to Mr. Cardwell, about two years ago, a mode which I subsequently read before the Society of Arts, and which, if your lordships will permit me, I will again go through. The main object is to obtain trustworthy returns, and those with the least necessary expense. Trustworthy returns can only be obtained through trustworthy officers, responsible for the correct performance of their duty, and working under a system which affords a ready test of accuracy. Economy will be promoted by employing a small number of competent and responsible men, rather than a very numerous body of local officials, each of whom must receive a fee, while they would be comparatively irresponsible, and, from their numbers, subject to no satisfactory test of accuracy. The first point to be ascertained is the acreage under each different crop, and this is by far the most important part of the inquiry. This will not be an estimate, but a record of facts. It is requisite, therefore, that it be conducted with care and deliberation, and, as it may be begun as soon as the seed is sown, the three months of May, June, and July may be occupied in this part of the inquiry. There could be no reasonable objection on the part of any occupier to an inquiry as to the manner in which the surface of his farm is cropped. That is quite a different question from demanding to know the total produce of his crops. It may be proper, therefore, to make answers to this inquiry compulsory, if necessary, which necessity, it is believed, would very rarely arise; nor would there be the same objection on the part of the farmers to answer such questions when put by a responsible and confidential officer, as by what might be thought a prying and irresponsible neighbour. The acreage under each different crop having been ascertained, the occupier would be required to say not what was the actual produce of a particular field, but what was the average produce per acre of each crop on his farm in ordinary years. Before harvest these important facts would thus have been ascertained, viz., first, the extent under each kind of crop; secondly, the average produce per acre of ordinary years. Taking the foregoing data as the principles on which to conduct the inquiry, the following would be the plan of operations,—(I do not say that this is the only plan, or anything like it, but it is one which I have considered). I will suppose a branch of the Tithe and Inclosure Commission Office, or such other office as the Government may deem most suitable, to be the central office for issuing instructions, comptrolling officers, inspecting and testing the accuracy of the returns, and for arranging them for publication. One, two, and in some cases, three collectors of returns for each county, according to its extent, would be appointed. These would be selected as men of known competence; each collector would be employed, on an average, 90 days before harvest in ascertaining the acreage under each crop, and other particulars; and 10 days after harvest in ascertaining the comparative yield of the last crop. The collector, provided with his map and list of occupiers, would, between the 1st of May and the end of July, personally visit every occupier of land within his district, and mark down in a book the several particulars required to be ascertained. This book would, when completed after harvest, be forwarded to the central office in London, and would be preserved for the purpose of being afterwards tested by the personal inquiry of a superior officer. Immediately after harvest the collector would again visit each parish in his district, and satisfy himself as to whether the crop of each kind was an average, or how far it was above or below an average. Having already calculated the average produce of each crop in a parish, he would alter that to correspond with the actual produce of the particular season. Thus, for example, if he had ascertained that a certain parish had 1500 acres in Wheat, which at the rate of the average of years yielded 39,000 bushels, but that the actual yield of that year had proved 2 bushels an acre below the average, he would subtract 3000 bushels from the above quantity, and return 36,000 bushels as the estimated yield of Wheat in that parish. The main part of the calculations having been completed before harvest, the alterations necessary after harvest would be made with great facility, and the gross returns of the crops be ready for publication by the 10th of October. Monthly reports of the state of the growing crops at the most critical period would be made during the three months of inquiry. It would be part of the duty of the central office to test the returns of every collector, by an inspector taking his returns for a particular parish, and investigating on the spot each statement recorded. This should be done in spring, so that the estimate might be compared with the fact after the crop was threshed out, and thus any carelessness or gross inaccuracy would be detected and a useful guide be supplied for the future. Incompetency or carelessness would be visited with loss of employment. After the gross returns of produce were issued (which would be the first object), it would be the duty of the central office to compile from the returns such valuable statistics as had a special bearing on the agricultural improvement of the kingdom, and of every separate district in it. I think the mode which was adopted in Scotland of sending returns direct to the Secretary of the Highland Society, and having local committees to fix the averages, was an extremely good one in theory, but there was no opportunity of checking the correctness of the returns, which were sent direct to Edinburgh. It appears to me that there is a machinery in Scotland at the present moment, upon which this inquiry might be with advantage engrafted. I have here a copy of a schedule which has been issued under the Land Valuation Act of Scotland, which has just come into force, and under which the occupiers and proprietors are, under a penalty, bound to return the nature of the subject they occupy, the parish in which it is situated, the estimated extent; the grain rent, the kind of grain if a grain rent, the amount of conversion in converting it into money; the drainage interest, if any is paid by the tenant; and it would be easy to add three or four columns, embracing the returns with reference to each crop; this is required under an Act of Parliament; and there have been in every county in Scotland valuators appointed who would be very useful men for obtaining this information.

J. H. MAXWELL, ESQ., *further examined.*—With regard to the opinion which Mr. Caird has expressed, that there is a want of means of testing the accuracy of the returns as now made, can you suggest to the committee any mode by which an efficient test may be furnished, if you think none at present exists? Mr. Caird, to a certain extent, is right; but, to a certain extent, he is wrong as to the want of any test of accuracy under the scheme which was devised and worked out by me. There is to a certain extent, a test of accuracy; I described on Tuesday how incidentally I had here and there a valuable test of accuracy, by the investigations of certain members of the committee who conceived it was their duty to collect the acreage of their parishes, and the identity between their reports and the aggregate of the individual returns from such parishes. It may be said that this was accidental, but if the result of the accident be valuable as a test, I could easily do the same thing here and there again. If it was one year done here, and another year there, and if the result was such as to satisfy Government of the *bona fides* of the farmer, and that their returns of acreage were substantially correct, it would to a certain extent, serve as that test of accuracy which Mr. Caird thinks is wanting. There was another test of accuracy; in some instances the enumerator of a district required me, to enable him to estimate the crops, to send him, not what the acreage of this man was, or that man, for I would not have done that—those were confidential statements to me—but what the general acreage of the crops over a district or in a parish was. In such cases any glaring error necessarily attracted his attention, or that of the member of committee for that parish. Many trivial errors were discovered, which led to a great deal of correspondence on my part, with a view to trace and put them right; but the character of the errors was such as to satisfy the enumerators and myself, that there had been no intention to deceive. That was another check. Mr. Caird was asked by a noble lord, whether his views as to the want of accuracy in the Scotch returns were based upon the fact of inaccuracy, or only upon an opinion that there might be inaccuracy. Mr. Caird stated, that in his own district there were some slight inaccuracies; of course they must have been very slight, because he being my enumerator in that district, they were not communicated to me, and I have not heard of them till the present moment. There is another test, which, as a farmer, Mr. Caird must admit exists; those schedules show the rotation of a farm, and every person who knows anything about farming, and gets accustomed to reading the schedules, will see at once where there is a material misstatement. If there should be 150 acres of Barley in the return, and there are only 15 or 50, it will speak for itself, and lead to correspondence in order to trace the error: this was the case repeatedly last year. It may be asked, moreover, what is the object which a farmer has to deceive in making his return of acreage. In preparing an estimate, the parties may have an interest in falsifying the estimate but I put great faith in the honesty of the farmers in Scotland; some of them may refuse to give information, but I have the most perfect confidence in their honesty and *bona fides* when they do give it; and as it was only the acreage which was asked from them, a fact any one could ascertain, and as the individual returns of acreage were not to be published, but only the acreage of a large district of parishes, if the farmer put as much confidence in my honesty as I did in his, he had no object in deliberately misstating his acreage, and I do not believe it was done. So much for the test of accuracy; but I will go a little further, and say, if there is no test of accuracy in the scheme which has been worked out in Scotland, I want to know where it is in that which Mr. Caird would substitute for it. I did not exactly gather whether Mr. Caird meant to apply the machinery to Scotland that he spoke of in the first part of his evidence as to England, for, there, there is no test of accuracy. If the general scheme which he proposed for England, particularly in reference to the estimates of produce, were to be proposed for Scotland, I would object to it on the ground, *inter alia*, that there is no test of accuracy. It appears to me to be a fallacious scheme; he starts on an assumed basis which does not exist, and that contains no test of accuracy whatever. The basis of Mr. Caird's scheme for estimating produce is the average yield of ordinary years for each farm: I am perfectly confident of this, whatever means may exist for establishing this basis in England, there are no such means in Scotland. In Scotland if they would give it you they could not, they have not the means. It may be that after statistics have been in operation for some years, and the attention of farmers has been directed to the subject of averages, they might be able to give it, but in the mean time they could not individually give you that which is the foundation of Mr. Caird's scheme, an accurate average of each crop for the last five years. I will prove that in this way: I thought it was exceedingly desirable last year to be able to give some indication how far the result of the harvest of 1854 might be above or below an average; I did not attempt to get each farmer to say what was his average produce over a series of ordinary years, that would at once have been going into the inquisition which Mr. Caird would like to avoid; but I said to the enumerators and committees, try and find out for me generally, in a rough way, how far the crop of 1854 is above or below the crop of an ordinary year. Even in that general way, in a considerable number of districts in Scotland the enumerator and his committee, although men appointed to the office on account of their skill and professional knowledge, were unable to give me any such report. And I may mention that in one of the two districts of Wigtonshire, Mr. Caird's own county, I failed in obtaining such information. Further, as I understand it, the rest of Mr. Caird's scheme, he proposes, having got this ordinary average, to determine how far the average of the current year is above or below the ordinary one, by applying to it the mean of the weather. I understand he takes the average of ordinary years, and according to what the weather has been, he determines how far this year is above or below that ordinary average. Mr. CAIRD.—I may be allowed to say, perhaps, that I only take the weather as a very important element. Mr. MAXWELL.—The weather is an important element, but it is a very difficult element to judge of. We have no meteorological observations in Scotland, and we have no means of establishing what the weather has been, and, besides that, the mean weather may have been very excellent, but an unfortunate thunder shower at a critical time may have done a very great deal of harm. I look upon Mr. Caird's own superior intelligence and knowledge of these matters as having rather run away with him upon this subject, and that he expects farmers in general to be able to do all he can do himself. My general objection to Mr. Caird's scheme is that it is an estimate upon an estimate; his acreage is a fact I admit, but he has an estimate upon an estimate in this way: he has to estimate the average produce of ordinary years; that average must be necessarily an estimate, and then there is an estimate of the weather to be brought to bear upon the first, in order to get at the produce for the year. So that he gets at the produce of the year by means of two estimates, both of which, I think, would be apt to be fallacious.

JAMES CAIRD, ESQ., *further examined.*—Having heard the evidence of the last witness, have you any wish to explain any portion of your former evidence? Yes; with regard to Scotland, I think the objection Mr. Maxwell takes that the schedule I suggest would be regarded as a tax-paper, does not in the least degree hold, inasmuch as it is a tax-paper for county rates, and the rates in Scotland are almost entirely paid by the landlords. The farmers or occupiers have scarcely any interest in those valuation returns, and would make no objection to them. I think that is a sufficient answer to Mr. Maxwell's objection that my proposal of employing the county valuators would connect the statistic returns with taxation. With regard to the impossibility which Mr. Maxwell says there is in ascertaining the averages, and the instances which he has adduced from Scotland, in which his inquiry on this point was not answered, I beg to state that the distinction is very obvious. If you ask a man, as he did, to tell you the average produce of a hundred different farms in half-a-dozen different parishes, he may very probably say, I cannot tell you what it is, but if you ask him to tell you the average for his own farm, he will have no difficulty whatever in doing so. I never found any difficulty of that kind in my inquiries in England. Mr. Maxwell seems to think that farmers do not know that, even in their own case; but I beg to ask how a man could hire land at all, if he did not ascertain its quality by its relative produce to other land. It is because 1 acre yields so many bushels more than another that it brings a higher rent. The first point a man would inform himself on would be, "What is the average produce of this land naturally?" He would be ignorant of his business if he did not know what the average produce was of the farm which he held. In reference to the objection which Mr. Maxwell took, that the plan I proposed would occupy so many months, that could be obviated at once by employing more collectors; if 200 collectors do it in three months, a certain proportion more would do it in two months; you do not alter the total amount of the expenses, but only the number of the people who are for a proportionally shorter time employed. His objection to leaving schedules for a lengthened period does not hold in my case, as I do not propose to have any schedules. Mr. Maxwell seemed to say that there was some test at present in Scotland, and that I ought to know that, from having acted on his staff in my own county. I may say that I felt it my duty (being in the county when he visited it for the purpose of explaining the matter to the farmers) to do everything in my power to assist the Government in this inquiry. Having gone to the meeting which Mr. Maxwell has referred to, I acted as chairman, and assisted him in explaining and enforcing his views; and the gentlemen then present insisted that I should myself act, which I consented to do with great pleasure. But I told Mr. Maxwell then, and still maintain, that he has no test of accuracy. The whole of the returns were sent direct to Edinburgh; they were never sent back to us, and we never had any means of testing their accuracy. Mr. Maxwell seems to misapprehend my plan, when he describes it as an estimate upon an estimate. It is an estimate on a fact; an estimate of produce on an ascertained acreage, which is all that can be got by any plan whatever. I wish to say that I do not in the least degree desire to appear in antagonism to Mr. Maxwell: on the contrary, I think he deserves very great credit for the spirit in which his system, such as it was, has been carried out in Scotland.

ON FATTENING POULTRY.

(*Continued from p.* 620.)

CHAPTER I.—THE PRINCIPLES OF FEEDING.

SECTION II.—*Examination of the Substances used in Fattening Poultry.*

Supposing the principles above-stated be correct—and both theory and practice tend to prove their perfect truthfulness—it is obvious that the value of any substance used as a food for fattening animals can only be ascertained by a reference to the relative quantity of warmth-giving, flesh-forming, and fat-forming materials it contains; and such an examination will give us a true index of its money value, and enable us to ascertain how far the practice of feeders has been based upon right principles.

OATS AND OATMEAL.—Oats or oatmeal are perhaps more largely employed than any other grain in fattening poultry; and in this case the experience of feeders strikingly corresponds with the results afforded by scientific examination. Oatmeal contains, in every 100 lbs., 6 lbs. of fat or oil, 18 lbs. of flesh-forming,

and 63 lbs. of starchy materials; Oats contain the same quantity of fat in every 100 lbs.; but in consequence of the large proportion of husk, the quantity of flesh-forming and starchy substances is lessened to 15 lbs. of the former and 47 lbs. of the latter; thus Oats are not as valuable for fattening purposes as oatmeal—especially as, from the presence of the husk, and their undivided state, they are not so rapidly digested.

Wheat and Bran, Middlings, &c.—Wheat, in its entire state, contains only one-half the fatty materials of Oats, and hence it is not usually employed in fattening; the fat of Wheat resides almost entirely in the outer portions, which, when removed, constitute bran, pollard, and middlings—the latter, or finest bran, has been remarked by Prof. J. Johnston as being almost similar in its composition to oatmeal, being much richer in both fat and flesh-forming foods than the inner parts of the grain. Its value in fattening pigs has been long known; and the writer can speak from long experience that it is equally efficacious in fattening poultry. It contains 6 lbs. of fat, 18 lbs. of flesh-forming, and about 53 lbs. of warmth-giving food in every 100 lbs.

Barley and Barley-Meal.—Barley is not advantageous as a fattening food, as its per centage of fat is very low, being not more than 2 lbs. in every 100 lbs.

Indian Corn.—Indian Corn is remarkable for the large quantity of oil contained in yellow varieties—nearly 8 lbs. in every 100 lbs. Its capability of supplying flesh is not so great as that of oatmeal, hence it is not well adapted for laying hens, which it renders too fat; but this peculiarity fits it remarkably for fattening poultry, for which purpose it is largely employed in the United States.

Rice.—Rice is one of the least advantageous foods either for fattening or supplying flesh; it contains only a trace of fatty materials, and less than half the quantity of flesh-forming food contained in Oats.

Peas and Beans.—All the varieties of Pulse contain a much larger proportion of flesh-forming or nitrogenous substances than any grain—in fact, about 25 per cent., or double the quantity contained in Wheat; whilst the proportion of fat is not more than 2 in the 100. This composition admirably fits them for the support of the animals undergoing much muscular exertion; given to fattening animals, they are apt to harden the fibre, as in the well known case of Bean-fed bacon; and the elaborate experiments of Mr. Lawes in pig and sheep-feeding prove most distinctly that the increase in weight of a fatting animal is dependent on the carbonaceous, and not on the nitrogenous constituents of its food.

Milk.—Milk is a most advantageous addition to the food of poultry, as it contains 3 lbs. of fat (butter), and nearly 5 lbs. of warmth-giving (sugar of milk), and 4 lbs. of flesh-forming food (curd), in every 100 lbs. Skimmed milk, or butter milk, from having had the fat removed, are by no means so advantageous.

Animal Fat.—If any pure fat is given to fatting fowls, it is evident, from what has been previously stated, that it should be of as solid a character as possible, for as it is assimilated without much change it is evident that the firm character of the fatted poultry is much increased by it. The evil effect of Linseed-cake upon geese has already been alluded to, arising from the liquid condition of the oil contained in it; the best addition to the food of poultry consists, therefore, of the hardest and cheapest variety of common fat, namely, mutton suet, or what is equally good, the paring of the loins, which are at present sold to the tallow melter.

Cooking Food.—One other circumstance remains to be considered in this section, namely the alteration effected in food by cooking. The influence of heat is chiefly exerted, in the case of vegetable foods, on the starch which constitutes so large a portion of all grain: this in its natural state consists of small granules, which are (as in the well-known case of Arrowroot, a very pure variety of starch), insoluble in cold water, from the circumstance that each is coated with a firm membrane; when heated to a degree somewhat short of boiling water, this membrane cracks, and the interior gummy portion of each granule dissolves in the water and thickens it. There is no doubt but that starch, thus altered, is more readily and rapidly digested than in its insoluble state; hence the advantage of cooked food for fattening pigs, and the desirability of employing boiling water to scald the meal used in fattening poultry.

It may perhaps lead to easier understanding of the relative value of the different kinds of food, if their constituents are stated in a tabular form, it being borne in mind that such statements are merely approximations to the truth, as the composition of grain varies with the character of the season and the soil.

Table showing the composition of the substances employed in fattening poultry.

Every 100 lbs. of	Fat or Oil.	Flesh-forming Food.	Warmth-giving Food.	Mineral Substances.	Husk or Fibre.	Water.
Oats contains	6	15	47	2	20	9½
Oatmeal	6	18	63	2	2	9
Wheat	3	12	70	2	1	12
Middlings (fine bran)	6	18	53	5	4	14
Barley	2	11	60	2	14	11

(*To be continued.*)

LOIS-WEEDON.

A spirited essay of the Lois-Weedon practice was made last year by Robert Calwell, Esq., of Belvedere, in the county of Down, to the extent of 14 acres, all the operations having been performed in the most careful manner (a still more extensive one, amounting to 29 acres, is carrying on this year). The balance sheet of this experiment has been laid before a meeting of the Chemico-Agricultural Society of Belfast, and is as follows:—

Cost of 14 a. 0 r. 36 p. of drilled Wheat.

	£	s.	d.
4½ cwt. of Wheat sown, finished 19th Nov. 1853 ...	£3	2s.	3d.
Marking out, 16s.; drilling, 1l. 7s. 6d.	2	5	6
Rolling, 6s.; covering with rakes, 8s.	0	14	0
Digging, one spade deep (a spade deep is probably a foot), 14s. per half acre	9	19	2
Forking, 10s. per acre, 31st March, 1854	7	0	0
Forking and weeding between drills of Wheat ...	6	15	6
Horse-hoeing between drills, 6th May	0	5	2
Scarifying the fallowed intervals, 10th June ...	1	16	0
Breaking clods, 8th May	0	10	6
Hand-weeding and wheeling off weeds	14	12	7
All cost previous to reaping	46	18	8
Scarifying the fallowed intervals after stooks were removed, 2d till 14th October	3	16	0
Forking and taking off stones and weeds from fallowed intervals, to have all clean and fine for drilling	7	13	0
Interest on cost of implements	1	12	0
All cost one year	59	19	8

Leaving ground well prepared for drilling.

Produce bad, only 5 tons 17 cwt. on 14 acres; Wheat bad quality, heads 1 inch longer than same Wheat broadcast on Potato ground, stooked as thick on ground as broadcast, but being worked too late among, roots were loosened, half of heads consequently did not fill; the pickles of those that did fill well were very large. Crops left 1l. 2s. for rent per acre, straw left for harvesting and threshing expenses.

Mr. Calwell thus ascribes the defective crop to the late working of the soil and consequent loosening of the roots. It is very possible in this he is correct. It is probable from the sum charged for forking, 10s. an acre, which, after the digging, ought to have been a light and inexpensive operation, that the forking was deep, which for a spring operation I should think wrong; it may also have been, and very likely was, carried too near the plants: the cost of the operation would also indicate this. He was also too late in sowing.

Let us now compare with Mr. Calwell's essay Mr. Smith's first year's experiment on his four-acre field. He says, under date of November, 1850—"I entered upon the field last month (October); I then simply ploughed the field an inch deeper than it had ever been ploughed before; cleaned and levelled it; and so, without further preparation, got in my Wheat. I have just sent in my spadesmen to trench the fallow intervals two shallow spits deep for the succeeding crop, and, without any misgivings, await the result. November, 1851.—I am now enabled to give the result of my experiment on the four-acre field of Wheat, on which I entered in October, 1850:—

	£	s.	d.
Paid for ploughing (6s., the half portion of each of the 4 acres)	£1	4	0
Harrowing, levelling, and cleaning the foul stubble (10s. do.)...	2	0	0
Pressing the channels for the seed (1s.)	0	4	0
Dropping the seed in the channels by hand (5s.) ...	1	0	0
Four pecks and one gallon of seed (5s. per bushel)...	0	5	7½
Rolling (6d.)	0	2	0
Hoeing between the rows (3s.), scarifying the intervals (3s.), bird keeping (4s.)...	2	0	0
Reaping (9s.), carrying to barn and unloading (6s.)	3	0	0
Threshing and winnowing 20½ qrs. (at 2s. 11½d.) ...	3	0	2
Rates and taxes (4s. 8d.), and interest on 20l. for outlay, implements, &c.	1	18	8
Total outlay	14	14	6
20½ quarters of clean Wheat (exclusive of tails) ...	35	17	6
8 tons of straw (40s.)	16	0	0
	£57	17	6

It is here seen that Mr. Smith very correctly makes no charge against this crop for double digging or other operations having report to the succeeding crop, and Mr. Calwell should have followed this rule; he would then, notwithstanding the short-coming of the crop, have had a much heavier balance on the profit side, though still too light. As applicable to the general preparation and to the ensuing crop, we may deduct from the expenses of this crop the following items:—

	£	s.	d.
Marking out	£0	16	0
Digging one spade deep (this we are to suppose refers to the intervals, which is then a preparation or fallowing for the ensuing crop)	9	19	2
Forking at 10s. per acre (this appears to have been applied to the intervals, as the next article does to the rows)	7	0	0
Hand-weeding and wheeling off weeds, as already a charge of 6l. 15s. 6d. has been made for forking and weeding between the drills, and as much of this weeding must be to the benefit of future crops, there may fairly be deducted from this item	10	0	0
Scarifying the fallowed intervals after stooks were removed	3	16	0
Forking and taking off stones and weeds from fallowed intervals...	7	13	0
	39	4	2
Deduct from this the amount, which, according to Mr. Smith, was expended in ploughing, harrowing, levelling, and cleaning the foul stubble at 16s. per acre, and which is not charged by Mr. Calwell	11	4	0
	28	0	2

or 2l. an acre, which added to the 1l. 2s. 0d. which by Mr. Calwell's estimate he has for rent, would give him 3l. 2s. 0d. for rent, &c.

The correctness of this view may be questioned, as it may be said the existing crop has derived benefit from these workings of the intervals; but I have not made any deductions from the more superficial operations in them, to which alone we can with certainty attribute beneficial results to the growing crop: any benefit from the deep working and bringing up of crude material to the surface to the growing crop is very problematical—indeed, I think it cannot admit of question that the throwing on the surface of this crude material is injurious to the growing crop, although highly productive of future fertility; and I am disposed to think that properly these expenses should not even be charged *in toto* to the succeeding crop, inasmuch as their beneficial effects are not exhausted by it, but a long future fertility is induced by them to the soil.

However valuable Mr. Smith's plan may be as proving the possibility of producing, without manure or much previous preparation, a crop of Wheat on exhausted land in England, I do not consider it in the same degree applicable to Ireland. We all know both from the slovenly tillage of Ireland, the moisture of the climate, and the mildness of the winters, that the soil here is far more redolent of weeds than it is in England. We have evidence of this, if it were wanted, in these two accounts before us; for, while Mr. Smith has only expended 10s. an acre in harrowing and cleaning his stubble, and has had to incur no future expense for weeding, Mr. Calwell has expended over 2l. an acre in works connected with weeding after the crop was in the ground, and we know not how much before. In instituting this plan, then, in Ireland, I think it would be advisable to commence with some ordinary fallow crop that would leave the land in its usual semi-clean state; or with a spring cereal crop, Wheat if you please.

It is rather curious that making these deductions from Mr. Calwell's account, and charging it with the harvesting and threshing, his costs come within a shilling of Mr. Smith's; for while Mr. Smith's is 3l. 13s. 10d. an acre, Mr. Calwell's is about 3l. 14s. 10d. *J. M. Goodiff.*

DEFINITION OF QUALITY IN WOOL.

The points to be treated, as respects the quality of wools, were thus defined by the Jurors of the Great Exhibition:—"The fineness and elasticity of the fibre; the degrees of imbrication of the scaled surface of the fibre as shown by the microscope; the quantity of fibre developed in a given space of the fleece; the comparative freedom of the fleece from extraneous matters; and the skill and care employed in preparatory processes, such, for example, as that termed 'scouring' the fleece, upon which depends its liability, or otherwise, to mat at the bottom of the staple."

The qualities most valuable in regard to the fleece are thus pointed out by a colonial correspondent of great experience and judgment:—1. Fineness. 2. Fullness. 3. Freeness. 4. Soundness. 5. Length. 6. Softness.

1. Fineness of the fibre of the wool can be judged of by practice when a lock of it is laid on the cuff of a coat of a dark colour. A deficiency in this quality will show itself by an abrupt falling off in fineness either in the neck or breech of the animal, or in both. The difference in fineness between these parts and the rest of the fleece should be so gradual as to be almost imperceptible. The "settler" cannot exert himself too much to breed "close up," as it is called (*i.e.* to make the whole fleece as nearly as possible equal throughout), otherwise the character of his flock as "good breed" will never be established, and the wool will invariably prove bad in the manufacture. No hair must be anywhere visible on the animal, especially under the forelegs.

2. Fulness means the closeness with which the staples or locks of wool grow together on the skin. Upon opening the wool of a sheep possessing this quality in perfection, only a thin line of skin, as fine as a pencil stroke, will appear round each staple, but if deficient, a space almost bare. This is a point in which the Australian Sheep are generally deficient, and of course the weight of the fleece suffers most materially. Some of the German sheep have great rolls or puckers of skin under their necks und other parts, which give them a singular appearance, but the extent of wool-bearing surface is thereby increased.

3. Freeness means that the separate staples or locks of wool, and also the separate fibres of each staple, are distinct, and by no means entangled together, or what is called "smushy," like cotton wool. A deficiency in this quality shows itself most plainly along the ridge of the back. In a well-bred sheep the wool, on being opened, should fall apart under the hands as clear and broken as the leaves of a book. A want of knowledge of this quality has caused infinite mischief in Australia, from people having mistaken an absence of freeness for fullness or closeness of growth, which we have already explained.

4. Soundness or strength of fibre is a quality in which New Zealand wool, like its native flax, is said to be pre-eminent. Along the ridge of the back there is a sort of division between the wool of each side. Tenderness, *i.e.*, deficiency in soundness, invariably shows itself there. Take out a staple from this part, and give it a strong steady pull, holding one end in each hand. If this proves sound, depend upon it that the whole fleece is so too. This is an indispensable quality in a combing wool, such as New Zealand is fitted to produce, as the process of combing tries the soundness especially. It is one also in which the Australian wool is liable to be deficient, arising from a check to the growth of the wool from the sheep having been half-starved by drought, an affliction to which those countries are so often liable. For though

the wool begins to grow again as soon as the sheep recovers his flesh, there is always a weak place in that year's clip at the point where the growth recommenced, by which it is materially damaged for combing purposes at least.

5. Length of fibre must be carefully regulated by the nature of the pasture and climate; for any, the least, excess will cause a proportionate deficiency in soundness, by which the wool will be depreciated for clothing, and rendered utterly useless for combing. If the length of the wool be too great for the nature of the country, it will be known by the twisting of the wool into hard bands, like pieces of twine, which break almost like rotten thread. It is an error as mischievous as the short cottony wool, and cannot be too carefully avoided. To judge of the length of the staple in a fleece, the best part to examine is the division along the ridge of the back, as it is there usually somewhat shorter than in other parts.

6. Softness sufficiently explains itself. A want of this quality is most conspicuous between the points of the shoulders and up the neck.

There is an oily matter natural to the wool of merino sheep, an excess or deficiency of which is equally objectionable, but there seems to be no definite term to express the different kinds of oil, yolk, or gum, as they are alternately called. Probably those sheep should be chosen whose fleeces abound in what may be termed transparent oil within the fleece, which, flowing to the end of the staple, there forms a yolk or gum, which by combining with dust, gives the surface of the wool a dark look. There can be no doubt that this yolk preserves the fleece from "dead ends," and the deleterious effects of stormy weather, that it greatly facilitates the growth of the wool, and much increases its strength, softness, and elasticity. Manufacturers, I believe, will be found to prefer a fleece well supplied with the yolk, after it has been thoroughly washed, to a dry fleece with "dead ends," as they acknowledge that the wool from oily sheep is manufactured with much less waste, is easier worked, and will make handsomer and more lasting cloth than the wool of sheep quite destitute of oil. But there is another kind of gummy matter, quite different in its appearance and effects from the above. This may be observed in yellow, thick, pitchy particles within the fleece, and does not circulate freely to the end of the wool, consequently the fleece has a light-coloured surface, with "dead ends," and as the wool cannot be freed from this thick adhesive gum by a common cold-water wash, such fleeces will show a larger per centage of shrinkage in cleansing than any others.

The German fleeces are much fuller of yolk than the spout-washed Australian wool; on this account a considerable allowance of weight must be made when comparing the weight of the former with that of the best conditioned flocks of Australia.

The weight of the fleece obtained from various kinds (both the maximum and the average), is a matter highly desirable to be known.

We have a great number of breeds in Great Britain, from the Shetland, yielding only about 1½ lbs. of fine cottony wool, and various short and long woolled sheep, ranging from 2 to 10 lbs. the fleece, but there are other breeds scattered over the globe, of the peculiar characteristics of which we know little.

It is impossible for a stranger to conceive the extreme care and attention paid to the production of fine wool in Germany, where immense flocks are reared for their wool alone, kept during the greater part of the year in large barns, and so carefully tended, that neither dew nor rain is allowed to fall upon them. In the King of Saxony's flock, wethers are kept to the age of nine or ten years, solely for the 2 lbs. of wool which they annually yield. If subjected to a varying temperature or checked perspiration, a knot is formed in the staple, which can be seen under a very strong magnifying power, and which very materially deteriorates from the value the Germans attach to the article. Next to equality, fineness of texture is the great desideratum, and a beautiful machine has been invented by Mr. Jeppe, of Rostock, for the admeasurement of the thickness of the wool, and the proof of its strength, which unites the accurate workmanship and delicacy of watchwork. By this instrument 100 hairs of each fleece, selected from nine different portions of the body, forming an average of fineness, are subjected to a given pressure, which is registered on a very minute index. The result of one experiment was, that an Austrian fleece had been produced, of which 12 hairs only equally in thickness one Leicester!

In the Museum at Stutgard are said to be samples of every wool in the known world, comprising those even of our most recently-established colonies, carefully washed, weighed, and sorted, with such descriptive remarks appended as are necessary to illustrate the subject.

So important is the proper selection of breeding animals considered in Germany, that the best flockmasters there do not trust to their own judgment, or that of their shepherds, but employ persons called "sheep classifiers," who make it their special business to attend to this part of the management of several flocks, and thus to preserve, or, if possible, to improve the best qualities of both parents in the lambs.

The ordinary flocks in Saxony produce very fine wool, but much less in quantity than those of the improved breed; the first yielding from 2 to 2¼ lbs., worth from 2*s.* 6*d.* to 3*s.* 6*d.* per lb., whilst the flocks of M. Gadegast, and a few others, yield from 2½ to 3¾ lbs., worth from 3*s.* 6*d.* to 4*s.* 4*d.* per lb. Thus whilst the yield of an ordinary sheep of the country would be worth on an average 6*s.* per annum, the yield of an improved sheep would be as much as 10*s.* a year. This large difference in the produce of each sheep in a flock of some thousands would of course amount to something well worth the extra care and expense.

There are flocks of the Negretti breed in Mecklenburgh and Pomerania of undoubted blood which average 4 lbs. per fleece, worth 3*s.* 6*d.* per lb., and many rams are to be found yielding from 8 to 10 lbs. of washed wool. This weight is also often reached in the Cape Colony and in America.

The Merino race ought as much as possible to be kept pure in France; and the flesh of the French breed of sheep would be improved for food by a cross with the English breed.

M. de Lavergne, a recent French writer, from careful inquiries, estimates the number of sheep in France and the United Kingdom severally at 35 millions, but while the English sheep are supported upon 77 million acres, those of France live upon 132 millions. Scotland, in spite of all her endeavours, can maintain only about 5,000,000 sheep, and Ireland, which from its pasture ought to rival England, reckons at most only 2,000,000, upon 200,000,000 acres.

Estimating the value of our flocks, we shall find:—

35,000,000 sheep at, say 25*s.* average, worth ...	£43,750,000
The fleece, at a low average of 4 lbs., say at 10*d.* the pound	5,833,333
	49,583,333

The average return of an English sheep farm is fully six times greater than a French one. *P. L. Simmonds, in the Journal of the Society of Arts.*

Home Correspondence.

Crops in Ireland.—Contrary to our expectations I am sorry to say that, from what has been threshed out, and from the handling of the sheaves, a great short-coming in the yield of our Oats is apprehended in this neighbourhood. The Potato crop still increases in promise, as the tubers are very large, indeed larger than ordinary, and as well tasted as previous to the disease—there could not be a finer crop of them; as yet they do not, I am speaking of the general crop, average more than four or five diseased ones in a stone weight, yet the disease is evidently progressing, and the early kinds, which have been reserved in the ground for seed, show many diseased tubers, perhaps as many as a fifth or sixth of them. The singular change in the appearance of the disease is everywhere observed, that of the stems not showing those blotches they have ever done before; the haulm of the earlier kinds, and in some instances of the later, wither and die away without an appearance of blotch, and, where this is the case many diseased ones are found. The stems of our late kinds, which is here confined to Scotch downs, are everywhere green, the leaves alone are withered, and we may, therefore, expect them still to improve in size and ripeness. It seems, too, that the bogs have suffered this year in some cases more than the uplands, and there are instances in which the clays are safer than the gravels. Altogether it seems a most whimsical disorder, and as fanciful as a fine lady, for it is never two years the same; it is quite a Will-o'-the-Wisp to our poor peasantry. When it first made its appearance, at least when it first struck so sensibly upon us as to be remarked, in 1845, the Potatoes were dug and housed before we knew anything of it, but they were no sooner so than destruction began and progressed with a rapidity that soon left little more sound ones than barely sufficed for the next year's seeding. In 1846 it so varied its time of attack that none but the early planted escaped an all but total destruction, and such as did were of course unripe and very small; they were also without flavour, indeed not eatable by any but those to whom a Potato in name and form was still a Potato. In 1847 the disease came on so late that the withering of the stems was taken for a ripening, and people flattered themselves that the enemy had retired from the field. In 1848 they were disappointed by its again early appearance, and so it has continued to play upon us with an alternate early and late attack every year, the years of odd numbers showing itself late, and the years of even numbers early. The Potato has, however, every year improved in its keeping quality, and, with ordinary care, the rot indoors in the winter has been very trifling. The attack, too, to ordinary observation appears lighter every year; but this, I rather fear, is more apparent than real, and is, I think, more owing to the discovery of new sorts that, from some mysterious cause, are able to resist the disease, or its effects at least, on the tuber, for the old kinds wherever grown seem still to suffer as much as ever while in a growing state, and the early Potatoes are very liable to it when left in the ground to the time of its attack, depending in some degree on localities. The White Rocks, which I do not know, and the Scotch downs, the crop of the country for a great distance round this, from a peculiar vitality, are able to maintain the greenness of their stems for a month or six weeks after their leaves are withered, and their tubers suffer certainly much less than any other kind, but they have a peculiar property of throwing off their tubers to a very great distance from the plant, the tuber underground string or stem being frequently a foot and a half long; I am disposed to think that much of the safety of the tuber may depend on this circumstance, as the antiseptic property of clay may intercept and absorb the vitiated juices on their so long passage to the tubers. As far as I have remarked the tubers of the close clustered kinds of Potatoes suffer more from disease than those of the kinds in which they are more spread out. I think the regular alternate early and late appearance of the disease deserves more notice than it has yet attained; if it does not tend to elucidate the subject, it might be of practical use both in regulating the period and manner of planting, and indicating the propriety of introducing a stolen crop, especially in the years of early attack; the plants in these years are so withered by the end of July as to leave such a crop in the full possession of the ground. I would suggest the planting of alternate rows of Potatoes and Drumhead Cabbage, and where, as in Ireland, the Potato is a main chance, and, more especially, where a Potato similar in habit to the Scotch down is grown, that the drill be planted with a double row of sets, as they are apt to send out their tubers in single drills into the spaces between them. I have found such double drills with other kinds of Potatoes very productive. Say then, take a double drill one foot asunder with an interval of 3 or 4 feet, in which plant a row of Cabbage. *J. M. Goodiff, Scrably County, Cavan.*

Smut in Wheat.—Our attention was first drawn to the cause of smut in Wheat, arising from thick sowing, three years ago. A neighbouring farmer permitted us to thin a rod of his Wheat by way of experiment, in the month of March, which was sown at 2½ bushels per acre. Three-fourths was taken out, but it did not answer the purpose for which we intended it, viz., it did not branch satisfactorily, as some have from similar proceedings when performed early in autumn. It did not tiller more than the rest, but was prominent for its dwarfness throughout the summer, and did not lodge as the other, nor hasten to ripen by a week or fortnight. It taught us one other important lesson, however, which we have not forgotten, and now desire to make known—that not one smutty ear could be detected in the whole group, whilst on the main breadth, at least 20 black ones might have been gathered at any part, without moving a foot. The variety was rough chaffed white, which appears more subject to smut than any other. *Hardy and Son, Seedgrowers, Maldon, Essex.*

Beans for Horses.—Oats with me are a very poor crop, and they are scarce in the district. Beans are plentiful with me. I wish to feed my horses on the latter, but there is considered to be a danger in using Beans till they are hardened in the stack—say till Christmas. Would boiling or steaming obviate this? And are boiled Beans for horses in hard work equal to bruised Beans. *S.* [Will any one who has had experience of Beans soaked in water previous to use as horse food give it to our correspondent?]

Thin Seeding.—No wonder that your correspondent at the Newmarket Union obtained 131 heads from 1 grain of Wheat, containing 5700 grains, by transplanting the spires. We believe it quite possible to obtain double or treble such a quantity by a similar proceeding, provided it was sown in the month of June instead of September, by repeating the transplanting process from the spires or offsets in a nursery bed during summer, and finally in October allowing ample space for all the plants. But this is only a weak argument in favour of thin seeding, as it cannot be practically followed up as advantageous to farmers. Our practice of thin seeding, we contend, may be practically and profitably carried out on a large scale with no inconvenience. Frequently have we obtained upwards of 80 ears, and from 4000 to 8000 fold from single grains and isolated plants, by giving them ample space to perform their natural capabilities without the trouble of propagating or transplanting the spires and offsets. How it is that your correspondent manages to make Wheat germinate at 5 years old we cannot understand, as we ourselves have failed to get any to germinate at all when it was 3 or 4 years old. *Hardy & Son.*

Miscellaneous.

Well made Hay.—I have always held the doctrine that for hay to be nourishing it must retain the sap. Just as a Radish for instance was only good when fresh gathered, but became dry and fibrous afterwards, so was it with hay, which when cut too late, instead of being sweet to the taste, became thick, woody, and fibrous, both less agreeable to the palates of cattle, and less nourishing to them. If hay was mown just before it was ripe, they would get less weight but more nourishment. If any person wished to sell hay merely, he might care more for the weight of it and less for the welfare of the cattle eating it, though even then he might be no real gainer, since parties buying his hay, when they found it inferior to other hay, would not give so much for it, so that he would not get so good a price in the end. It was better to make the hay good, and get a good name for it. As an analogous instance of the benefits of cutting hay when in a greenish state, I may mention that when the Tobacco growers wish that leaf to have a particularly fine flavour they put it together in a wet state and let it ferment. So it is with hay; if allowed to remain till it is dead before cutting it, it cannot sweat. There was a way in some parts of putting hay into what was called lap-cock. Before night the hay was taken up, and turned over into these lap-cocks, which were made up very light, something like a lady's muff, for the wind to blow through. The lap-cock system answered very well, and did a deal of good. In the Halifax neighbourhood they never let the hay alone from the time it was cut till it

was stacked; spreading it out, turning it before noon, and putting it into foot-cock before night. Then as to the weather they must make the best they could of it. I remember to have heard of an old farmer calling to consult Dr. Herschell, the astronomer, about the best time to cut his hay, when the doctor pointed out to him a field of hay spoiled by the wet, belonging to himself, as a proof he knew no more about it than any one else. To try to get any flavour from hay, or anything without sap, was like trying to milk a barren cow. There was another thing to be considered in making hay—namely, never to spread more out in the morning than could be got together again before night, as it would be exposed to injury from dews, which were as injurious as rain. If they were to squeeze the sap out of the green stalks of Grass they would find on evaporation a crystallisation of saccharine matter formed. Take for instance any crop of grain, such as Oats, and mow them, and let them remain till they were ripe; they would not find anything like the nutriment in the dead as in the wet green stalk. The same rule would hold good in respect to hay. *Mr. Briggs, Chairman of the Wakefield Farmers' Club.*

Calendar of Operations.

SEPTEMBER.

West Sussex: *Sept.* 20.—Since our last report we have been able to finish harvest, and in the very best order. We have never had an easier one to manage; any of the operations could be commenced in the morning and continued through the day without alteration: there was hardly a possibility of getting wrong. Now threshing has begun, and in our sight we see three steam engines at work threshing and winnowing from 90 to 110 sacks a day each, which ought to supply our market pretty well, and it is wanted, for Chichester market has not been so scantily supplied for many years as it was the last week or two. We hear various reports respecting the yield, but on the whole it appears to be better than was expected, and will, no doubt, bear out our assertion that it would be quite an average. Barley does not turn out so well, and the sample is inferior. Potatoes, though much diseased, can be called a good crop, for setting aside the bad, there is a heavy crop left, and we hear again of a sack per rod, which is said to be the produce in the good old times. They are selling, when dug, at 10*s.* per sack of 2 cwt. Swedes are a little affected with mildew, but generally are a good crop; the later sown Turnips are not so good, the weather has been too dry for them. The young Clover is strong in many places and may suffer during the winter frost, if not eat down a little before that time. Trifolium and Rye has been got in in good order, but will not be up until we get rain. If ever the autumn clearing of stubbles is to succeed it must this year, for our most stubborn clay falls to pieces in working. Grass has got rather short, but our dependence on it will soon get less. *G. S.*

Wester Ross, *September* 17.—Better harvest weather than we have this year been favoured with we have never had, and never can have; and a continuation of such weather for other ten days would enable the farmers in this neighbourhood to have the year's produce of grain snug in the stack-yard. On this farm harvest operations were commenced on the 24th ult. On that day little was done, as rain began to fall about breakfast-time, and it continued wet throughout the day. On the 25th cutting was resumed, and without any further interruption was completed on the 7th inst. As all our hands were occupied with cutting, binding, &c., there was none carted home until the 8th, and on the 14th the whole crop was in the stack-yard in good condition. In 12 days five scythemen cut down 80 Scotch acres, and on the 18th work-day from the commencement 55 stacks were found in the stack-yard. Scythemen had 3*s.*; binders, 2*s.* 3*d.*; and women 1*s.* 6*d.* per day, without victuals. The actual outlay, exclusive of work done by half-year servants, was 18*l.* 10*s.* It would be well to know the cost of cutting a similar number of acres with a cutting machine; there certainly is not room for much saving. The bulk of straw is under an average, and is greatly less than last year. Here there is not such a deficiency as is generally complained of, and yet we are short of last year's bulk by some eight stacks. We will not have a corresponding deficiency of grain however. The stacks bid fair to thresh well, and the grain filled and ripened so equally that we will scarcely have any dressings at all. Although the weather has been dry and wonderfully favourable for harvest work, the Turnips have suffered very little from drought. Ere the harvest commenced there was abundance of rain, and with dew at night they have made wonderful progress, and will be a full crop. There is a good demand for them to be eaten off with sheep at last year's prices, which were greatly higher than had been given for many years. We may now say that we have escaped the Potato disease for a year, and a more abundant crop, or Potatoes of finer quality could scarcely be desired. The disease did show itself in all our fields, but its progress was so slow, and its form so mitigated, that the stems are not yet wholly blackened, and the tubers, so far as I have seen, have escaped untouched.

Notices to Correspondents.

Bailiff: *A Subscriber.* A person really deserving the character you give him will be worth 100*l.* a year. Many claiming such a character may be had for from 30*l.* to 40*l.* and board and lodging, or 1*l.* to 1*l.* 5*s.* a week without.

Chalk: *Sub.* It may be applied on your clay land meadows before winter with good effect. Apply 50 yards an acre, broken down as much as possible, in November.

Horse Hoe: Busby's horse hoe *without* the barrow would be too heavy for "a pony of 13 hands, strong, and active;" or it would be quite within its power according to the stiffness and state of tilth of the land. In the case of a well managed crop we should think your horse would manage it.

Malt Mills: *S C.* It appears that the Inland Revenue Office have directed "That where brewers now have or use stones, steel mills, or any other contrivance than metal rollers, with plain or smooth surfaces for crushing their malt, they may be immediately required to remove such machinery from their premises, and discontinue the use of the same; and that when brewers receive their malt in a ground state, the officers endeavour to ascertain the construction of the mill used for the purpose; and, if they cannot obtain correct information on the subject samples of the ground malt be sent to the Board." This has, therefore, given an impulse to the manufacture of steel crushing mills. Any agricultural machine-maker will supply them. We perceive by the *Liverpool Mercury* that a high character was given at the agricultural show at St. Helen's, Lancashire, the other day, to those manufactured by Messrs. Richmond & Co., Salford.

Marquis of Tweeddale's Implements: *A Landed Proprietor.* If you apply to Messrs. Scoular, of Haddington, they will doubtless supply you, or tell you where to apply for them.

Tiney's Success: *Correspondents.* General Arbuthnot has not enabled the publication of his address, and of course we cannot give it. If he is disposed to part with seed he will doubtless advertise it.

WARNER'S SWING WATER-BARROW
(TO HOLD THIRTY GALLONS)
Is intended for all large Establishments where much watering is done by the watering-pot. By its use much time and labour of the Gardener are saved, particularly where the Tank, Pond, or Pump, is at a distance from the garden. May be obtained of any Ironmonger in town or country for 3*l.* 3*s.*
Manufactured by
John Warner & Sons, 8, Crescent, Jewin Street, London.

JOHN WARNER AND SONS,
Crescent, Jewin Street, London.
GALVANISED IRON TUB GARDEN ENGINE,
With Warner's Registered Spreader,
is strongly recommended, for durability and low price, viz., 2*l.* 19*s.*, to hold 10 gallons.
Larger sizes in wood or iron, viz., 14 gals., 24 gals., & 35 gals. May be obtained of any Ironmonger or Plumber in town or country, or of the Patentees and Manufacturers, as also Machinery of all kinds for raising Water from any depth to any height by Steam, Horse, or Manual Power. Prices sent on application. Syringes of various constructions and sizes from 9*s.* upwards. Metallic String from 5*d.* to 1*s.* 3*d.* per lb.

TO AGRICULTURISTS AND OTHERS.

SIMPSON AND BARNES, Openshaw, near Manchester, beg to call the attention of parties requiring power to their PORTABLE and STATIONARY STEAM-ENGINES, from one-horse power and upwards, having the boiler and engine attached. They require no foundation, are simple and cheap, and are sent from the works ready to start when they arrive at their destination.

OAT-CRUSHING AND BEAN-SPLITTING MILL
(Turner's No. 5).

This Mill is recommended to the use of every person keeping a Horse, as superior for efficiency, durability, and ease in working to any manufactured. Two bshls. of crushed corn afford more nourishment both to old and young horses than three bushels of uncrushed!

Price £5 15*s.* 6*d.*

Made and Sold by
E. R. & F. TURNER, St. Peter's Iron Works, Ipswich.

PARKES' STEEL DIGGING FORKS & DRAINING TOOLS.
MESSRS. BURGESS AND KEY, as Mr. Parkes' Wholesale Agents for England, have always in stock a large assortment. These Forks and Tools are now in use by upwards of 1000 of the Nobility and Farmers, members of the Royal Agricultural Society, who pronounce them to be the best ever invented, and to facilitate labour at least 20 per cent. Price Lists sent free on application, and Illustrated Catalogue of the best Farm Implements, on receipt of eight postage stamps.
103, Newgate Street, London.

MAPPIN'S PRUNING KNIVES IN EVERY VARIETY,
Warranted Good by the Makers.

JOSEPH MAPPIN and BROTHERS, Queen's Cutlery Works, Sheffield; and 37, Moorgate Street, London.
Drawings forwarded by post.

LIST OF GARDEN ORNAMENTS MANUFACTURED IN
AUSTIN'S ARTIFICIAL STONE, at Nos. 1 to 4, Keppel Row, New Road, Regent's Park, London.

94 Statues and small Figures.
38 figures of Animals.
17 „ of Birds.
16 Baskets of suitable Pedestals; prices from 12*s* to 30*l.* Some of these are beautiful ornaments for lawns.
12 different patterns of Flower Boxes for Windows, &c.
Garden Seats.
15 Sun-dial Pedestals.
16 Shells for either Water or Rock Plants; the largest size is 12 feet diameter.
Pedestals, square, circular, and octagonal, of almost every size. N.B. These are always perforated, to allow drainage from a vase.
43 Groups of Figures, single Figures, or Architectural Flowers, designed for centre ornaments of fountains.
Ornamental Copings to Ground Basins of Fountains, from 37 feet diameter to any smaller size.

FOUNTAINS.
Austin & Seeley having erected 218 of these works in various parts of the kingdom since the year 1836, may be presumed to have more experience than any other persons engaged in such work. Their collection now comprises about 200 designs, some of which are of the highest class; and they are now paying special attention to this department of the business, in the expectation that the local water works in course of erection will facilitate the supply of *jets d'eau.* The prices range from 10*l.* to 400*l.*

THE HYDRAULIC RAM will raise water, without manual labour, to any height, where a small fall can be obtained.
PARSEY'S PATENT REVOLVING PUMP lifts three times the quantity of water with the same labour, than any other Pump.
Fire, Garden, Deep Well, Liquid Manure, and all other Pumps.
Fountains of every description erected; Rockwork, Grottoes, &c.
Hose Pipe of every kind for watering Gardens.
W. F. Roe (late Freeman Roe), Hydraulic Engineer, 70, Strand, London.

COTTAM AND HALLEN have on Show, at their Repository, No. 2, Winsley Street, Oxford Street, London, a great variety of the following articles for the Garden, &c., at very low prices, viz.:—Garden Rollers, Cast-Iron Rickstands, Garden Engines, Mowing Machines, Garden Chairs, Superior Garden Tools of all kinds, Garden Vases and Pedestals in great variety, and a large assortment of Horticultural and Agricultural Implements.
Ornamental Wire Flower Stands, Pot Trainers, Rose Tree Guards, Flower Bordering, and every description of Wire Work, both plain and ornamental.
Hand Glass Frames, Cast and Wrought Iron Flower Stakes, Garden Arches, &c.
Strong Iron Hurdles, and best Wire for Strained Wire Fencing.
Hothouses, Conservatories, &c., made upon the most improved principle, either of Iron, or of Iron and Wood combined, which can be fixed complete, with Hot Water Apparatus, in any part of the Kingdom. Show Rooms at the Manufactory, 2, Winsley Street, Oxford Street, opposite the Pantheon, where every information may be obtained.

SLATE WORKS, ISLEWORTH, MIDDLESEX.
EDWARD BECK Manufactures in Slate a variety of articles for Horticultural purposes, all of which may be seen in use at Worton Cottage, on application to the Gardener, Sundays excepted.
Priced Lists of Plant Tubs and Boxes forwarded on application.

HOSE PIPING.
WAITHMAN'S PATENT FLAX HOSE PIPING will sustain a greater pressure, is lighter, less bulky, will wear longer, and is about 60 per cent. cheaper than the leather hose pipe.
Manufactured only by Waithman & Co., Bentham, Lancaster.
No. 1 Quality, Inches in Diameter and Price Per Yard:—½, 9*d.*; ¾, 11*d.*; 1, 1*s.* 1*d.*; 1¼, 1*s.* 3*d.*; 1½, 1*s.* 5*d.*; 1¾, 1*s.* 7*d.*; 2, 1*s.* 9*d.*; 2¼, 2*s.*; 2½, 2*s.* 3*d.*; 2¾, 2*s.* 6*d.*; 3, 2*s.* 9*d.*
Super Extra Stout Quality:—2, 2*s.*; 2¼, 2*s.* 3*d.*; 2½, 2*s.* 6*d.*; 2¾, 2*s.* 9*d.*; 3, 3*s.*
No. 0, a cheaper Hose, to bear a low pressure for Garden and Agricultural purposes, at greatly reduced prices:—1, 9*d.*; 1¼, 10*d.* 1½, 11*d.*; 2, 1*s.*; 2¼, 1*s.* 3*d.*; 2½, 1*s.* 6*d.*
The Hose is Burnettised at an extra charge of 3*d.* per yard.
Union Joints, Branch Pipes, and Jets are also supplied.

CARSON'S ORIGINAL ANTI-CORROSION PAINT, specially patronised by the British and other Governments, the Hon. East India Company, the principal Dock Companies, most public bodies, and by the nobility, gentry, and clergy, for out-door work at their country seats. The Anti-Corrosion is particularly recommended as the most durable out-door Paint ever invented, for the preservation of every description of Iron, Wood, Stone, Brick, Compo, Cement, &c., work, as has been proved by the practical test of upwards of 60 years, and by the numerous (between 500 and 600) testimonials in its favour, and which, from the rank and station in society of those who have given them, have never yet been equalled by anything of the kind hitherto brought before the public notice.
Lists of colours, prices, together with a copy of the testimonials, will be sent on application to Walter Carson & Son, 9, Great Winchester Street, Old Broad Street, Royal Exchange, London. No Agents. All orders are particularly requested to be sent direct.

GLASS FOR CONSERVATORIES, GREENHOUSES, PIT FRAMES, ETC.

HARTLEY'S Rough Plate, Sheet and Rough, Tiles, Striking and Bee Glasses, Milk Pans, Cucumber Tubes, and Wasp Traps, as Horticultural List.

Milled Sheet, White Lead, and Lead Pipe. Paints, Colours, and Varnishes, see Colour List, which can be had on application. Established more than 100 years.

"FRIGI DOMO."—Patronised by her Majesty the Queen, the Duke of Northumberland for Syon House, his Grace the Duke of Devonshire for Chiswick Gardens, Professor Lindley for the Horticultural Society, Sir Joseph Paxton for the Crystal Palace, Royal Zoological Society, late Mrs. Lawrence, of Ealing Park, and — Collier, Esq., of Dartford.

PROTECTION FROM MORNING FROST.

"FRIGI DOMO," a Canvas made of patent prepared Hair and Wool, a perfect non-conductor of Heat and Cold, keeping, wherever it is applied, a fixed temperature. It is adapted for all horticultural and floricultural purposes, for preserving Fruits and Flowers from the scorching rays of the sun, from wind, from attacks of insects and from morning frosts. To be had in any required length, 2 yards wide, at 1s. 6d. per yard run, of ELISHA THOMAS ARCHER, whole and sole manufacturer, 7, Trinity Lane, Cannon Street, City, and the Royal Mills, Wandsworth, Surrey; and of all Nurserymen and Seedsmen throughout the kingdom. "It is much cheaper than mats as a covering."

WATERPROOF PATHS. BARN AND CATTLE SHED FLOORS.

THOSE who would enjoy their Gardens during the winter months should construct their walks of PORTLAND CEMENT CONCRETE, which are formed thus:—Screen the gravel of which the path is at present made from the loam which is mixed with it, and to every part of clean gravel add one of sharp river sand. To five parts of such equal mixture add one of Portland Cement, and incorporate the whole well in the dry state before applying the water. It may then be laid on 2 inches thick. Any labourer can mix and spread it. No tool is required beyond the spade, and in 48 hours it becomes as hard as a rock. Vegetation cannot grow through or upon it, and it resists the action of the severest frost. It is necessary, as water does not soak through it, to give a fall from the middle of the path towards the sides.

The same preparation makes first-rate paving for BARNS, CATTLE-SHEDS, FARM-YARDS, and all other situations where a clean, hard bottom is a desideratum. May be laid in winter equally well as in summer.

Manufacturers of the Cement, J. B. WHITE & BROTHERS, Milbank Street, Westminster.

PAXTON WORKS, SHEFFIELD.

SAYNOR AND COOKE, Manufacturers of the celebrated Exhibition Prize PRUNING, BUDDING, and GRAFTING KNIVES, VINE and PRUNING SCISSORS, &c. These articles are Warranted to stand any kind of work, and to carry the keen edge of a razor without requiring to be sharpened so frequently as is usually necessary to obtain that sharp edge so requisite for the comfort and use of the practical gardener. The blades are also warranted to wear through to the back. They are used by all the eminent gardeners in England, Ireland, and Scotland, and can be purchased of any nurseryman or seedsman in the three kingdoms. Those who may not have used them are respectfully solicited to give them a trial. The Great Exhibition Prize Medal of 1851, and the Prize Medal of the Horticultural Society of Manchester, at their Show of 1854, was awarded to SAYNOR & COOKE for their superiority of material and workmanship. Established 1738.

NO CHARGE FOR STAMPING at LOCKWOOD'S, 75, New Bond Street. Good cream-laid Note-paper, five quires for 9d.; Thick ditto, five quires, 1s.; Albert and Queen's sizes, five quires for 6d., 9d., and 1s.; Note-paper made from Straw, 2s. 6d. per ream; Envelopes, 4d. to 1s. 6d. per hundred; Foolscap paper, 7s. 6d. per ream; Copybooks 2s. 6d. per dozen. Card Plate engraved, 2s. 6d.; 100 Cards printed, 2s. 6d. Wedding orders promptly executed. A large variety of Writing and Dressing Cases, Envelope Boxes, Blotting Books, Inkstands.—Copy address, LOCKWOOD'S, 75, New Bond Street. Country orders for 20s. sent carriage free. LOCKWOOD'S celebrated Nugget (Gilt) Pen, 1 doz. post free for 13 stamps.

TOURISTS, TRAVELLERS, AND OTHERS,

EXPOSED TO THE SCORCHING RAYS OF THE SUN, AND HEATED PARTICLES OF DUST, WILL FIND

ROWLAND'S KALYDOR a most refreshing preparation for the Complexion, dispelling the cloud of languor and relaxation, allaying all heat and irritability, and immediately affording the pleasing sensation attending restored elasticity and healthful state of the skin. Freckles, Tan, Spots, Pimples, Flushes, and Discoloration fly before its application, and give place to delicate clearness, with the glow of beauty and of bloom. In cases of sunburn or stings of insects, its virtues have long been acknowledged. Price 4s. 6d. and 8s. 6d. per bottle.

ROWLAND'S MACASSAR OIL, a delightfully fragrant and transparent preparation, and as an invigorator and purifier beyond all precedent.

ROWLAND'S ODONTO, OR PEARL DENTIFRICE, a White Powder, compounded of the rarest and most fragrant exotics. It bestows on the teeth a pearl-like whiteness, frees them from Tartar, and imparts to the Gums a healthy firmness, and to the breath a grateful sweetness and purity.

Sold by A. ROWLAND & SONS, 20, Hatton Garden, London; and by Chemists and Perfumers.

DO YOU WANT LUXURIANT HAIR, WHISKERS, &c.?—ROSALIE COUPELLE'S CRINUTRIAR is guaranteed to produce Whiskers, Moustachios, &c., in a few weeks, and restore the Hair in baldness from whatever cause, strengthen it when weak, prevent its falling off, and effectually check greyness in all its stages. For the nursery it is recommended by upwards of 100 physicians, for promoting a fine healthy head of hair, and averting baldness in after years. Sold by all Chemists, price 2s., or sent post free on receipt of 24 penny stamps, by Miss COUPELLE, 69, Castle Street, Newman Street, Oxford Street, London. Mrs. CARTER writes, "My head, which was bald, is now covered with new hair." Mrs. REEVE—"My hair is gaining strength and thickness." Sergeant CRAVEN.——"Through using it I have an excellent Moustache." Mr. YATES—"The young man has now a good pair of whiskers. I want two packets for other customers."

METCALFE AND CO.'S NEW PATTERN TOOTH BRUSH, PENETRATING HAIR BRUSHES, AND SMYRNA SPONGES.—The Tooth Brush performs the highly-important office of searching thoroughly into the divisions and cleansing in the most extraordinary manner—hairs never come loose. Peculiarly penetrating Hair Brushes, with durable unbleached Russian bristles, which will not soften like common hair, and immense stock of genuine unbleached Smyrna Sponge, with every description of British and Foreign Perfumery, at METCALFE, BINGLEY, & Co.'s only Establishment, 130 B and 131, Oxford Street, second and third doors west from Holles Street.

CAUTION.—Beware of the word "from" Metcalfe's, adopted by some houses. Metcalfe's Alkaline Tooth Powder, 2s. per box.

A CLEAR COMPLEXION,

GODFREY'S EXTRACT OF ELDER FLOWERS is strongly recommended for softening, beautifying, and preserving the skin, and giving it a blooming and charming appearance, being at once a fragrant Perfume and delightful Cosmetic. It completely removes tan, sun-burn, redness, &c., and by its balsamic and healing qualities renders the skin soft, and free from dryness, scurf, &c.; clears it from every humour, pimple, or eruption; and by continuing its use only a short time the skin becomes and continues soft and smooth, and the complexion clear and beautiful. In the process of shaving it is invaluable, as it annihilates every pimple and all roughness, and affords great comfort if applied to the face during cold easterly winds.—Sold in Bottles, price 2s. 9d., with directions for using it, by all Medicine Vendors and Perfumers.

FOR THE BENEFIT OF SUFFERING HUMANITY.—A retired gentleman having cured himself of Deafness, Defect of Sight, and General Debility, after suffering upwards of 25 years, thinks it his duty to make the remedy known for the benefit of the afflicted; he will therefore forward the particulars for the cure of the same on receipt of a stamped envelope properly directed.—Address Rev. J. JOHNSTONE, No. 1, Park Terrace, Heavitree, Exeter, Devonshire.

DEBILITY AND NERVOUSNESS.—Encouragement to those in despair, and suffering from debility, spermatorrhœa, relaxation, nervousness, and exhaustion of the system. Advice and prescriptions, with a treatise on these diseases, for a successful course of self-treatment, by which a permanent cure of the most protracted case is effected, sent post free upon receipt of 14 postage stamps, by E. J. ROBERTS (late Army), Surgeon, 9, North Terrace, Moor Edge, Newcastle-on-Tyne.

CURE OF COUGH AND RESTORATION OF VOICE BY DR. LOCOCK'S PULMONIC WAFERS.—"7, Alicia Street, Sculcoats, Hull. Sir,—Having been cured of a most obstinate hoarseness and cough by means of Dr. LOCOCK'S Wafers, and having spent pounds in seeking relief, but all to no purpose, I scarcely know how to express my gratitude for the surprising and sudden change they have wrought upon me.

"To Mr. Reinhardt, chemist, Market Place. J. MEMELL."

Dr. LOCOCK'S Wafers give instant relief, and a rapid cure of asthma, coughs, &c. They have a pleasant taste.—Price 1s. 1½d., 2s. 9d., and 11s. per box. Sold by all Druggists. Beware of counterfeits.

HOLLOWAY'S PILLS EXTRAORDINARY IN THE CURE OF DROPSY.—Sarah James, living with Mrs. Wilders, of Oldham Road, Manchester, had become of such a size from Dropsy as to be a burthen to herself; every usual treatment was used but without effect. In this sad state she tried HOLLOWAY'S Pills, and by them alone the water was entirely removed from her system, and an effectual cure perfected. The Pills were lately tried on two dropsical patients discharged as incurable from a London Hospital, and both were cured by this famous medicine.—Sold by all Medicine Vendors throughout the world; at Professor HOLLOWAY'S Establishments, 244, Strand, London, and 80, Maiden Lane, New York; by A. STAMPA, Constantinople; A. GUIDICY, Smyrna; and H. HOODS, Malta.

SISAL CIGARS, SISAL CIGARS, SISAL CIGARS!

GOODRICH'S CIGAR, TOBACCO, AND SNUFF STORES (Established 1780), 416, Oxford Street, nearly opposite Hanway Street. A Box, containing 14 fine Sisal Cigars for 1s. 9d.; post free for 27 stamps. None are genuine unless signed "H. N. GOODRICH."

TO BE LET, CHERINGTON WOODSIDE FARM, in the parish of Warkworth, Northumberland; tithe free, and entered to at May-day, 1856, containing about 566 acres, of which 90 acres are in old Grass. The tillage land is of sound good quality, and the old Grass is very valuable fattening pasture. A large portion of the farm has been thorough drained under Government grant. The Farm is within two miles of the Addington Station. Mr. Thos. Brown, of Whitefield House, near Acklington, will show the farm with a plan.—Further particulars may be had by application to GEORGE A. GREY, Esq., Millfield, Northumberland, by whom offers will be received till 12th Nov.

FLORIST'S BUSINESS.

TO BE SOLD, the NURSERY GROUND, GREENHOUSES, &c., of the late Mr. HENRY GROOM, at Clapham Rise, Surrey, in consequence of his death, and the GOODWILL of the well-established BUSINESS to be disposed of. The Premises (exclusive of a strip of land held rent free, subject to six months' notice) comprise 3¼ acres, and are held at the low yearly rent of 80l. for an unexpired term of 36 years from Michaelmas, 1855. The House adjoining, late in the occupation of Mr. Groom, is not comprised in the lease, but may be rented. The Tulips and other Bulbs and Roots not in the Ground will be sold by auction on the premises in October next, the particulars of which are in preparation, and due notice will be given of the time of sale.—The Premises may be viewed on application, and further information obtained of Messrs. PROTHEROE & MORRIS, American Nursery, Leytonstone, Essex; and of Messrs. BARNES & BERNARD, Solicitors, 2, Great Winchester Street, London.

TO NURSERYMEN, AND OTHERS.

TO BE SOLD, and may be entered upon immediately, a NURSERY and SEED BUSINESS, in a large and populous town in the West of England, having been established upwards of 70 years.—For particulars and all information, apply to X. Z., Office of this Paper; or to Mr. LOWE, Upper Clapton Nursery; Mr. A. HENDERSON, Nursery, Pine-apple Place, Edgeware Road; also to J. A. HENDERSON, Esq., 64, Hamilton Terrace, St. John's Wood, London.—Sept. 22.

TO NURSERYMEN AND FLORISTS.

TO BE SOLD, three miles from Oxford Street, situated in the main road, a respectable and convenient DWELLING HOUSE, containing six rooms, washhouse, and stabling; half an acre of good Land, with a small Greenhouse, suitable for a show-house, situated in an improving neighbourhood for jobbing. Would suit a young beginner well. Terms moderate.—For further particulars inquire of Mr. WHITE, Wheatsheaf Tavern, New Road, Shepherd's Bush.

CYGNETS.

TO BE SOLD, either together or separately, six remarkably fine CYGNETS. Price per pair, 2l.; for the whole brood, 5l.—Apply to Messrs. SUTTON & SONS, Market Place, Reading.

NURSERY STOCK.

H. BIGLAND AND CO. beg to state that the LEASE of their NURSERY having now expired, they have concluded to offer the remainder of their STOCK (consisting of Evergreens, Fruit, and Forest Trees, Greenhouses, &c.) by Auction this autumn; the precise time will be named in a future Advertisement.

Britannia Nursery, Whalley Range, Manchester.

Sales by Auction.

THE LIVE STOCK, FARM, AND GARDEN IMPLEMENTS AT EALING PARK.

MR. J. C. STEVENS will sell by Auction at the Farmyard, Ealing Park (5 minutes' walk from the Brentford Station, South Western Railway) on THURSDAY, Sept. 27th, at 1 o'clock precisely, the LIVE STOCK, comprising six handsome Milch Cows, two Heifers, three Calves, two Farm Horses, three Sows and eight Store Pigs, 400 head of Poultry and Coops, with the Farm and Garden Implements, comprising Rick Cloth and Poles, Iron Horse Roller, two Garden Rollers, Garden Frames, Chaff Boxes, a 54 Round Ladder, Water Barrows and Tubs, Water Cart, Plant Van, 700 feet of Boarding, useful Wood and Iron Birdcages, and sundry old stores.—May be viewed on the day prior and morning of Sale, and Catalogues had on the premises, and of Mr. J. C. STEVENS, 38, King Street, Covent Garden.

GRANGE ROAD, BERMONDSEY.

To NOBLEMEN, GENTLEMEN, AND PINE GROWERS.

MR. W. T. ATTWOOD will Sell by Auction, on the premises, without the least reserve, the extensive stock of healthy PINE PLANTS, principally Queens, together with the various Ranges of Graperies and Forcing Pits, also the whole of Hot-Water Apparatus, comprising about 1500 feet of pipe and three large Boilers. The above property is in good condition, and offers a valuable opportunity to persons requiring Pine Plants and Forcing Houses. Due notice of the sale will be given in the course of a few weeks.

HACKNEY.

To GENTLEMEN, NURSERYMEN, AND OTHERS.

MESSRS. PROTHEROE AND MORRIS are directed by Messrs. Brown & Taylor to sell by auction, without reserve, on the premises, Hackney Nursery, Dalston Lane, Middlesex, on THURSDAY, October 11th, 1855, at 11 o'clock, the whole of the Nursery Stock, comprising Ornamental Fruit and Forest Trees, Evergreens and Deciduous Shrubs; also the Greenhouse Plants, consisting of Camellias, Azalea Indica, Acacias, Cytisus, Myrtles, Deutzia gracilis, Forsythias, &c.; together with two Greenhouses, Pits, Two and Three Light Boxes, a quantity of Hot-water Pipe, Boilers, Wheelbarrows, capital Nest Seed Drawers, Counter, Garden Tools, and sundry effects.—May be viewed prior to the sale; Catalogues may be had on the premises, of the principal Seedsmen in London, and of the Auctioneers, American Nursery, Leytonstone, Essex.

CLARENDON NURSERIES, CAMBERWELL.

MESSRS. PROTHEROE AND MORRIS are instructed by Mr. Joseph Fryer to submit to public competition on the above premises, on the 8th, 9th, and 10th days of October, at 11 o'clock each day, a portion of his extensive Nursery Stock, consisting of fine Standard and Dwarf Trained and Untrained Apple, Pear, Plum, Cherry, Peach, Nectarine, Apricot, Fig, Raspberry, Gooseberry, Currant, &c.; 2000 Mulberries, the finest stock in the trade, 4 to 10 ft.; 3000 Limes, 6 to 10 ft.; 4000 Lilacs of all sorts, 3 to 10 ft.; 2000 Evergreen Oaks, 2 to 5 ft.; 4000 Evergreen Privet, 3 to 6 ft.; also large quantities of Scarlet, White, and other Rhododendrons, Azaleas, Andromedas, Magnolias, and other varieties of American Plants; Garryas, Glycines, Clematis, Passion Flowers, Bignonias, Virginian Creepers, Ivies, Box, Laurels, Althæas, fine large Elms, Lombardy and Balsam Poplars, Acacias, Scarlet Thorns, fine strong Seakale, &c. &c.—May be viewed prior to the sale, and Catalogues may be had on the premises, of the principal Seedsmen, and of the Auctioneers, American Nurseries, Leytonstone, Essex.

On the 29th September will be published, in handsome Folio, price 6s., Part VII. of

THE FERNS OF GREAT BRITAIN,

NATURE-PRINTED (LIFE SIZE).

Parts I. to VI. are always on sale.

BRADBURY & EVANS, 11, BOUVERIE STREET.

On the 29th of September will be published, price 2s., Part XXXI. of

THE ENGLISH CYCLOPÆDIA, extending the NATURAL HISTORY DIVISION from SCINCOIDÆ to SKIN; and the GEOGRAPHICAL DIVISION from SUNDA ISLANDS to THIAN-SHAN-NANLU, including among numerous others articles on Surat, Susa, Sweden, Switzerland, Sydney, Syracuse, Syria, Syrtes, Tabriz, Taiwan, Taman, Tambow, Tangut, Tarakai, Taranto, Tarsus, Taurica Chersonesus, Taurida, Temeswar, Tenasserim, Tennessee, Texas, Thapsacus, Thebes, Thesprotia, Thessalonica, Thessaly, &c. &c.

BRADBURY & EVANS, 11, Bouverie Street, Fleet Street.

Lately Published,

THE ELEMENTS OF BOTANY, STRUCTURAL AND PHYSIOLOGICAL. With a Glossary of Technical Terms, and numerous Illustrations. 12s. cloth.

This completes the series of Elementary Botanical Works by Professor LINDLEY, of which "School Botany," and "The Vegetable Kingdom," form the other parts.

The first two Parts of THE ELEMENTS OF BOTANY, comprising Structural and Physiological Botany, and a Glossary of Technical Terms, are published in one octavo volume, price 12s.

These three parts form a complete manual of Botany for Medical and other Students who have made themselves acquainted with the author's "School Botany."

N.B. The Glossary may be had separately, price 5s.

BRADBURY & EVANS, 11, Bouverie Street.

MORTON'S NEW FARMER'S ALMANAC.

Early in November will be Published,

A NEW FARMER'S ALMANAC. Price 1s. By JOHN C. MORTON, Editor of the "Agricultural Gazette," the "Cyclopedia of Agriculture," &c.

Along with the usual contents of an Almanac, it will include:—1. Monthly directions for the operations of the Farm and Garden. 2. Short notices of the past year's Agricultural novelties and progress. 3. Such an Index to current Agricultural Literature as will direct the student to sources of information on the principal Agricultural topics. 4. A list of the more important of those well-established facts in Farm experience, which may serve as trustworthy data in Agricultural Estimates and Calculations. 5. Short references to the treatment proper under the more common Diseases to which Farm Stock are liable. 6. A series of Instructions and Receipts in many particulars of Household, Garden, Field, and Dairy Management. 7. A guide to the more important of our Fairs and Markets, with information as to times and places where the different kinds and breeds of Stock may be best obtained. 8. An index to the Meetings, Office-bearers, and objects of our principal Agricultural Societies and Farmers' Clubs.

The object throughout will be, by good arrangement and close packing, to furnish as much Agricultural information of practical usefulness as can be issued by the printer and the publisher for 1s.

London: BLACKIE & SON, Warwick Square; and Glasgow and Edinburgh.

NEW PART OF COPLAND'S DICTIONARY.

This day is published, in 8vo, price 4s. 6d., Part XVII. of

DR. COPLAND'S MEDICAL DICTIONARY.

London: LONGMAN, BROWN, GREEN, & LONGMANS.

In post 8vo, sewed, price One Shilling,

THE CURABILITY OF CONSUMPTION; being a Series of Papers, presenting the most prominent and important practical points in the Treatment of the Disease. By F. H. RAMADGE, M.D., Fellow of the College of Physicians, late Senior Physician to the Royal Infirmary for Diseases of the Chest, &c. Also, by the same Author, price 10s. 6d.,

A TREATISE ON ASTHMA AND DISEASES OF THE HEART.

London: LONGMAN, BROWN, GREEN, & LONGMANS.

NEW AND ENLARGED EDITION OF DR. LINDLEY'S THEORY OF HORTICULTURE.

Just Published, in 8vo, with 98 Woodcuts, price 21s. cloth,

THE THEORY AND PRACTICE OF HORTICULTURE; or, an Attempt to explain the chief Operations of Gardening upon Physiological Grounds: being the Second Edition of the "Theory of Horticulture," much enlarged. By JOHN LINDLEY, Ph.D., F.R.S., Corresponding Member of the Institute, Vice-Secretary of the Horticultural Society, Professor of Botany in University College, London, &c.

"The First Edition of this valuable work was issued in 1840, since which time it has had an extensive circulation, and has been translated into the German, Dutch, and even Russian languages. Being more particularly restricted to principles, however, the author at length resolved to render the work more generally interesting and useful by a more frequent reference to practical operations. He has thus greatly extended the matter, by supporting the physiological doctrines with an appeal to facts familiar to cultivators, or which ought to be; and the result is a still more interesting and popular compendium of the principles and practice, or the science and art, of horticulture."—*Builder.*

"This is a Second Edition of the "Theory of Horticulture," with the addition of a large quantity of practical matter, introduced to show how entirely scientific principles and good cultivation correspond. The volume contains about four times as much matter as the first edition . . . . Although very large additions are made to every chapter, while many passages in the first edition have been wholly struck out, it may be proper to say that the greatest changes are those which relate to vitality, climate, domestication, ventilation, propagation, pruning, resting, and soils and manures; such being the subjects in which practical men are most interested. The whole work has, indeed, assumed such a form as to make it evident that the great object of the author has been, not to produce a work suited to men of science, but one which every well informed gardener may understand and apply. As the volume concludes with a very copious index of matter, there is no difficulty in ascertaining where any given subject is treated of."—*Gardeners' Chronicle.*

By the same Author,

INTRODUCTION TO BOTANY. 4th Edition, greatly enlarged; with 6 Plates, and numerous Wood Engravings. Two vols. 8vo, 24s.

*** It has been the Author's wish to bring every subject that he has introduced down, as nearly as possible, to the state in which it is found at the present day. In doing so, he has added so very considerable a quantity of new matter, especially in what relates to Vegetable Anatomy and Physiology, that the present Edition may be considered, in those respects, a new work.

London: LONGMAN, BROWN, GREEN, & LONGMANS.

Now ready,

THE FERNS OF GREAT BRITAIN: Illustrated by JOHN E. SOWERBY. The Descriptions, Synonyms, &c., by Charles Johnson, Esq. In One Vol. cloth boards, containing 49 Plates, full coloured, 27s.; partly coloured, 14s.

MILNER'S Phœnix (212°) Safe Works, Liverpool, the most complete and extensive in the world. Show Rooms, 6 and 8, Lord Street, Liverpool. London Depôt, 47A, Moorgate Street, City. Circulars free by post.

DR. DE JONGH'S

LIGHT BROWN COD LIVER OIL. Prescribed with complete confidence by the Faculty for its purity, and superior, immediate, and regular efficacy.

It is entirely free from nauseous flavour, and being invariably and carefully submitted to chemical analysis—AND ONLY SUPPLIED IN SEALED BOTTLES TO PRECLUDE SUBSEQUENT ADMIXTURE OR ADULTERATION—this Oil possesses a guarantee of genuineness and purity offered by no other Oil in the market.

TESTIMONIAL from **ARTHUR H. HASSALL,** M.D., F.L.S., M.R.C.P., Chief Analyst of the Sanitary Commission of the *Lancet*, Author of "Food and its Adulterations," &c. &c. &c.

"I have more than once, at different times, subjected your Light Brown Oil to chemical analysis—AND THIS UNKNOWN TO YOURSELF—and I have always found it to be free from all impurity and rich in the constituents of bile. So great is my confidence in the article, that I usually prescribe it in preference to any other, in order to make sure of obtaining the remedy in its purest and best condition."

Sold only in bottles, capsuled and labelled with Dr. DE JONGH'S Signature, WITHOUT WHICH NONE ARE GENUINE, by ANSAR, HARFORD, & CO., 77, STRAND, London, Dr. DE JONGH'S sole Consignees; and by most respectable Chemists in town and country.

Half-pints (10 oz.), 2s. 6d.; Pints (20 oz.), 4s. 9d.; Quarts (40 oz.), 9s.; IMPERIAL MEASURE.

"A LIST OF PLANTS," including RARE and HARDY CONIFERS, HARDY ORNAMENTAL SHRUBS and CLIMBERS, GREENHOUSE PLANTS, ERICAS, EPACRIS, CAMELLIAS, GERANIUMS, CARNATIONS, PICOTEES and PINKS, HOLLYHOCKS, PHLOXES, CHRYSANTHEMUMS, HARDY HERBACEOUS PLANTS, &c.

Cultivated and Sold by Youell and Co., Royal Nursery, Yarmouth, Norfolk, is now ready, and will be forwarded on receipt of two postage stamps.

ROSE CATALOGUE, ETC.

H. LANE and SON'S CATALOGUE of ROSES, TREES and SHRUBS, and FRUIT, will be ready the 1st of October, and will be sent as usual to their customers. Parties intending to purchase can have them on application to the Nurseries, Great Berkhamstead, Herts. Also Catalogues of Azaleas, Stove and Greenhouse, and Herbaceous Plants.

FRUIT TREES IN POTS.

H. LANE and SON have the pleasure of announcing that their very extensive collection of FRUITS IN POTS are now ready for sending out, well set with bloom-buds, consisting of Peaches, Nectarines, Apricots, Cherries, Plums, Pears, Apples, &c., and are quite worthy the attention of those who take a delight in this particular branch of horticulture.
The Nurseries, Great Berkhamstead, Berks.

FINE FRINGED CHINESE PRIMROSE.

J. and J. FRASER beg to offer some excellent Seed of the above, saved from plants which obtained the award of the Horticultural Society last winter, in packets at 2*s*. 6*d*. each. A remittance in stamps is requested from unknown correspondents.—Lea Bridge Road, Sept. 29.

VINES FOR FRUITING IN POTS.

MESSRS. J. and J. FRASER, Nurserymen, Lea Bridge Road, Essex, beg to announce that they have a very choice selection of the best sorts of VINES from eyes grown in 12 and 15-inch pots, Price 5*s*. and 7*s*. 6*d* each.
N.B. Strong Vines for planting out, 3*s*. 6*d*. each.—Sept. 29.

TO AMATEURS IN CONIFERÆ.

MR. BARRON, of Elvaston Castle, will send out in a few days his Seedling Plants of PICEA NOBILIS. They are three years old, very strong for their age, with splendid roots, never having been in pots. Largest size, 63*s*. (very few of this size remain unsold); next size, 42*s*. A remittance or reference from unknown correspondents ordering after this date.

TO THE SEED TRADE.

GEORGE TABER, of Ravenhill, Essex, begs to inform the Trade that his growing crops of Seeds are now open to inspection. All Turnip Seeds grown from sound transplanted roots. Lists sent on application.—Sept. 29.

DOUBLE ROMAN and PAPER WHITE NARCISSUS, 4*s*. per dozen.—The above Bulbs, the former of which is so justly esteemed for its early blooming and excessive fragrance, and the latter for its purity and elegance, have just arrived, and may be obtained at A. Corbett's Italian and Foreign Warehouse, 18, Pall Mall, near Waterloo Place, London.

BARRATT'S MAGNUM BONUM has this year fully sustained its high character as one of the finest flavoured STRAWBERRIES known, and may now be had at 20*s*. per 100, or 3*s*. per doz.—Catalogues containing all the leading varieties of the day may be obtained from William Barratt, St. John's Nurseries, Wakefield.

NURSERY STOCK.

H. BIGLAND and CO. beg to state that the LEASE of their NURSERY having now expired, they have concluded to offer the remainder of their STOCK (consisting of Evergreens, Fruit, and Forest Trees, Greenhouses, &c.) by Auction this autumn; the precise time will be named in a future Advertisement.
Britannia Nursery, Whalley Range Manchester.

DUTCH FLOWERING BULBS.

JAMES CARTER and CO.'s CATALOGUE OF DUTCH AND CAPE BULBS, the most comprehensive and select published, will be forwarded *free of charge* and *post paid*, upon application to address at foot. *The Bulbs are as usual of first-rate quality.*
James Carter & Co., 238, High Holborn, London.

R. PARKER begs to inform his friends and patrons that his PRICED CATALOGUE of DUTCH BULBS is now ready, and will be forwarded post free upon application.
Paradise Nursery, Hornsey Road, Holloway.

IMPORTED DUTCH BULBS.

JAMES GRAHAM begs to announce that his priced Catalogue of DUTCH BULBS is now ready, and can be had free on application.—Seed and Horticultural Establishment Northgate, Chichester (late Silverlock and Son.)—Sept. 29.

WILLIAM CUTBUSH and SON beg to acquaint their patrons and friends that their ANNUAL CATALOGUE of DUTCH BULBS can be had, postage free, on application. The superior quality of their roots is well known, but as a further guarantee they obtained the Awards at the Horticultural Society's Rooms, Regent Street, last spring.
Highgate Nurseries, near London.

DUTCH HYACINTHS AND OTHER BULBS.

J. and J. FRASER beg to announce that they have received their annual importation of HYACINTHS and other FLOWER ROOTS, of which a descriptive Catalogue may be had by enclosing one postage stamp. This Catalogue contains some instructions for the successful cultivation of the various roots.—Lea Bridge Road, Sept. 29.

DUTCH FLOWER ROOTS.

PETER LAWSON and SON, Seedsmen and Nurserymen to Her Majesty the Queen, and to the Highland and Agricultural Society of Scotland, respectfully intimate that they are now ready to execute orders for HYACINTH ROOTS, &c., &c., of the finest kinds and in excellent condition Catalogues may be had, free, on application.
27, Great George Street, Westminster.—Sept. 29.

IMPORTED DUTCH BULBS.

EVAN PAUL begs to inform his patrons and friends that he has received his first importation of the above, which have arrived in first-rate condition, early orders for which are respectfully solicited. Catalogues forwarded postage free on application.—The Nurseries, Derby, Sept. 29.

DUTCH BULBOUS ROOTS.

MARTIN and SON have much pleasure in informing their friends that they have received in good condition their annual importation of the above, which are particularly fine, and trust to be favoured with early orders.—Catalogues may be had and also of their Nursery Stock for two stamps.—Nursery and Seed Establishment, Cottingham (1788); Hull Branch, Junction Street.

HYACINTHS AND OTHER IMPORTED BULBS.

DAWE, COTTRELL, and BENHAM (Successors to Frederick Warner), Wholesale Seedsmen, have just received their annual importation of DUTCH and other BULBS in very fine condition. Catalogues on application.
3, Laurence Pountney Lane, and 36, Moorgate Street, London.
Established 1720 at 28, Cornhill.

GUERNSEY and BELLADONNA LILIES may now be had of Dawe, Cottrell, & Benham, 3, Laurence Pountney Lane, and 36, Moorgate Street, London.

FINE BLOOMING BULBS.

GUERNSEY and BELLADONNA LILIES, 4*s*. per doz.—Price to the Trade upon application to B. Page & Co., Oxford Street, Southampton.

IMPORTED DUTCH FLOWER ROOTS.

T. F. WINSTANLEY begs to announce that his Priced Catalogue of Dutch Bulbs for the present season will shortly be ready, and can be had free on application. It contains a list of all the newest and leading sorts in cultivation, including Hyacinths, Narcissus, Jonquils, Amaryllis, Early Single and Double Tulips, Crocus, &c., all of which have been grown by one of the first growers in Holland, and can be relied upon as being good sound Bulbs, and true to name.
28, Market Place, Manchester.

DUTCH BULBS AND FLOWER ROOTS.

THOMAS JACKSON and SON respectfully inform their patrons and the public that they have received in the finest condition their annual consignment of Bulbs and Roots, and that they are of the largest size and very finest quality. Good Double Hyacinths 4*s*. per dozen: mixed Polyanthus Narcissus, 3*s*. per dozen; Double Roman Narcissus, 4*s*. per dozen. Their Priced List of Bulbs, &c., and also their General Priced Catalogue of Stove, Orchidaceous, Greenhouse Plants, Ornamental Shrubs and Trees, and Herbaceous Plants may be obtained on application.—Nurseries, Kingston, Surrey.

CHOICE HYACINTHS, NARCISSUS, TULIPS, CROCUS, ETC. ETC.

JAMES CHARTRES and CO., Importers of Dutch Flower Roots, Seedsmen, &c., beg to announce that their unrivalled Stock of the above have arrived in splendid condition; the Roots are remarkably large and handsome.

J. C. & Co. earnestly solicit early orders to insure the finest Roots. A Catalogue may be had on application.

74, King William Street, City, and York Nursery, Hanger Lane, Stamford Hill, London.—Sept. 29.

SUPERIOR LETTUCE SEED.

WILLIAM TOOGOOD has now ready to offer to his friends his superior BROWN COS LETTUCE SEED, which he can recommend to be the best hardy winter Lettuce in cultivation. Per packet, 1*s*., free by post.
Westergate Nursery, Arundel.

W. TOWNSEND has now ready to send out GERANIUM CYDONIA CARMINEA—for description see Advertisement, 4th August; has been exhibited at the National Society, 15th June and 26th August, and obtained a Certificate. Plants 5*s*., 7*s*. 6*d*., and 10*s*. 6*d*. each: one over to every three ordered in the trade. Post-office orders payable at Bayswater.—Notting Hill.

VIOLETS.

R. SHACKELL begs to offer strong Plants of his superior Violet Russian Superb, at 4*s.* per dozen; strong plants of the Neapolitan Violet, now fit for potting, at 4*s.* per dozen; Double Perpetual Tree Violet, at 4*s.* per dozen; single sweet winter blooming White Violet, at 4*s.* per dozen; Double White do., 4*s.* per dozen; old Russian Violet, 10*s.* per 100 plants. hamper and package included for all orders above 10*s.*

R. S. would be happy to enter into arrangements with any retail Florist for supplying Bouquets of Violet blooms after the 1st of October until the 1st of March, provided the weather permit, at 5*s.* per 100. Bouquets almost to any extent.

Robert Shackell, Locksbrook Nursery, Bath.

GRAPE VINES FROM EYES IN POTS.

LUCOMBE, PINCE, and CO. beg respectfully to call attention to their remarkably fine stock of Grape Vines, raised from eyes, in pots, in a bearing state.

L., P., & Co. having two years ago erected a Vinery 90 feet long for the especial purpose of proving every good Vine in cultivation, are enabled to say that the Plants sent out by them are true to name.

LUCOMBE, PINCE, and CO.,
EXETER NURSERY,
EXETER.
Established 1720.

BASS AND BROWN'S
NEW AUTUMN CATALOGUES,

Comprising a considerable portion of descriptive and useful information, will be sent free by post complete for three penny stamps, and will be supplied gratis to our customers as usual. The articles will be found very select, and the best in cultivation.

NO. I. CATALOGUE CONTAINS:

BULBS & FLOWER ROOTS, comprising collections of the finest and most interesting bulbs in cultivation. The greenhouse varieties are distinguished from the hardy, and the colours and months of flowering are specified. A scale is also appended, giving the months best suited for planting.

HARDY HERBACEOUS PLANTS, with descriptions of heights, colours, and months of flowering, and embracing also our superb collections of Potentillas, Phlox, Penstemons, &c.

HOLLYHOCKS, the finest sorts, with full descriptions.

HELIANTHEMUMS, or Dwarf Rock Cistus, in 24 beautiful varieties.

SELECT and POPULAR TREES and SHRUBS, containing choice Collections of Coniferæ, Sikkim, and other Rhododendrons.

HARDY ORNAMENTAL CLIMBERS.

SELECT ROSES, with descriptions, and instructions for culture of each class.

FRUITS of the choicest sorts with select lists of each kind.

RHUBARB, Seakale, Asparagus, &c.

NO. II. CATALOGUE CONTAINS:

GERANIUMS, in divisions of Show, Fancy, French, Horseshoe Leaf, Scarlet, and other bedding varieties.

CINERARIAS, choicest varieties.

FUCHSIAS, best new of 1854.

AZALEA INDICA, including several beautiful new Continental and other varieties.

STOVE and GREENHOUSE PLANTS, &c. &c.

" Commander-in-Chief	3 6	" Wonderful	5 0	" King of Portugal	5 0
Lowe's Calliope	3 6	" Queen Eleanor	3 6	Hocken's Una	3 6

For varieties of previous years see Catalogue. Fine selections, 9*s.* to 18*s.* per dozen. Purchaser's selections, 12*s.* to 21*s.* per doz.

IMPORTED DUTCH HYACINTHS.

Our Dutch Roots have arrived in very fine condition. We beg to offer the following, of our own selection, in fine assortments, with printed instructions for their culture:—

50 Hyacinths in 50 choice sorts	30*s.*	Choice varieties, per dozen	6*s.*, 9*s.* & 15*s.*
25 ditto 25 ditto	16*s.*	Separate colours without name, per dozen	3*s.*

If required for Forcing we particularly recommend early planting. For our extensive Collection of Bulbs see Catalogue.

☞ *Goods Carriage Free (not under 20s.) to all the London Termini and free to all stations on the London and Norwich Line, viâ Colchester. Extra Plants gratis with orders of 40s. and upwards.*

BASS & BROWN, Seed & Horticultural Establishment, Sudbury, Suffolk.

HYACINTHS.

MESSRS. E. G. HENDERSON & SON

BEG to announce that they have now received their noted collection of HYACINTHS in excellent condition. They also beg to state, that having been for nearly 50 years the largest and most successful cultivators of this highly popular Flower in the vicinity of London, they can with confidence recommend the varieties named in their Catalogue as being the most suitable for pot or glass culture, and every way worthy the attention of Amateurs, &c.

Catalogues can be had on application, and for the assistance of those persons unacquainted with the culture of the Hyacinth, printed instructions will be given gratis with each order they are kindly favoured with.

CUCUMBER—HENDERSON'S "NAPOLEON III."

E. G. H. & Son have great pleasure in informing those who are fond of a really good Cucumber that they have succeeded in obtaining the stock of the above variety. It is one of the best for Winter culture and early forcing; is a free bearer and perfect in its form, possessing, indeed, all those qualifications of a good Cucumber which the most fastidious could desire. In packets, containing two seeds, 3*s.* each; ditto ditto, four seeds, 5*s.* 6*d.* each.

FLOWER SEEDS FOR AUTUMNAL SOWING.

Collections containing 12 distinct varieties, with printed instructions, 3*s.* 6*d.* each, postage free; ditto, 24, 6*s.*; 36, 8*s.* 6*d.*; 48, 10*s.* 6*d.*

CALCEOLARIA, CINERARIA, AND PRIMULA,

Saved from the choicest varieties, may be had in packets at 2*s.* 6*d.* and 5*s.* each; the finest quality of Calceolaria is only offered at 5*s.*; second quality, 2*s.* 6*d.* The finest fimbriated Primula in the country, 2*s.* 6*d.*

NEW PLANTS.

In the possession of E. G. Henderson & Son, and will be sent out for the first time in October. Full Descriptions of the following may be seen in the New Autumn Catalogue, just published.

Prices given on application.

A Catalogue is now ready, and may be had for two postage stamps.

The Nurseries are two miles from Godalming Station, South-Western Railway, where conveyances can always be obtained.

Milford Nurseries, near Godalming, Surrey.

JOHN WESTWOOD will be prepared on and after the 10th of October next to send out good well-rooted plants of the following novelties, at the very low prices undermentioned, viz.—

VERBENA "MRS. HALFORD."—The finest white yet raised; no other will be grown wherever it is introduced. Having had plants in his possession before any other florist, J. W. is now on hand many thousands, and is therefore enabled to offer them at 9*s.* per dozen, or 3*l.* per 100.

PETUNIA "MARQUISE DE LA FERTE."—A decided improvement on Shrubland Rose, and must entirely supersede it. The highest praise has been awarded this flower in the *Gardeners' Chronicle*, "The Cottage Gardener," and by all who have seen it. 8*s.* per dozen, or 2*l.* 15*s.* per 100.

All the White Corolla'd and other FUCHSIAS of 1855, by Chauviere, Epps, Henderson & Co., Lucombe & Co., and Smith, at 10*s.* per dozen.

The last new VERBENAS sent out by Chauviere, Smith, Turner, &c., many of which (especially those raised in France) are superior to the older varieties. 8*s.* per doz., or 2*l.* 15*s.* per 100.

Seedling Herbaceous CALCEOLARIAS from plants of a rare quality (superior to any exhibited during the past season), carefully impregnated by the Rev. E. Trimmer, who has latterly been remarkably successful with this flower. Best selection, 8*s.* per dozen, or 2*l.* 15*s.* per 100; 2d selection, 5*s.* per dozen, or 1*l.* 15*s.* per 100.

Seedling CINERARIAS from all the best named varieties, 4*s.* per dozen, or 1*l.* 10*s.* per 100.

Fimbriated PRIMULA SINENSIS, raised from plants inferior to none in the trade, of last year. 5*s.* per doz., or 1*l.* 15*s.* per 100.

J. W. has also for immediate sale Vines from Eyes of the best and leading sorts, at 24*s.* per dozen. And the true old Carnation Clove, at 5*s.* per dozen, or 1*l.* 18*s.* per 100.

The carriage will be paid to London; and where an order exceeds 2*l.* additional plants will be given in, and the hamper and package not charged for.

The Floral Nursery, Acton Road, Turnham Green

NEW STRAWBERRIES AT REDUCED PRICES.

GROWN AND OFFERED FOR SALE BY

WILLIAM J. NICHOLSON, Egglescliffe, near Yarm, Yorkshire.—The following splendid varieties have been well proved this season and given complete satisfaction, viz., Sir Harry (Underhill's), 100 plants, 4*l.*; 40, 1*l.* 18*s.*; and 20, 1*l.*; or 12*s.* 6*d.* per dozen. Omar Pacha (Ward's), 1*l.* per 100; 12*s.* per 50; 7*s.* per 25. Scarlet Nonpareil (Patterson's), 2*l.* per 100; 1*l.* per 50; 12*s.* per 25. Sir Charles Napier (Smith's), 1*l.* per 100; 12*s.* per 50; 7*s.* per 25. Admiral Dundas (Myatt's), 1*l.* per 100; 12*s.* per 50*s.*; 7*s.* per 25. Nicholson's Ajax, Ruby, Captain Cook and Fill-Basket, 6*s.* per 100; Ingram's Prince of Wales, Nimrod, Eliza (Rivers's), Surprise (Myatt's), and Bicton Pine, a large white one, 6*s.* per 100; British Queen, Black Prince, Eleanor (Myatt's), Old Pine, Trollope's Victoria. Goliah (Kitley's), Keens' Seedling, Old Roseberry, all at 4*s.* per 100: Crystal Palace, a very large and late variety, 10*s.* per 100. Post-office Orders payable at Yarm are expected with all orders. The plants will be securely packed and forwarded to any part of the kingdom.

MYATT'S ADMIRAL DUNDAS STRAWBERRY.—Strong plants packed and delivered free in London, 25*s.* per 100. Also MYATT'S British Queen, Cinquefolia, Globe, Eliza, Mammoth, 3*s.* 6*d.* per 100; Keens' Seedling, Hooper's Seedling, Black Prince, Bicton Pine, 3*s.* 6*d.* per 100.

MYATT'S BRITISH QUEEN.—In reply to several correspondents, and in confirmation of the private answers I gave last summer, I beg leave to state that the only Strawberry bearing the name of "British Queen" is MYATT'S, and when Mr. Beach, in his advertisement says "his true British Queen," he is obviously in error, and arrogates to himself the credit due to my late father, Mr. JOSEPH MYATT, who was the originator of the variety in question.—W. MYATT, Manor Farm, Deptford.—Sept. 29.

TO BE SOLD, a bargain, a fine lot of Specimen and other CAMELLIAS, beautifully set with bloom buds; several collections of choice show and fancy GERANIUMS of the most approved varieties; sets of all the NEW FUCHSIAS, with white corollas, &c.; about 700 VARIEGATED GERANIUMS, comprising Mountain of Light, Flower of the Day, and Osborn's Brilliant; and a quantity of large STOCK PLANTS of sorts, claiming the attention of all who are about to furnish or propagate. Also a large BOILER nearly new, capable of heating a spacious House, and a small ditto suitable for a range of Pits, &c.—The above may be seen, and the prices had by applying to JOHN SLIPPER, Villa Nursery, Camden Town.

RHODODENDRONS.

JOHN WATERER begs to announce that he is now prepared to execute orders for his two New Hardy Hybrid Rhododendrons, in good established plants, at 42*s.* each.

Rhododendron JOHN WATERER, colour glowing carmine, large truss, fine foliage, and a most abundant bloomer, in perfection about the 15th June.

Ditto, MRS. JOHN WATERER, a bright rosy crimson, fine conical truss, a very free blooming kind, in flower about 15th of June.

To the admirers of this justly noble class of Plants, JOHN WATERER has the pleasure of recommending the above as being the greatest acquisitions yet offered. They combine in a marked degree the necessary requisites for really first-rate hardy crimson varieties, viz., imposing colours, abundant bloomers, extreme hardiness, and flower at a time when they are not liable to be injured by spring frosts.

The American Nursery, Bagshot, Surrey, Sept. 29.

THE IMPROVED BROWICK RED AND OTHER SEED WHEAT.

WILLIAM BARNES, in returning thanks to his customers for SEED CORN, begs to offer this season the following sorts, which have been procured from the finest and best varieties, regardless of expense in the purchase and cost in the cultivation—viz., Improved Browick Red, Spalding's Red, Old Red or Lammas Wheat, White Chaff Red, and Bristol mixed with White, all of which he will warrant *true and clean.*

Mr. B. can recommend the Improved Browick Red with much confidence as being one of the greatest acquisitions in Red Wheat, for light or black land, yet offered to the farmer. In this locality (Deeping Fen) it was less injured by frosts and mildew than other Reds, and was pronounced by all who inspected it whilst standing over several acres to be unrivalled by any in the district.—For further particulars, address WILLIAM BARNES, the Elms Farm, near Spalding, Lincolnshire.

THE PAMPAS GRASS,

"GYNERIUM ARGENTEUM."

LUCOMBE, PINCE, AND Co. having now for sale the finest stock of flowering plants in this country of the above, are enabled to offer their well established plants to bloom this autumn at the following prices:—

Fine specimens with two flower stems ...	21*s.* 0*d.* each.
Ditto with one ditto	10*s.* 6*d.* "
Smaller plants to bloom next year	7*s.* 6*d.* "

L., P., & Co. have also healthy seedlings at 30*s.* per dozen, which will be ready in October, which, however, they deem it right to say will most probably not bloom for two years. To such parties as wish at once to see the plant in its beauty, L., P., & Co. would strongly recommend the larger sizes, as they are much better and cheaper.

Few plants are more ornamental than this Gigantic Grass, the leaves (which are more than 7 feet in length, curving gracefully outwards) grow in large tussocks, thereby producing a very fine effect, and from the midst of these numerous flower stems arise to the height of from 6 to 8 feet, surmounted by elegant panicles of inflorescence nearly 3 feet long, resembling beautiful waving plumes of silvery feathers. It is perfectly hardy, and is also easy of cultivation. A grand specimen of this noble plant is now in the Exeter Nursery, pushing up nearly twenty large flower stems and numerous small ones, and will continue to be an object of great attraction for a considerable time.

EXETER NURSERY, EXETER.
ESTABLISHED 1720.

CUCUMBER SEEDS FOR WINTER SOWING.—The three best and most certain varieties ever sent out, and such as are sure to give satisfaction for winter growing. General Canrobert, fine black spine, length 15 inches, 2*s.* 6*d.* per packet. Lord Kenyon's Favourite, length 12 inches, very handsome, free setter, and most prolific bearer, 2*s.* 6*d.* per packet. Gordon's White Spine, length 20 inches; this has proved to be the best long winter variety now in cultivation, 1*s.* 6*d.* per packet.

DIGITALIS, OR FOX-GLOVE SEED.

This beautiful hardy biennial has been so much improved within the last two or three years by continual hybridising, that the brilliancy of the colours, the numerous varieties into which it has sported, and the dwarfness of the plants, will cause it when once known to be planted in the largest and smallest of flower gardens, round the borders of shrubberies, and for making beds in large pleasure grounds where brilliancy and effect is required. They will grow well on rock-work or sloping banks, where numerous other varieties of plants will not thrive at all. The seed should be sown now in pans or boxes, and planted out early next spring; by so doing they will bloom well next season.

Sold in packets at 1*s.* 6*d.*, or double packets at 2*s.* 6*d.* Every order must be accompanied by Penny Postage Stamps, or Post Office Order payable to

EDWARD TILEY, NURSERYMAN, SEEDSMAN, & FLORIST,
14, Abbey Churchyard, Bath, Somerset.

NEW PANSIES.

DICKSON AND CO. are now prepared to offer the following NEW PANSIES, 5*s.* each, viz.:—

ADMIRAL NAPIER, yellow and rich maroon.
CYRUS, rich deep gold and crimson maroon.
INDIAN CHIEF, rich deep purple self.
MISS NIGHTINGALE, white and deep purple.
PRINCESS, white and bluish purple.
RUBENS, yellow and fine rosy purple.

Usual discount to the trade.

Waterloo Place, Edinburgh, September 29.

ROSES.

S. PONSFORD, NURSERYMAN, SEEDSMAN, AND FLORIST, begs to say that his fine collection of ROSES is now in the beauty of the Autumn blooming, open to visitors every day (Sunday excepted). The Stock comprises everything good and useful. To Gentlemen anticipating planting in the coming season, S. P. can offer his general Nursery Stock with perfect confidence, not only containing everything in general demand, but unusually good in condition, and as low in price as any honest tradesman can render. New ground work executed to any extent.

Loughborough Park Nursery, Cold Harbour Lane, Brixton.

N.B.—A Descriptive Catalogue forwarded on the receipt of two postage stamps.

GEORGE JACKMAN begs to state his PRICED CATALOGUE of choice CONIFERA, HARDY EVERGREENS and ORNAMENTAL TREES, which are well grown, and constantly removed; also Roses, Standard, Dwarf, and dwarf-trained Fruit Trees, and Forest Trees, can be had on application by enclosing one Postage Stamp.

G. J. respectfully invites persons planting to pay a visit to his extensive nursery, one and a half mile from Woking Station, South Western Railway, where all trains stop, and conveyances can be had.—Woking Nursery, Woking, Surrey.

E. R. GREENUS, from his PROXIMITY to the Watford Station (London and North-Western Railway), begs to say that he can execute all orders with the UTMOST DESPATCH. His Stock (being FINE this season) of FRUIT TREES, Trained and Untrained; STANDARD and DWARF ROSES of the best sorts; well grown FLOWERING SHRUBS, EVERGREENS, FOREST TREES, AMERICAN PLANTS, and NURSERY STOCK in general, all which, from FREQUENT TRANSPLANTING, can be removed with perfect safety and success. Carriage paid to London on all orders above 2*l.* Garden and Agricultural Seeds supplied.—Railway Nurseries, Watford and Rickmansworth.

DUTCH HYACINTHS for Blooming in the Drawing-room, Parlour, &c., through the winter months.—We, the undersigned, beg respectfully to intimate we have imported from the best growers in Holland a very superior and large Assortment of Choice DOUBLE and SINGLE HYACINTHS, suitable for immediate cultivation, and which we can warrant as being first-rate kinds, and sure to give satisfaction.

The best Hyacinths, to bloom in water, per doz. ...	8*s.* 0*d.*
Very good varieties, ditto ditto, per doz....	6 0
Best mixed Crocuses, for pots or borders, per 100 ...	1 6
Polyanthus Narcissus, for pots, very fragrant, per doz.	3 0
Van Thol Tulips (these will bloom in pots by Christmas, if planted now), per doz	1 0

With every other kind of Choice Dutch Bulbs, a Catalogue of which will be forwarded on application (free).

CLARKE & COMPANY, Wholesale and Retail SEEDSMEN and FLORISTS, 86, High Street, Borough, London, about 30 doors from the London Bridge Railway Termini.

N.B.—A Choice Parcel of Guernsey Lilies, just coming into flower, 6*d.* each.

MAGNIFICENT SPECIMENS OF CONIFERÆ.

LUCOMBE, PINCE, AND CO. respectfully call attention to their very superior specimens of the above, which are worthy of the notice of all who are engaged in ornamental planting, their growth and shape being perfect, and their roots all that can be desired, so that where immediate striking effect, combined with perfect safety of removal to any distance is required, these large symmetrically grown and well managed plants can with confidence be recommended.

Abies Douglasi	Pinus insignis
" orientalis	" Cembra
" Menziesi	" austriaca

Henfreya scandens ...	1	0	" rosea...	1	0
Hexacentris lutea... ...	1	0			

Also strong plants of the following CHRYSANTHEMUMS, which are the best of last year:—Annie Henderson, Arigenia, Augustine Mie, Aurore Boreale, Bob, Brilliant, Comte Achille Vigier, Docteur Bois Duval, Eclipse, Hermine, Le Prophète, Louis Delaborde, Madame Passy, Marguerite de Valois, Marguerite de Wildemer, Pluie d'Or, Prince Jerome, Requiqui, Turris Eburnea, Zebra, at 8*s.* per doz., or the collection for 10*s.*

F. G.'s priced Catalogue of Dutch Bulbous roots is now ready, and may be had free on application. Remittances expected from unknown correspondents.

Broadfield Nurseries, Sheffield, Sept. 29.

AZALEAS AND ERICAS.

W. J. EPPS has much pleasure in offering the following fine, bushy, well-grown plants, and of the choicest and best varieties, in large 48 and 32-size pots.

AZALEAS 18*s.* per dozen; 5*l.* per 100.
ERICAS 12*s.* and 18*s.* per dozen; 4*l.* and 5*l.* per 100.

These will make very pretty specimens for the ensuing season; all orders to be accompanied with a remittance from unknown correspondents.—Maidstone, Sept. 29.

NEW PELARGONIUMS.

GEORGE SMITH has a fine Stock of the following first class PELARGONIUMS in strong Plants, at from 30*s.* to 40*s.* per dozen, according to the sizes of Plants, hamper included with Plants to compensate for carriage:—(Forster's), Jessica, Phaeton, Seraskier; (Hoyle's), Hubert, Lord Raglan, Omar Pasha, Serena, Topsy, Wonderful, Yerda, Zoe; (Beck's), Conqueror, Dido, Fidelia, Laura, Lydia, Silenus; (Turner's), Grand Sultan, Pandora; (Forquett's) Petruchio; (Story's), Fair Ellen, Snowflake; (Horken) Una; (Cant's) Vespa; (Dobson's), Commander-in-Chief; (Fuller's) Gem of the West. With a choice assortment of show and fancy kinds. A descriptive Catalogue on application. Unknown correspondents forwarding a remittance with their orders will be liberally dealt with. Post-office orders payable at Islington.

Tollington Nursery, Hornsey Road, Islington, London.

VEREA CRENATA (*Syn.* KALANCHOE VARIANS), —THE LEAF OF LIFE *Nat. Ord.* CRASSULACEÆ.—A small importation has lately been made of the leaves of this interesting botanical curiosity, which matures plants in the serrations of its leaves.—Leaves on sale at 2*s.* 6*d.* each, post free, at GEORGE ROBERTS, 32, Moorgate Street, London, where a drawing of the plant in flower may be seen. Further described in reply to letters.

CATTELL'S EARLY BARNES CABBAGE; DO. DO. RELIANCE; ALSO PARAGON, IMPERIAL, KING, NONPAREIL, ETC.

JOHN CATTELL has now ready Bedded Plants of the above, at 5*s.* 6*d.* per 1000. No charge for crates, baskets, or packing. Packages of 5000 or more are delivered to London and to the Edenbridge Station of the South-Eastern Railway carriage free. A remittance or reference to accompany orders from unknown correspondents.—Nurseries, Westerham, Kent.

NEW STRAWBERRY.

KITLEY'S CAROLINA SUPERBA, not surpassed in flavour, habit, and productiveness by any Strawberry extant, at the low price of 2*l.* per 100, 9*s.* per doz., free by post, to be had of Messrs. GARRAWAY, MAYES, & Co., Bristol, agents for the west of England and South Wales, or of any respectable nurseryman. For a full description, testimonials, &c., see this Paper, April 14, 1855.

JAMES KITLEY, Lyncombe Vale Nursery, Bath.

AGRICULTURAL SEEDS, ETC.

PETER LAWSON AND SON, SEEDSMEN AND NURSERYMEN TO HER MAJESTY THE QUEEN, and THE HIGHLAND AND AGRICULTURAL SOCIETY OF SCOTLAND, are now supplying the following seeds of the best quality:—

Italian Rye-Grass, Foreign seed	Dwarf Essex Rape
Crimson Clover (Trifolium incarnatum)	Winter Tares
Alsike Clover (Trifolium hybridum)	Natural Grass Seeds, for Pastures and Lawns, &c. &c. &c.

27, Great George Street, Westminster.

The Gardeners' Chronicle.

SATURDAY, SEPTEMBER 29, 1855.

ST. JAMES'S PARK is to be destroyed; if we are to believe some of our contemporaries who are in distress at the dearth of good subjects of complaint. Those beautiful grounds are to be desecrated, the rights of the people are to be violated, and the poor are to be ousted from their verdant patrimony, and deprived of their holiday recreation, in order to gratify the bad taste, or to satisfy the greediness of some of the hangers-on about public offices. This would be indeed a grievance if it were true: and an unlimited amount of popular capital might, we have no doubt, be raised upon the strength of it.

But is it true? Does all the clamour about desecration, and violated rights, and official wrong-headedness or something worse, stand upon any sort of foundation? Certainly not; that we undertake to affirm of our own knowledge.

It seems that the Home Secretary is of opinion that it would be a great public convenience if a way for carriages and foot passengers could be carried in a direct line from St. James's Street to Westminster, so as to escape the long circuit by Whitehall on the one hand, and by Pimlico on the other, and to relieve the crowded thoroughfares of some portion of their excessive traffic. Can we doubt that this would be an immense public convenience? if any one does, we beg he will find his way from Bond Street to the Houses of Parliament, and then compare the distance as the streets now run with what it would be if the proposed way were made.

But no such way can be made without crossing St. James's Park and the beautiful piece of water there. And herein lies the offence. To cut St. James's Park in two by a dirty road, and thus to reduce one beautiful garden to a couple of unconnected ugly spaces; to throw a hideous bridge across the only ornamental piece of water in our metropolitan parks; to show such a total disregard of public convenience; and to rob the lower classes of such an enormous piece of ground as the road would occupy is a design of unparalleled official despotism. Such, we believe, is the essential part of the allegations made upon this occasion.

We have, however, wholly failed to discover the inconveniences which are painted of such portentous dimensions. We are unable to understand why, in order to make the way proposed, the Park should be cut in two as is pretended, or the beauty of the

water be destroyed, or the recreation of the public be interfered with. One would think that the intention of Government was to construct a massive military road, paved with granite and traversed by incessant artillery waggons; or to form a causeway over which stone was to be conveyed on its way from Paddington for the construction of the new bridge at Westminster and the Houses of Parliament. On the contrary, the bridge is to be of the lightest design, to be used merely by foot passengers, horsemen and carriages; and instead of cutting the Park in two it will consist of arches thrown over the greensward, as the bridge itself will be over the water. So that as free a communication as now exists will be maintained between the two sides; nor will any real space now available by the public be lost, for the roadway itself, while on the level, will stand in the place of so much shrubbery, which must always be protected ground.

With respect to the badness of the effect to be produced by the intended alteration, much will of course depend upon the design for the bridge, concerning which there is at present no public information. It is however an admitted principle in landscape gardening that the effect of water is greatly improved whenever it is spanned by a bridge.

"There is one class of buildings," says Sir Uvedale Price, "of a very distinct character from any of those already mentioned, which by no means deserves to remain unnoticed—that of bridges. In every style of scenery they are objects of the most interesting kind; whether we consider their great and obvious utility, and the almost intrinsic beauty of their forms, or their connection with the most pleasing scenes in nature, and the charms which they add to water, and receive from it in return."—And again: "The situation of a bridge most commonly confers on it such distinction that it wants no ornaments to mark it, and to detach it from other objects; then the arches themselves form such grand and beautiful openings, that they require no artificial breaks or embellishments to disguise or adorn them, for their natural arrangement is as simple and beautiful as their form; whereas, in some of the necessary apertures in other buildings, such as the windows in houses, there is nothing of intrinsic beauty or grandeur; and in their arrangement the architect is frequently embarrassed how to make beauty accord with convenience."

Such were the opinions of one of the greatest landscape gardeners, and we are not prepared to believe that St. James's Park will offer an exception to what Price regarded as a universal rule. On the contrary, looking at the water itself, and the place where it is proposed to span it with a bridge, we are persuaded that when the alteration is made the most vehement of those who now oppose it will feel that he was in the wrong.

It is rightly urged that the Parks are places set apart for public recreation and public convenience. In the present instance the former can, in no degree whatever, be interfered with; on the contrary, if beautifying a place of public resort renders it more enjoyable, the pleasure of the frequenters will have been consulted, not neglected. As to convenience, one of its first conditions in a great city is freedom of communication; and it is impossible to say with any justice, that the public interest is neglected by forming a roadway between two of the most crowded districts of this huge metropolis. If the way in question does nothing for Belgravia, it does everything for Brookes' and White's, the line from St. James's Palace to the Regent's Park and the great region of Marylebone. So far from objecting to roads formed through the Parks we hope to see more; one for instance from Charing Cross through Spring Gardens, and another from Tyburnia towards Kensington Gore. They are of urgent necessity and it is a strange perversion of language to hold that the public is wronged by measures in which nothing is so much consulted as public convenience.

Let the Board of Works persevere; the recent outcry will have died away before a sod is turned; and if not let them recollect that "public opinion" is not exclusively represented by the ready writers of a few popular newspapers.

There is no satisfying some people. Their vanity is inordinate; and praise they regard as scanty courtesy unless it is carried beyond all truth and moderation. It is not enough to say "you have done well and been useful;" they expect to be told that their merit transcends that of all men, and to be regarded as benefactors of the human race. A notable example of this has just occurred at the meeting of the British Association at Glasgow. Mr. N. B. Ward, after whom the well-known Wardian case has been named, has laid his sorrows before that learned body. He conceives himself ill treated by the Editor of the *Gardeners' Chronicle* because the results of his wonderful discovery that a Fern-seed will grow in a glass bottle is not placed on the same level as the inferences to which the fall of an Apple once led. That we should not have recognised a second Newton in Mr. N. B. Ward is a grave offence.

Accordingly the learned gentleman has complained to the British Association, as we have already said. He assured his hearers that "the statements of the editor of the *Gardeners' Chronicle* were unphilosophical and *untrue*"; meaning, as he tells us in a private letter of apology for the use of such language, that he only questioned the accuracy of our conclusions, and not of our statements. One of the statements to which he referred was, as we understand him, that plants will not *grow* in a Wardian case; and he remarks that it does not appear that we "have instituted a single experiment to test the value of that hypothesis." We should wonder if we had. It was not necessary to prove experimentally the soundness of an opinion we never expressed.

The article which has so grievously disturbed the equanimity of our worthy friend is we presume one published in our volume for 1854. p. 252. In this occur the following sentences:—"rightly used and correctly understood it is an excellent adjunct to horticulture."——"when properly constructed the Wardian case answers perfectly as a means of transplanting plants to great distances."——"It has also its value in places where the air is filled with floating soot or dust; or where it is naturally too dry for vegetation, as sitting-rooms. There the lives of certain kinds of plants may be maintained *for long periods of time* with the appearance of health; shade-loving races such as Ferns and Mosses *will even thrive there;* and others, like dry Crocuses and Hyacinths, *which have been previously made ready by the usual processes,* may be led *to blossom in perfection for a season,* or in some instances for more."

Does the learned gentleman mean to say that these statements are "unphilosophical and untrue"? We know them to be true, and we should have thought them laudatory enough for any moderate appetite. Nor can we see in what respect the testimonials produced by Mr. Ward himself in favour of his invention go beyond our own.

If he means to say that we are wrong in condemning Wardian cases as places where *good cultivation* is to be carried on, then we have merely to repeat the observations formerly made at pages 252 and 317 of our volume for 1854, and more recently in the Theory and Practice of Horticulture. We then objected to the principle on which these contrivances are constructed, and we appeal, in support of that opinion, to every gardener who has tried them rationally. Mr. Ward is much mistaken in supposing that we say this in the absence of experimental proof. We might point to the common notoriety of the case if it were necessary. But it so happens that we have used Wardian boxes for years experimentally both in London and the country, in the exact form proposed by their author as well as in a modified state; and the result is invariably consistent with everything that is said in the preceding quotations and with all that was further urged in the two articles to which we have also referred.

We can easily believe that gentlemen whose gardening is limited to a glass box in a London window may be proud of the success they achieve. We have no doubt that Dr. Alfred Smee has made Stanhopeas and other Orchids blossom in such a place, and that Dr. Young, of Kennington, has grown Ferns in them and also "kept other plants alive," although he finds, as he honestly admits, that their "utility is still in its infancy." But this is not gardening any more than growing Wheat in a flower-pot is farming; nor are either Mr. Ward or his witnesses gardeners. They are gentlemen who amuse themselves with a very agreeable and interesting toy, whether it really be "a Wardian," properly so called, or merely a portable greenhouse, as is frequently the case.

Upon this point we must again observe that a "Wardian," properly so called, is a close box with glass sides; and that when it is opened and shut from day to day, it has no more right to the name than a common greenhouse. If the former is not what Mr. Ward claims credit for, then he cannot claim it at all. He started from glass bottles containing moist earth and *carefully closed* with a lid or with oiled silk; and such must continue to be the condition of his case, be its materials or its magnitude what they may.

We should not have again referred to this subject, had we no other object than to defend ourselves from a feeble attack, which must have amused more than edified the Botanical section. But in reality, one of the greatest of Horticultural questions is involved in the discussion; and if we were to acquiesce in the justice of Mr. Ward's opinions, we should be helping to throw back the art of gardening to what it was in the days of the Arrons and Andersons. All modern experience shows that healthy vegetation, productiveness, brilliancy of colour, and richness of flower among plants is in direct proportion to the free circulation of air at a fitting temperature, and in a due state of humidity. Mr. Ward thinks the reverse to be true, and that plants like to find themselves permanently in "quiet media;" that is to say, in places where plants "spindle" and "fog off," and "blight" and "mildew," to use our homely horticultural language. When he can find a gardener of experience to support such a view it will be time enough for us to examine it more formally. Till then we must continue to warn those who would cultivate plants well to beware of Wardian cases. Where plants are to be grown under difficulties, as in sitting-rooms, or sooty neighbourhoods, they may be advantageously employed, as we have never hesitated to assert; but even there the less the true Wardian principle is observed the better for their inmates.

New Plants.

— 145. Abies Kæmpferi.

At p. 255 of our volume for 1854 we gave an account of this fine tree; we are now enabled by the kindness of Mr. Glendinning, of the Chiswick Nursery, who possesses a small number of plants, to add the following sketch of its appearance, reduced from a Chinese drawing sent home by Mr. Fortune. The

figure of a man at the foot of the trunk will show what the size was of the specimen seen by Mr. Fortune's draughtsman.

—VEGETABLE PATHOLOGY.—No. LXXXIX.

366. Carcinodes.—(*Canker.*)—In the last number a peculiar case of canker in Apple trees was described; there is, however, another far more common and with the exception perhaps of the woolly aphis by which it is often accompanied, the most formidable malady to which they are subject. Some varieties, as the Golden Pippin, are so easily affected, that they are very difficult of cultivation, and indeed will not succeed at all except in favourable localities. The original evil consists in some constitutional depravity, which becomes manifest at once whenever there is any pressure of outward circumstances.

367. I have now before me some dead branches of a Golden Pippin, which in the living portions is still strong enough to bear very fine fruit, though the tree is evidently fast approaching the end of its existence. The fruit appears on two kinds of branches, equally fertile, the one tall spiry twigs which have grown with great rapidity, the other stunted more or less divaricate branchlets, whose progress has been extremely slow. Both are equally affected by canker, though not, to the outward eye at least, exactly in the same way; the free growing branches apparently perishing downwards and casting their thin bark, while the others perish first at the base, in consequence of which the parts above are deprived of nutriment and fail. On closer inspection, however, the difference is only apparent, for even the smooth twigs will be found to have scattered spots at which decay has taken place involving the superior organs. If a cankered

branch be examined as soon as the mischief is visible, a vertical section through the pith will generally reveal the point from whence decay has commenced, which is usually some bud, and most frequently a flower-bud. The flowers in the first instance may not have set, possibly from some innate weakness in the bud, without any external cause; or some of the circumstances which usually produce sterility, whether in an earlier or later stage of growth, before or after impregnation, may have operated, but the effect is the same. The footstalks may separate from their point of attachment leaving the bud, which was already in a weak condition, in a state unfit for further vegetation and the development of one or more axillary buds in order to the formation of a new fruit bud, or the young fruit may still remain, withering on its matrix, which has not vitality enough to throw it off. Either the matrix itself immediately, or the dry fruit remaining *in situ*, decomposes as the season advances, the morbid matter is carried down to the tissue surrounding the pith, and if the branch has strength enough to resist the infecting matter, though the bud itself decays to the base, it is soon covered over with fresh layers of wood, and no permanent injury is caused; if, on the contrary, the constitution be weak and the vitality low, the woody tissue perishes all round, and soon involves the bark which covers it, so that both are incapable of transmitting the nutritive fluids, and the branch which was just before apparently free from diseases perishes as if by a flash of lightning. The bark immediately in contact with the diseased wood soon perishes and often disappears, while that of the upper portion which perished merely from the cutting off of its supplies of sap affords a fit nidus for fungi, which soon complete the destruction, and sometimes bear that blame which belongs to totally different circumstances. All this may be complicated with the woolly aphis and such cases of canker as that described in our last article, so that the tree in every part presents a gnarled and warty aspect. Many varieties of Pear are equally subject to canker, and the phenomena in their case are nearly the same, except perhaps that the cankered spot is more apt to be gouty.

368. Where there is a great weakness of constitution it is obviously very difficult to contend against such circumstances. Something, however, may be done by very careful inspection of trees, and the removal of every spur which does not appear healthy. The bark will often close rapidly over a clean section, where it would be made unhealthy by the contact of a decaying twig, and though the tissue of the wood may be slightly affected, if the source of infection be removed, the surrounding tissues may remain healthy and the tree be preserved.

369. Gumming is in many cases merely a form of canker, the exudation of the gum aggravating the condition, and making the wound extremely difficult to heal. *M. J. B.*

PROPOSED NEW ROAD THROUGH ST. JAMES'S PARK.

As your paper has ever been the organ of plain, useful sense, uncontaminated by personal malice or party feuds, I hope you will not object to insert a few lines from an impartial observer on the uproar recently raised against the proposed new road through St. James's Park. For myself I am neither an inhabitant of Belgravia nor St. James's. It is nothing to me whether Westminster or Lambeth, Mayfair or Marylebone are accommodated; but "fair play" is the motto of an Englishman, and therefore it is well to look at the source whence all this clatter proceeds. "Oh!" says Mr. Johnson to Mr. Smith, "It is the public voice. The public is aggrieved, the public will have its own way—the *Times* says so." Let us try to examine, for one moment, what is "the *Times*." "Is it a man?" "No. It's many men." "What! the men that make the public?" "By no means—the public knows nothing about them." "Who are they?" "Nobody knows." "Why do they write articles about the public?" "Because they are well paid." "Who pays them?" "Nobody knows." "Why do they not put their names to their articles?" "Because if they did, nobody would believe they were the confidants of the public—and the public, which is to be played upon, would not respond." Now, this late cannonade is something like a pop-gun loaded with peas discharged at a timorous female in the dark. The nerves are so tremulous that the understanding goes for nothing; she believes that each cold pea is a red-hot bullet; and not only that murder is intended, but that it is actually committed, and that she is bleeding to death! The *Times* loads pop-guns, rightly judging that it can frighten the public, and make it believe that St. James's Park is already nearly destroyed, that "by reason plain" the public health is gone, and that its destruction has been perpetrated in cold blood by the Chief Commissioner of Works. Has the public forgotten who that individual is? Has it forgotten that this is the very man who was President of the Board of Health—the very man who risked his life this very time 12 months for the preservation of this same public?—the man to whom we are indebted for the enormous reforms which his colossal mind and wonderful powers of application have brought to bear, and carried through the House of Commons this very year? This same public, to which the *Times* is apparently so much attached, heard very little through its columns last September of the then President of the Board of Health when he went into the infested regions of London, to see, to console, support, and direct this said "public," while 60 or 80 corpses lay dead in one place, and the survivors were nearly paralysed by terror and grief. What said the *Times* then? Neither cannons nor pop-guns were loaded for its beloved public; and had the President of the Board of Health (the M.P. for Marylebone) depended on its pages for encouragement, very little, indeed, would he have done for the benefit of that public who lay dying and dead around him! The arrestation of the cholera, and the present exemption from the pestilence may be considered much owing to that same man's ability and indefatigable exertions to make effectual laws, to carry out measures for its arrestation and future prevention or mitigation. The public would do well to look to antecedents, and then judge whether the *Times* or the present Chief Commissioner of Works has proved the most faithful friend and trustworthy guide on former occasions. The *Times* has truly distinguished itself by abuse of Lord Raglan till he died, and then it changed its opinion; also by similar uncomplimentary predictions against the present Ministry, till one day when Sebastopol was taken! Now new excitement is wanted—new grievances must be manufactured at any price to keep the people amused till Parliament meets—and what can be so sweet an employment as to pull the present Chief Commissioner of Works to pieces, because he does not belong to the "sleeping family" of some of his predecessors, who happen to be special favourites with a minority of persons in printing offices. It is greatly to be desired that the much-quoted public of the *Times* would examine the style of writing of recent attacks in that paper, as they appear to be all variations played by the same hand; whether articles or letters, the motive seems to be very foreign to the apparent subject, while the variations run wide of the original theme. It is much to be regreted that the individuals who have so carefully performed in the same style (which cannot fairly be considered that of "modern improvement") should be so modest as not to record their names, which, if as yet unknown to fame, might henceforward become celebrated for logic and for eloquence; and it is hoped that in the next editions future variations to the tune of "Dear public, what will become of thee?" will be signed by some one of the many Jacks, or victorious holders-on, whose talents find such liberal encouragement in the *Times*, and whose leisure hours assist in this dull interval to fill up vacuums in the *Daily News* and the *Sun*.

I hope you will not consider that these few words upon the real value of such sort of *attacks* are misplaced in the *Gardeners' Chronicle*; it is my sincere wish that the valued public (not the "public" of the *Times* but the reality claiming that name) may be permitted by that literary luminary to make use of its own memory and understanding. *John Field, Rose Cottage, Fulham.*

NOTES ON TRANSPLANTING.—No. IV.

In planting to a limited extent, as in removing a few favourite or valuable specimens, many resources are available to ensure success, which could hardly be employed largely. Thus should the weather be dry after planting, the branches may be occasionally syringed or protected from the action of the sun by a screen of canvas or mats, or better still both the syringe and the covering may be used together. The practice of syringing newly-planted shrubs cannot be too much praised, many a valuable plant has been preserved by it. If the leaves and succulent shoots of plants give off a large amount of water by evaporation, they also take in a good deal by absorption. The leaves, branches, and stems of a new-planted tree or shrub, should, if possible, and especially if removed in spring, be kept moist till the production of new roots renders such assistance unnecessary.

When it is determined a year or two beforehand to remove a large plant which it is worth while to ease, it is a good practice to cut a trench at a distance from the stem proportionate to its size, severing all the roots and filling in the trench with a light mould, in which rotten leaves form a large portion. This favours the production of fibrous roots, and enables the plant to be removed with a fair chance of success. If the plant is very large and its roots extend a long distance from the stem, the operation of root cutting had better be extended to two seasons, cutting half in each. If all are cut through at once the check would probably be too great, and endanger the life of the individual. Many large rough shrubs may be safely transplanted so as to be very useful afterwards, by cutting off all their branches, pollarding them in fact, and taking them up with as much root as can be conveniently secured without attempting to secure a ball. Such will generally succeed, and make luxuriant growths the second if not the first season after planting. Where appearance is of no consequence for a year or so this mode of planting may be very usefully employed.

In reading what I have so far written, it seems to me that enough has not been said on the importance of draining as a preliminary to planting where the soil is a retentive one, and the subsoil unfavourable for the passage of water. As example is said to be better than precept, I will give one illustration of the position. The inferences to be drawn from it will be of more practical value than anything I can urge by way of theory in the absence of some such illustration. An estate which had long been in the possession of a gentleman who cared little for improvement, fell into other hands, and extensive alterations were immediately commenced. Near the mansion were several large shrubberies, or what had been intended for shrubberies, which, as I learned from a person who had long resided on the estate, had existed for several years, but in consequence of the poor, stiff, wet soil, the plants would not flourish; nevertheless the vacancies from deaths had been made good every year, with the hope that some would at last succeed. The appearance of the then existing shrubs and trees was sad indeed. The trees were of the ordinary deciduous kinds; the shrubs common and Portugal Laurels, with here and there a Holly or an Arbutus. Very few had made any growth since they were planted; the Evergreens wore a yellow sickly hue; the deciduous trees were covered with Lichens, a great portion of their branches were dead or dying, and, as I before observed, this state of things had existed for some years. In the course of the alterations these plantations were swept away, a few of the shrubs being retained to be planted again subsequently. The grounds, prior to a new arrangement, were thoroughly drained, and spaces for the shrubberies deeply trenched. Many of these embraced portions of the ground where the old shrubberies had been, and in planting the new ones some of the shrubs which had been retained were placed in nearly their old positions. The sequel may be imagined. The draining and preparation of the soil acted like enchantment. The first season the plants merely established themselves, much growth could hardly be expected; but in the succeeding year the value of the treatment they had received became apparent enough. Dark green foliage and strong healthy shoots were everywhere conspicuous; and what a dozen years of previous labour had failed to produce, was obtained by well directed expense in two years. Before the ground was prepared under the new proprietor, rain which fell in the autumn and winter collected in pools on the surface, and did not disappear till it was evaporated in the spring. The roots of the plants were in water six months out of the twelve. Death was of course the rule; few trees beside a Willow or an Alder could exist there for any time. Thorough draining with subsequent cultivation of the soil, however, changed the whole aspect of the grounds, and rendered the soil as healthy and as well suited for the growth of all ordinary trees as could be desired.

There is one other important matter in reference to planting which I must not pass over—I allude to what is called cheap plants, or in other words when, from an idea that he is procuring a bargain, a gentleman purchases a quantity of coarse-rooted stunted plants considerably below the fair market price demanded for good ones, and cheats himself into the belief that he has made a bargain. The amount paid for these so-called bargains is generally so much money thrown away. The failures are so numerous that the greater part of the plants have to be made good in the following year—both time and money are thrown away, and the work has to be done over again. To speak somewhat paradoxically, but nevertheless truly, cheap plants are in nine cases out of ten very dear ones. The same expense for labour in the planting is incurred, and all attendant charges, with the exception of the actual purchase money, are the same for good as for bad plants. And the difference between the price of a good article and a bad one is in reality very small, and bears no sort of proportion to the importance of the results involved. But there is a talismanic charm about the word cheapness, and we are all more or less affected by it, which too often, like a veritable Will-o'-the-Wisp, is a delusion and a snare. If you have a shrubbery to plant and intend purchasing the materials for it, determine to give a fair market price, and insist upon being supplied with the best article of the kinds you require. Give your order to a respectable tradesman on these conditions, and you will have no reason to complain. But bear in mind what has been said before about the treatment of the plants when you get them.

There are, especially in the neighbourhood of London, frequent sales by auction of nursery stock. They are held for the express purpose of clearing off quantities of inferior plants such as nurserymen are glad to get rid of at any price. Nevertheless purchasers are always found, and it is not till a few months afterwards that they are fully awake to the almost worthlessness of the goods purchased. For those who chiefly patronise these sales are but little acquainted with plants, and are induced to become purchasers mainly in consequence of the apparent cheapness of the lots. These sales are a fertile source of disappointment in planting, and those who may contemplate attending them to make purchases, will do well to be wary, or still better avoid them altogether; and, in fact, unless they have a good knowledge of plants themselves, or can take the advice of some one who has, will be much the gainers by rigorously avoiding what are called "bargains" in plants under any circumstances.

To recapitulate, plant in the autumn if possible, and always prepare the ground well beforehand. If compelled to carry on the work in spring, great care will always be required; and unless the weather is very moist, and other circumstances favourable, the month of March should be avoided altogether. In limited operations great license may be taken with established rules; and in those of great extent, local or peculiar circumstances may warrant a wide deviation from the dictates of general principles.

In conclusion, a word or two on planting by contract. Do not choose an estimate solely because it is a low one Recollect that any nurseryman can supply plants of the

same kinds at a variety of prices, and that if you insist upon having your work done at a cheap rate, you must not expect to receive the best plants either in quality or sorts. It is one thing to have your beds filled with stunted shrubs and deformed trees, and these of the commonest sorts too; and another to get healthy and luxuriant plants of the best kinds for the purposes required, and which will be every day growing into beauty and usefulness. A few pounds more or less in the original cost will decide in favour of either. *George W. Lovell, Landscape Gardener, Bagshot.*

Home Correspondence.

Professor Henslow's Horticultural Show at Hitcham, Suffolk, Sept. 19.—This interesting rural fête, the second of the season, was favoured by a lovely day, and was rendered unusually gay and animated by the many coloured decorations of the flags of all nations which floated over the happy scene of mingled pleasure and instruction. Over the front door of the rectory were the words "Seed time and harvest fulfilling God's word," in letters formed of Laurel leaves and flowers, most appropriately reminding the visitor of the gratitude due to the great Giver of all for the bounty of the season. Under the array of flags waving over the lawn were two tents, in the larger of which the specimens of allotment produce were set out, and their excellence proved how great a benefit a quarter of an acre well cultivated may become to a poor man. The smaller tent had inscribed on it in letters formed of snail shells, surrounded by muscle shells, "Marquee Museum." In it was an instructive collection of various objects —animal, vegetable and mineral, and miscellaneous. In the part allotted to the animal kingdom were an armadillo, a hedgehog, a porcupine, the skull of a tiger, and Patterson's zoological diagrams, besides birds, reptiles, molluscs, and insects. The principal vegetable specimens were limited to Gutta-percha, including a drawing of the tree, and illustrations of the modes of preparing the Gum-resin in all its actual forms. These included blocks as imported, sliced, teased, kneaded, rolled into sheets and tissue, cut into strips, moulded, tubed, applied to electric-wire coating, and manufactured into various articles. Amongt the mineral matters the most attractive were 22 dozen fossil whales' ear bones from the so-called coprolite pits of Suffolk, thousands of which have been found within the last 10 years. In the list of miscellanies were antiquities, Russian trophies from the Crimea, manufactures, and models. The cottagers and the ladies and gentlemen present mingled together in this museum, where the Professor most agreeably and plainly explained to all inquirers whatever was desired. About 3 o'clock he ascended a rostrum decorated with evergreens and flowers, to deliver what he called "lecturets" on the objects in the Marquee Museum, dilating on Wheat and one of its diseases, bunt, the remedy for which was good dressing, and explaining the discovery, nature, and application to the arts of Gutta-percha. The lecturets concluded, he commenced the allotment report, and announced the prizes. The three first prize-men and one first prize-woman had framed testimonials for superior allotment cultivation. Their names and nature of the prizes were surrounded by painted wreaths of flowers, and would become the perpetual ornament of their cottage walls. After this came the school report and distribution of prize certificates, connected with excellent advice both to parents and children. Alluding to the teachers he observed, "there is a way of doing all this earnestly, and yet with pleasure both to child and instructor if the teacher has his soul in the work, and feels that it is a work for God." England has at this time many such teachers of all classes. Tea "in the social and orderly manner approved at Hitcham" followed, and the winners of prizes drank success in the cheering beverage to the Society. Then followed "God save the Queen; and may the valour of her gallant Army and Navy be soon crowned with a complete success;" "Good night, and good bye till, if it please God, we reassemble another year for a like friendly competition." Prizes were given to the children for wild flower nosegays as well as cultivated flowers, but all children who competed were required to bring a ticket for regularity and good conduct either at the day or Sunday school. There are drawbacks to everything, and those on the present occasion were some reports of wilful mischief as yet undiscovered done in the allotments, to which the Professor most properly adverted; but with these exceptions the happiness of all seemed as bright as the sunny day which they enjoyed. It would be well for the whole of our rural districts if such meetings became more and more multiplied; and though it is not every one that can expect a Professor Henslow, yet the knowledge and influence of the clergy might create most useful auxiliaries to their higher objects in gatherings conducted like those at Hitcham. The lecturets were instructive to all, and the rich and poor seemed equally interested; and it was impossible not to notice with pleasure the respectful manners of the one class, and the kindness of the other. We trust the worthy Professor may be spared to see his good example largely imitated, and that the teachers of religion will become more and more impressed with the certainty that the truths of Nature well defined are capable of being made most effective auxiliaries to those of revelation. *S.*

Dioscorea Batatas.—Having purchased four roots of this newly introduced esculent in spring, and seeing there was likely to be some discussion respecting its merits, I became anxious to know the state of my plants. I have now examined two of them, and have come to the same conclusion as "Quercus," viz., that until this Yam gets a fair trial it is wrong to say anything against it. For my part, considering the smallness of the roots (about the size of Peas), and the precariousness of the present season in being so little free of frost, I am pretty well satisfied with my success. I have hopes that another season with larger roots to start with, and with produce bearing the same proportion to sets as this season, the return will be reasonable, for it is generally acknowledged in Potato growing that a strong bud or set from a large tuber gives a better return in weight than a small set or a little Potato planted whole. Of this I am certain, that few would expect much from sets not larger than Peas, as was the case with most Dioscorea roots this spring. On receiving mine in January I put them into 3-inch pots, and when the weather became mild in May I planted three of them out in a prepared piece of ground; they were then a few inches high, and I protected them a little at night for a short time. On the 20th of June they were killed with frost to the ground, when they had to push fresh shoots, and this retarded their progress considerably. On taking up one of them it had made a root 5 inches long, club shaped, and weighing about 1 oz. At the time I planted out the three roots I put the fourth one into a large No. 1 pot, and kept it in a small forcing pit through the summer, where it grew very rapidly. The root now weighs 5¾ ozs.; it is somewhat distorted, owing to its downward passage being interrupted by the pot, at the bottom of which the roots were obliged to cross each other. The tops were fully 6 feet long, and the plants produced about 60 such tubers as were sent out in spring. After making about 100 cuttings from the tops, I tried a cow with the remainder, which she readily consumed. *R. Farquhar, Pynie Castle, Aberdeenshire.*

The People's Park at Sunderland.—There must surely be some mistake about the statement (Newspaper p. 262) wherein this park is described as being unsurpassed by any public park in England. I have visited Sunderland, and can find no public park there worthy of the name. There is a portion of ground which is called Boyldon Hill, about 6 acres in extent, which has been a quarry for the use of the town, and about 3 acres exist in front of the quarry. The rubbish heaps have been grassed over and walks formed (from plans drawn by the town engineer) which display in my opinion neither taste nor judgment as far as landscape gardening is concerned. A few small beds are placed by the side of the outer walk, so as to form a belt in which there are a few annuals. This belt is planted thickly with Poplars of different kinds, and a few are distributed about the lawn, the whole reminding one of the Willow beds by the edge of the Trent more than of a public park. It is stated that these grounds have been laid out by Mr. Smith from Chatsworth. Permit me to ask if Mr. Smith is a gardener there? If so, the unrivalled beauty of that princely establishment seems to have given him no correct idea of the kind of taste and judgment required in laying out grounds. Judging from the police reports in Sunderland it would appear that some of the inhabitants considered the grounds as laid out by Mr. Smith only fit to tether their donkeys on; let us hope, however, that this opinion is entertained only by the few, and that the majority of the good folks of Sunderland think differently. *J. S.*

Garden Sports.—I told you some years ago about a Currant bush that would almost make a fit companion to the Gooseberry bush near Glasgow. I received it more than 20 years ago for that variety of Currant called Champagne, something between a red and a white; but instead of bearing one variety it bears three, in different parts of the bush, namely, a red, a white, and a Champagne. The bush is still in a healthy state, and kept up its character to the present season. *Peter Mackenzie, West Plean, Stirling.*

Zinc Weathercocks.—Will any of your correspondents who understand these things be so kind as to inform me if a zinc weathercock, and other ornamental work, on the point of a high tower on the sea coast will be less liable to attract lightning than if made of iron, and also whether painting it would make it more safe; also, if copper bell-wires attract lightning less than iron ones—the mass of bell-wires now placed under the floors of houses seems to be more dangerous than the old mode of fixing them? Any information on this subject would be very acceptable to *One who is Building a House by the Sea Side. Sept.* 25.

Transplanting Machines.— Which is the Best?— I cannot afford time, neither do I undertake, to notice every scribbler on the vexatious and, as yet, little understood subject of removing large trees successfully; however, your correspondent, "T. C., Tadcaster," demands from me a few cursory remarks. He says (*Gard. Chron.*, Sept. 8, p. 598)—"The Rt. Hon. E. Strutt's machine, at Kingston Hall, is somewhat similar to Mr. Barron's, but considerably improved, which the nature and circumstances of the work required; at the same time it is but justice to Mr. Barron to say that to him belongs the merit of the invention of the original." I have yet to learn what authority or proof "T. C." can give for his assertion that this machine is a "considerable improvement" upon mine. As "T. C." apparently wishes to do me justice in this affair, I am bound to do him justice in supposing that he has not had all the facts of the case brought before him; I therefore beg respectfully to draw his attention to what follows:— After many years' constant practical experience in transplanting trees, and constructing and improving machinery for the purpose, the Right Hon. E. Strutt, of Kingston Hall, applied to me, through Mr. Mackay (the gentleman who afterwards conducted the planting operations at Kingston Hall), for a drawing of my large machine; I then gave him permission to take any dimensions he wished from my machine, which was then almost daily passing through Derby. This was done by Mr. Cowlishaw, the person who built the Kingston machine. At that time neither Mr. Cowlishaw nor Mr. Mackay professed any knowledge of the undertaking. Mr. Cowlishaw, who was a good workman, adopted some trifling alterations in trussing the beams, &c., but without in the least affecting the principle of my machine. After this a second machine upon the same principle, but smaller, was built for the Rt. Hon. E. Strutt, which Mr. Mackay likes better than the large one; and last year I was indebted to the Hon. and worthy gentleman for the use of this machine for several months when all my machines were fully employed. One which I built in 1853, upon a different and much improved principle, was used with the machine from Kingston Hall, and it was with difficulty that the workmen could be got to use the one from Kingston when the other was to be got, as a tree could be loaded and unloaded much easier, and in half the time, with my No. 3 machine. This year (1855) I have built another, which is an improvement upon the one built in 1853; so that in reality the machines stand in efficacy and merit in the following order. No. 1, my original machine, which was built more than 24 years ago, was the one which Mr. Cowlishaw professes to improve upon; and yet it removed larger trees, from a greater distance, and many more of them, than were ever removed by the largest one at Kingston Hall, and they can be seen here in a healthy state. Nos. 2 and 3, the Kingston machines. No. 4, my largest machine, more powerful than No. 1, and improved in construction, still without any of Mr. Cowlishaw's "improvements." No. 5, built in 1853; No. 6, built in 1855: these are quite different from any of the others, and the last is the best. But to the point; to compare any of the machines now mentioned with one another, or to compare what has been done at Kingston Hall with what has been done at Elvaston Castle and some other places, is just as absurd as to compare Mr. Barron with himself; every honest man at all conversant with the matter knows that my system only has been adopted at both places. *William Barron.*

Draining and the Sugar Cane in Jamaica.—I should be obliged by the opinion of any correspondent on the following point. The thermometer here, Jamaica, in the sun is about 120° Fah.; the soil about 6 inches on heavy clay, generally. We are subject to droughts, when the fields are full of rents you may step into; and to continued heavy rain, which I presume must injure the roots, as the land becomes so swampy and boggy. Our cultivation is Sugar Cane and common Grass, in beds of 12 and 16 feet, with trenches a foot wide. If this land were drained, should it be feared the soil would become so dry, in dry weather of perhaps a month or two, that the root of the Cane might perish from heat in the soil or lack of moisture? The drains would be of broken stone, covered with clay I suppose necessary, and say 3 feet deep. There is sufficient fall. *John Salmon, Jun., Goshen, St. Elizabeth, Jamaica.*

Horticulture in the Hebrides.—The following is a small notification of progress in our art here (Stornaway Castle, Island of Lewis), which may serve to show what can be done in this bleak corner of the kingdom. A society having been formed several years past in Stornaway, under the auspices of Sir James and Lady Matheson, to encourage the delightful pursuit of rearing fruits and flowers in this storm-beaten island, I had the gratification of seeing a most creditable display of vegetables and flowers at our two shows this year, the first being in July, and the second in September; at the last, which was held at the Castle, the grounds and beautiful flower gardens were thrown open to the public. The Geraniums, Fuchsias, Roses, Carnations, Myrtles, and Bouquets, &c., might have gained prizes in the genial south; and as to the vegetables I never saw better. *J. C., Stornaway.*

The Stanwick Nectarine.—I have sent some Stanwick Nectarines for your opinion as to flavour, &c., by consent of my employers, who are not now at home to require them. The tree was had from Messrs. Veitch & Son, three years ago, to plant on the open wall; but learning it was a sort not likely to do out of doors, it was taken up again the following autumn, cut close back and potted the next season, and grown under glass, where it made a fine growth. This year it fruited in a late vinery, in the place of two Vines that were removed; it flowered freely and set a large quantity of fruit, which I thinned out to about five dozen; but during the process of stoning, rather better than half the quantity of fruit shrivelled and dropped off, leaving after all a good crop of Nectarines that are all likely to ripen without a cracked fruit. No fire heat was applied till the Vines were in flower, consequently the fruit was a large size before any assistance was given beyond what the glass afforded. *Geo. Hood, Gardener, Mamhead Park, Exeter, Devon.* [These were very fine, without a speck or crack. Three of them weighed 13½ ounces. The flavour was excellent, though hardly so rich as it sometimes is; the flesh tender and full of juice.]

Hardy Eucalyptus.—The Eucalyptus from which the accompanying bits were cut, has stood since the beginning of summer against a south wall in this not quite tropical climate. The growing of it is one (and, I dare say, the rashest) of a good many little experiments

which I have been making for a couple of seasons on the hardiness of exotic shrubs and trees. I have no flowers to show, but if the leaves and branchlets are enough for identification, I should be much obliged by learning the specific name. The plant came from an Edinburgh nursery, labelled "Eucalyptus glauca." *W. S., East of Fifeshire, Sept.* 24. [The plant is Eucalyptus cordata, a Van Diemen's Land species. The fact recorded by our correspondent is extremely interesting. He should try Eucalpytus coccifera, which stood the last winter near London against a wall unprotected, without sustaining any injury.]

Foreign Correspondence.

The Délices d'Automne Strawberry.—The following letter concerning this variety has been received by Messrs. Low & Co.:—"As we had no plants left of the Délices d'Automne Strawberry, we endeavoured to procure a hundred with flowers and fruits to send to you; but to our astonishment they were only old plants which are again commencing to bear fruit; their flowers are very large, about 1½ inch in diameter. It was only on the 2d November, 1854, that we first saw the Strawberry, and it had then a remarkably fine appearance. From that time till the 29th of the same month, we ourselves saw all the old plants in the open ground bearing from three to ten scapes, with fruit such as we sent you on the 5th November. The raiser, and some amateurs of this town assured us that from the month of September this Strawberry produced fruits in abundance until the frosts set in. Now we find, that at the time we write, there are, it is true, some scapes with flowers and fruits, but not in abundance as we had been led to believe. The plants are, however, coming into bearing, but it will be a fortnight before they will be in the state which they ought to have been in the course of the present month. Another important circumstance of which we have just been informed is, that it is necessary to cut off the runners in order to induce the plants to bear sooner; and as the raiser has allowed them to run, in order to have a greater number of plants, the production of fruit has consequently been retarded. The plants do not bear before they are two years old. It appears, moreover, that runners of the British Queen had, last autumn, got amongst those of the Délices d'Automne, and very probably you have some of the British Queen amongst those sent to you. In short, if we had known beforehand all these disagreeable matters, and also that the young plants of the Délices d'Automne would not bear fruit before they were two years old, we would not have taken it in hand; and still less would we have recommended it to you. In a fortnight we will send you, gratis, 100 plants in a bearing state, for the satisfaction of your customers. From this date we cease to recommend this Strawberry as really bearing a second crop in September, as we had been assured, and we shall no longer continue to sell it. What pains us most is that you have purchased a large quantity of plants on our recommendation, and that you receive complaints from your customers respecting them. But we will indemnify you, as you will expect." *L. Jacob Makoy & Co., Liége, Sept.* 19.

Societies.

BRITISH ASSOCIATION AT GLASGOW.

Section D.—Zoology and Botany.—*On Vivaria.*—Mr. N. B. Ward commenced his paper by explaining his reasons for appearing a third time before the British Association; these reasons being—1st, the misapprehensions of the public respecting the growth of plants in closed cases; and 2d, the statements of the editor of the *Gardeners' Chronicle*, which statements Mr. Ward proceeded to show were unphilosophical and untrue; and 3d, to give a plain history of the origin of the Vivaria, which arose out of the experiments on the growth of plants, the success of both depending upon the fulfilment of the natural conditions both of the plants and animals. As it was possible that many of the audience might not have heard of these cases or their applications, Mr. Ward then went on to detail the accidental commencement of his inquiries, and to point out, by reference to his writings, his entire conviction, that to command Nature we must obey her laws. The opinions of the learned editor were then considered: these opinions being chiefly that plants could not grow in the closed cases, in consequence of the stillness of the atmosphere, which did not allow superfluous moisture to be carried off, and that in them one mode of death was only superseded by another; that the plants died of dropsy, instead of perishing by thirst; and the conclusion at which the learned Doctor arrived was, that the Wardian cases, although he allowed they had their value as a means of transporting plants, yet as a means of their growth they were utterly valueless; that they could only be considered in the light of *tripe de roche* to a starving person; and that the time would come when people would wonder at the delusion which led them to believe that plants *could grow* in a Wardian case. To rebut those opinions, Mr. Ward exhibited specimens of plants growing in quiet and disturbed media, observing that the amount of moisture was always at the command of the experimenter, and that it was quite as easy to destroy plants by thirst in a closed case as to kill them by redundance of moisture. It does not appear from Dr. Lindley's Paper that he had instituted a single experiment to test the valueof his hypothesis. Mr. Ward then proceeded to consider the facts of the case as proved by innumerable experiments—the first great experiment being at the instigation of the British Association, who appointed a committee, consisting of Drs. Daubeney, Dalton, and Mr. Yates, to investigate the correctness of Mr. Ward's views and statements. A closed house was built in the Mechanic's Yard at Liverpool in 1837—was filled with 80 exotic plants, which passed the winter without injury, and several of them had flowered and ripened seed. Numerous other instances were adduced, the results being invariably that, where the natural conditions of the plants could be strictly fulfilled as regarded heat, light, moisture, and periods of rest, the quiet condition of the atmosphere, so far from being an injury, was of great service, enabling them to bear variations of temperature which would be injurious to them in their natural situations, and in some cases to attain an unwonted luxuriance. The complete success of the plan in the conveyance of plants to and from distant countries was next adverted to, there not being a single civilised spot on the surface of the earth which had not benefited by their introduction. Twenty-thousand Tea plants had been introduced into the Himalayan Mountains, and several hundred plants of Cinchona into the forests of Java. Mr. Ward referred to communications he had received detailing experiments, from which we extract the following:—Dr. Alfred Smee had favoured Mr. Ward with an interesting statement of his experience in cultivating plants in the Wardian case. The advantagesof such cultivation he stated as follows:—"Plants in a Wardian case grow, ripen, and decay without being touched with wet or rain. From this cause the leaves present an unsullied freshness; for dust never incrusts them, wet never damages them, nor does the blasting easterly wind ever wither them. Such advantages give the closed case much claim to our attention; and we have only to avail ourselves of its capabilities to obtain that which may gladden the eye by its beauty." Dr. S. had cultivated Stanhopeas, Oncidias, and other orchidaceous plants, as well as Passion-flowers, Ferns, &c. "I am satisfied (he added) that in every situation where the light of heaven shines, some plant may be cultivated in closed cases, and therefore I hope that every year they may become more extensively used." Dr. J. D. Young, Kennington, wrote—"Its advantages, in my mind, are so great, its extension to practical purposes so numerous, that I am inclined to say its utility is still in its infancy. You know how I have struggled for many years, under difficulties of almost an insurmountable kind, to keep alive some of our most delicate plants, surrounded by smoke emanating from gas-works, a pottery, &c. And yet I find they flourish. I have closed cases in which the Trichomanes and the Hymenophyllum have for years grown without any change of soil." The same writer expatiated on the pleasures and advantages of the invention. The Vivaria in the Regent's Park originated as follows:—Mr. Ward stated that Priestly was the first to discover the counterbalancing action of plants and animals upon each other in water as well as in the atmosphere; that these experiments were followed up by others, and mentioned by Brande in one of the early editions of his Chemistry; and that the use of the Limnæus in removing decaying portions of vegetable matter was pointed out by Jeffrey in the Transactions of the Linnæan Society for 1830, who calls these animals "the scavengers of the waters," and likewise in the journal of the Microscopical Society for Sept., 1841. With the knowledge of these facts, Mr. Ward, being well convinced of the application of the same principle applied to animals as well as to plants, filled a large earthen vessel, holding about 20 gallons of water, with fish, plants, &c., &c., in the year 1841, in his Fernhouse, in Wellclose Square, with the view of determining whether the volume of air surrounding this miniature pool would be sufficient for the well-being of the new occupants. In this pool they lived and flourished for years, the water never being changed, but retaining its purity in consequence of the conditions above alluded to. Very shortly, however, after the commencement of Mr. Ward's experiments, Mr. Bowerbank pursued the same plan in a large glass jar; and it was this jar which gave Mr. Mitchell the idea of the Vivaria in the Regent's Park, and to him the sight-seeing public are under the greatest obligations. Mr. Ward then directed attention to some most interesting original observations by Mr. Thynne, which the late ever-to-be-lamented Edward Forbes had intended to publish, but which he allowed to Mr. Ward the privilege of using in a lecture by Dr. Stephen Ward at the Royal Institution. Mr. Ward then proceeded to urge upon the members of the British Association the necessity of prosecuting their inquiries among the higher members of the animal kingdom, as he felt well assured that the same principle was applicable to the entire animal kingdom—even to man, "the great master of all." Mr. Ward had stated, in his work published in 1842, his idea that, by a combination of the growth of plants and by chemical agency, any required atmosphere might be obtained for remedial purposes, and proceeded to explain the method by which Payeine purified the atmosphere in his submarine vessel. He concluded by some observations on the all-important subject of the fulfilment of the laws of God, and the wretchedness and misery consequent on their infringement. *Communicated by the Author.*

Notices of Books.

Since our last we have received two more of the Messrs. Black's useful little *guide books*—one for *Devonshire* and *Cornwall*, the other for the *island of Skye*. The latter, which we much prefer, is furnished with valuable information concerning the geology of the Cuchullin Hills and of Loch Staffin, the first by Prof. James Forbes, the second by the late Edward Forbes. Of these dissertations the last is, we believe, now printed for the first time.

We have also before us the second edition of *Mr. Frederick Currey's* excellent translation of *Schacht on the Microscope* (Highley, 5*s.*) This work was favourably noticed by us on a former occasion (1853, p. 726); we have now to announce that many very useful additions have been made to the present edition, in part by the translator and in part by the author himself. Now that fine microscopes are becoming cheap, and accessible to all educated persons, works of this kind increase greatly in value; for the young observer, placed by himself, with the best instrument in the world, will see little, and that not very correctly, in the absence of such practical instructions as Schacht supplies.

Page's valuable little *Introductory Textbook to Geology* (Blackwood's, 1*s.* 6*d.*) has reached a second edition.

Garden Memoranda.

C. Loddiges, Esq., Hackney.—Our readers, like ourselves, must see with regret the announcement in our advertising columns that Mr. Loddiges is about to part with his Orchids, of which we need not say he has a most extensive and valuable collection, the gathering together of which has occupied the greater part of the last half century. The announcement must be looked upon with regret in two ways—first, because the present state of Mr. Loddiges' health will not permit him to stay sufficiently long in his houses to enjoy the beauty of his plants, as he has been accustomed to do, and which we understand is the only reason for his parting with them; and, secondly, because it is just possible that this magnificent collection, which it has taken so many years of activity and trouble to bring together, may be lost to the country for ever; for we understand that offers to transfer it to the continent have already been made to Mr. Loddiges. Let us hope, however, that some spirited individual may see the advantage of still retaining it, entire as it is, in England.

In inspecting this collection the other day we found that it contains some 1200 species, numbers of which have not yet bloomed in this country, and therefore their names have never been determined. Conspicuous among rarities was a Dendrobium in the way of speciosum from the north coast of New Holland, but said to be very different from that species; also Dendrobium bigibbum, a kind with rose-coloured flowers, and many others.

In a lean-to house 150 feet in length we remarked fine masses of Lycaste Skinneri; also plants of Cattleya Loddigesi in bloom; various Oncids, among which O. bicallosum and Cavendishi were conspicuous; Odontoglossum grande showing flower, and two fine plants of Lælia superbiens. Of these Lælias, one has flowered this summer, the other is now showing for bloom. They were both growing near an open tank, the evaporation from which Mr. Loddiges finds beneficial to their health. This house has always been kept very cool, a fact which will be apparent when we state that as yet no fire heat has been applied to it this autumn, and even in winter the temperature is seldom above 50°. Yet under this treatment, and frequent bedewings overhead in the summer and autumn evenings, the plants are maintained in excellent health. In a warmer span-roofed house were some fine specimens on blocks of the handsome Brazilian Sophronitis grandiflora; and in the show-house we noticed Oncidium purpuratum, a pretty species intermediate between Lanceanum and luridum, but possessed of gayer colours than the latter; this was beautifully in flower, as was also Oncidium Barkeri, a sweet smelling kind with a large yellow lip. Cattleya Harrisoniæ and bicolor were likewise in bloom here, as was also the charming little C. marginata and others. Associated with these were some extremely handsome Ferns, especially Mertensia flabellata and Gleichenia scandens. The latter is about 4 feet in height, beautifully furnished with leaves, and is altogether perhaps one of the best plants of the kind in the country.

In a span-roofed house leading out of the show-house were some fine specimens of Vandas, including Batemanni, violacea, suavis, tricolor, with its many varieties, and others. We also noticed here a large plant of the black-lipped Cœlogyne pandurata, the true Phalænopsis amabilis, which is now getting scarce in collections, P. grandiflora having become more fashionable, and many kinds of Dendrobes and Aerides. Among the latter was pointed out to us a variety of quinquevulnera named superbum, which is said to be larger and darker than the species. Of other conspicuous plants, one of the most remarkable was the white flowered Indian Cymbidium eburneum. This was a magnificent specimen, which will soon be in blossom, 8 flower spikes fast approaching that condition. To attempt, however, to direct attention to even the best plants in this collection would be a tedious task; it may therefore be sufficient to say that, in regard to all of them, a marked improvement has taken place since they have been brought from the old houses in the nursery (no vestige of which now remains) and placed in their

present situations. A new plan which Mr. Loddiges has adopted of supplying moisture has doubtless added much to their improved condition, and may therefore be worthy of notice. It is as follows:—in the centre of one of the principal houses is a raised bed, the whole top of which is an open tank lined with lead, so as to hold water in summer, and with inclination sufficient to allow it to be drawn off in winter. Over this water the larger and finer specimen plants are arranged, the baskets in which they are growing being elevated a little above the water on wooden legs which stand on the bottom of the tank. By this arrangement it will be seen that the plants are always in the midst of a congenial and moist atmosphere, and that the greater the heat is the larger is the amount of evaporation, and that in winter when it is not wanted it can be entirely withdrawn.

Calendar of Operations.

(For the ensuing week.)

PLANT DEPARTMENT.

Conservatory, &c.—Those who are under the necessity of wintering valuable specimens of New Holland and other hard-wooded greenhouse stock in this house should regulate the temperature, &c., so as to render it as suitable for these as possible, and a good stock of the most suitable things for flowering in a low temperature must be provided for winter blooming. This is no easy matter, however, as almost all plants require to be kept somewhat warmer while in bloom than is suitable for greenhouse hard-wooded stock during their season of rest, and it is anything but desirable to have to winter the latter in a house that has to be kept gay with flowering plants; for in this case, there is a constant temptation, if not an absolute necessity, to keep the atmosphere warmer than is suitable for these. But where there is no better accommodation for wintering specimen plants of hard-wooded things than the show-house, then a good stock of Camellias, Epacrises, Winter-blooming Heaths, Cytisus, Daphne indica, Acacias, &c., should be provided for winter flowering, which if properly prepared bloom profusely in a cool house and require no more artificial heat than may be necessary to keep the temperature at about 40°, and prevent the flowers being injured by damp. And with a good stock of these and other things which bloom in winter without much artificial heat it is just possible to keep the house tolerably gay and to winter valuable specimens of hard-wooded stock in it without greatly injuring them; but to attempt to winter large well grown specimens of New Holland and Cape plants in a house where the temperature, &c., is regulated for a miscellaneous collection of plants in bloom is sure to speedily ruin the specimens. Keep greenhouse stock which has been placed under glass cool and airy, and avoid crowding, especially in the case of things which are in a growing state, but everything must be allowed sufficient space, so that the foliage, &c., may be fairly exposed to light and air, and rather than be under the necessity of huddling specimens too thickly together some of the least valuable should be thrown away. Look sharply after mildew upon Heaths, as this pest is sometimes very troublesome upon plants that have been growing freely in a shady situation in the open air, and are in a rather soft state when taken in doors, and apply sulphur freely on the first appearance of the enemy. Also see that everything is clear of insects. Take advantage of leisure hours to get Azaleas which have made their season's growth nicely tied, as also anything else requiring training, and endeavour to keep everything as trim and neat as possible, in order to compensate, as far as possible, for the paucity of flower among hard-wooded plants at this season. Cold Pits.—Plants which have made their season's growth should be freely exposed to sun and air on every favourable opportunity, in order to get the wood well ripened. But such things as are still in free growth should be encouraged by every possible means while fine weather continues, keeping them rather close, guarding them carefully from cold winds, and giving a liberal supply of water at the root. If anything requires more pot room get such shifted as early as convenient, keeping the atmosphere rather close, and watering very cautiously for some time afterwards until the roots get hold of the fresh soil.

FORCING DEPARTMENT.

Pineries.—Attend to last week's directions, and endeavour to afford plants on which the fruit is ripening a warm rather dry atmosphere with a moderate circulation of fresh air on bright days, and whenever this can be done without lowering the temperature too much; also keep young stock growing as freely as may be consistent with securing stocky plants, giving them a liberal supply of manure water at the root, and maintaining a moist atmosphere. Be as sparing of fire-heat, however, as circumstances will permit, shutting up early on the afternoons of bright days, but give air rather freely in the early part of the day, which will assist in preventing weakly growth, and after this season the syringe must not be used too freely, even on young growing stock, and where the atmosphere can be kept moist at pleasure by means of tanks, &c., syringing might almost be discontinued for the season; at all events avoid syringing so heavily as to cause water to lodge in the hearts of the plants, which tends to blanch and weaken the foliage. Look over young stock growing in pots, and shift any requiring more pot-room without delay, so that it may get rooted into the fresh soil before winter; and see to having the balls moist at the time of shifting, for neglect of this is a frequent cause of young stock fruiting prematurely. Vineries.—Vines that are to be forced very early, provided the wood is well ripened, and the leaves mostly off, should be pruned and dressed, keeping the house as cool as possible, in order to prevent bleeding; for it is difficult to get Vines sufficiently dormant at this season that bleeding will not occur to some extent after pruning. And so injurious is this in weakening the Vines that where there is any danger of its occurring to any serious extent pruning should be deferred until the Vines seem to be fairly at rest. It will also be advisable to cover the outside border of the early house with something that will throw off wet in order to keep the roots as dry as possible while the Vines are at rest, and secure having the border in a dry healthy state when forcing is commenced; but this need not be done until there is some appearance of wet. The weather is extremely favourable for getting late Grapes ripened, and these should be assisted with a moderate amount of fire heat, in order to get them coloured while bright weather continues, and the sun has some power. Figs.—The second crop of these will now be getting over, and every possible attention should be given to the ripening of the wood, keeping the young shoots thin and closely tied in, so as to expose them fully to light and air. Also keep the atmosphere rather dry; and the borders can hardly be kept too dry after the fruit is gathered. Any over luxuriant shoots should be stopped, or cut out altogether where they can be spared, and trees that incline to be of a gross habit should be severely root-pruned as soon as this can be done, without risk of injuring next crop; for unless short-jointed firm wood can be obtained an abundant crop of fruit need hardly be expected. Melons.—Unless where these are particularly wanted late in autumn, they should be pushed on as rapidly as possible; for besides being very uncertain late in autumn, fruit ripened after damp cloudy weather has set in is seldom good for much. Maintain a brisk steady bottom heat, keeping the atmosphere rather warm also. Keep the Vines clear of laterals, remove decaying leaves immediately they are perceived, and use every means to keep the foliage clear of red spider and in a healthy state.

FLOWER GARDEN AND SHRUBBERIES.

The season is now so far advanced that frost may occur any night while the wind is northerly, and any scarce plants which it may be desirable to secure before they are injured should be taken up and potted at once, or carefully covered when there is the least cause to suspect frost. See to securing a good stock of cuttings of the variegated Geraniums before the plants are injured by frost, for although these root more freely in spring than at present, such varieties as Golden Chain and Mountain of Light grow so slowly that spring-rooted cuttings make but very poor plants by turning-out time, hence it is desirable to gain size, if at the expense of the loss of a few cuttings. And we do not believe all that has been said in a contemporary about the difficulty of rooting Golden Chain in autumn, for we have experienced no particular difficulty in rooting it at this season; but we may be fortunate as regards convenience, which is simply a flue running underground in the open air; this we cover with a suitable depth of soil, and protect the cuttings by hand-glasses. That cuttings taken from plants growing in the open ground are liable to damp in a moist warm place is well known, and the variegated Geraniums are perhaps more so than most things; but persons who can command a gentle bottom-heat without keeping the atmosphere warm and moist will experience no difficulty in rooting them now. The old plants of these are, however, well worth wintering wherever room can be found for them, for these go much farther at planting-out time, and cover the beds sooner with foliage and flower than either autumn or spring rooted cuttings; hence they should be carefully guarded from frost until the beauty of the garden is destroyed, when they should be taken up, potted, and stored away for the winter in a cool dry house. Continue to put in cuttings of Hollyhocks, as these can be obtained until there is an ample stock of rooted plants, and do not allow those that were rooted early in the season to suffer for the want of pot room. Cut off the flower stems of herbaceous plants as soon as they become shabby, and endeavour to prolong the beauty of Phloxes, &c., by keeping them well supplied with water at the root. Also keep the beds and everything about the flower garden and grounds trim and orderly.

HARDY FRUIT AND KITCHEN GARDEN.

Look over choice Pears and Apples at short intervals, and gather such of the fruit as may be found to readily part from the tree. Espalier and dwarf standards, or indeed any kind of fruit trees which exhibit more tendency to produce useless wood than such as is likely to furnish fruit, should be root pruned as early as convenient in the autumn, cutting out any useless shoots at the same time, in order to expose the wood expected to bear fruit as freely as possible to light and air, so as to get it ripened. Provision should be made for protecting a quantity of French Beans from frost should this occur, and Cauliflowers should be looked over frequently, turning down a few leaves over the hearts, for these are readily spoiled by frost. Get a lot of brown Dutch or Bath Cos Lettuce planted where they can be protected by frames for spring use; attend to the earthing up of Celery that is likely to be wanted for use soon, keeping it closely soiled up, so as to get it well blanched. Keep the late crop of this well supplied with manure water while growing weather continues. Get Onions dried, and stored.

STATE OF THE WEATHER AT CHISWICK, NEAR LONDON,
For the week ending Sept. 27, 1855, as observed at the Horticultural Gardens.

Sept.	Moon's Age.	Barometer. Max.	Barometer. Min.	Temperature. Of the Air. Max.	Temperature. Of the Air. Min.	Temperature. Of the Air. Mean	Temperature. Of the Earth. 1 foot deep.	Temperature. Of the Earth. 2 feet deep.	Wind	Rain

Satur. 6	60.8	42.3	51.6	16	0.78	1	3	3	3	3	9	5	2

The highest temperature during the above period occurred on the 5th, 1834—therm. 80 deg.; and the lowest on the 2d, 1853—therm. 27 deg.

Notices to Correspondents.

American Seeds: *Tuamensis.* They are raised exactly like other tree seeds. Sow them in the spring in beds of light earth, the small seeds just scratched into the ground, the larger ones an inch deep. At the end of the year the seedlings should be taken up and lined out, that is to say planted in lines a foot apart, and 6 inches from plant to plant. Less space will do if you are badly off for room.

Bananas: *D N.* In their own country they are always dried by mere exposure to the sun. Here, where the sun is so powerless, some other process would be requisite. Would not drying in a brick oven after the bread is withdrawn answer equally well? We should expect so.

Begonia fuchsioides: *A Balfi.* Certainly not a greenhouse plant, properly so called. But it is very difficult to say what are the precise limits between a greenhouse and a stove.

Concrete: *A Sub.* Use fresh burnt lime and add as much of it and water as will just make the gravel hold together. The gravel should be washed clean.

Insects: *W B.* Your caterpillar, which had gone into chrysalis in the box before it reached us, appears to be that of the Elephant Hawk moth, Sphinx Elpenor.—*M M D.* Your Pear leaves are attacked by the slimy larvæ of the black-winged saw fly, Blennocampa æthiops. Dust the leaves with powdered lime, or syringe with lime water.—*G M.* See the last answer. This appears to have been a year very favourable to the development of the larvæ of various injurious kinds of saw-flies.—*J J.* See the preceding answers. *W.*

Mountain Ash: *Malvern.* Gather the berries when ripe. Mix them with pit sand, and form the mixture into a cone in any out-of-the-way place for the winter. In March rub the berries to pieces with the hands, and sow in a bed of light soil, covered about half an inch deep. If your quantity is too small for this, then put the sand and berries into a garden pot, in any out-house for the winter.

Mulberry Tree: *J B.* Pare the great wound carefully till all ragged parts are removed, and then leave it to its fate. Do it in winter. Plaister, &c., are unnecessary; it will not decay, provided the wound slopes enough to throw off rain.

Names of Fruits: *G.* 1, Beurré d'Aremberg; 3, Winter Bon Chrétien, and certainly quite unfit for your climate; 5, probably Beauty of Kent; 6, 10, Downton; 7, Yellow Ingestrie; 9, Mank's Codlin; 12, perhaps Passe Colmar in a very immature state.—*Semper Vivo.* 1, Beurré Diel; 2, Napoléon; 3, Ne Plus Meuris; 4, Marie Louise; 5, Passe Colmar; 6, Easter Beurré.—*Received. J H.*

Names of Plants: We have been so often obliged to reluctantly decline naming heaps of dried or other plants, that we venture to request our correspondents to recollect that we never have or could have undertaken an unlimited duty of this kind. Young gardeners, to whom these remarks more especially apply, should bear in mind that, before applying to us for assistance, they should exhaust their other means of gaining information. We cannot save them the trouble of examining and thinking for themselves; nor would it be desirable if we could. All we can do is to *help* them—and that most willingly. It is now requested that, in future, not more than four plants may be sent us at one time.—*Sir C. L.* Your Cactus-looking plant, which has flowered so prettily, is the *Phyllocactus anguliger* found by Hartweg in 1846, inhabiting the trees of an Oak forest near Matanejo, in West Mexico, and distributed by the Horticultural Society. It is figured in Paxton's "Flower Garden," vol. i., pl. 34, from a plant which flowered in the garden of the Society at Chiswick in 1850. *B.—H Sharp and W M.* It is the Clover dodder, Cuscuta trifolii, a most destructive parasite.—*A Z.* Spiranthes autumnalis has been called Ophrys spiralis, and Neottia spiralis.—*B H C.* Spiranthes autumnalis.—*B H L.* Atriplex patula.—*Semper vivo.* 1, Juanulloa parasitica; 2, Lycopodium denticulatum; 3, Polypodium piloselloides.—*J F.* Oncidium incurvum.

Orchard Houses: *A Sub.* We do not conceive that a lean-to would answer the purpose well. The object in this kind of house is to have all the air that can possibly be procured; and a lean-to will hardly supply that.

Private Growers: *H B.* We have no more to say. You must form your own opinion. Very small circumstances modify conclusions. Mr. Beck was for years a shower in the nurseryman's class; but surely Major Foquett was an amateur.

Preserved Ginger: *T H.* asks for the best mode of preserving Ginger in its green state. Hers when taken from the stove, always turns black.

Root-pruning: *Mr. H B Mont Rose.* They were over-pruned in 1852, have never recovered, and now have been called upon to nourish a heavier crop than the most vigorous trees could support. What will become of your calves if you put a dozen to one cow?

Roses: *J M.* Your Rose, which is apparently one of the Tea-scented kinds, is evidently too tender for your climate. It requires more warmth to enable it to open its buds than your locality affords.‡

St. Ignatius's Beans: *G W L.* These are nearly the same in their property as Nux vomica, and are produced by the Strychnos Ignatii. In small quantities, in skilful hands, Nux vomica is employed advantageously in paralysis, impotence, and various affections of the nervous system. But caution must be observed in using it. St. Ignatius's Beans probably produce such effects as are described in the pamphlet.

White Nectarine: *P P.* Various causes may be assigned for White Nectarines cracking, and the stone decaying, before the fruit is ripe. Perhaps the best remedy for the evil would be mulching the roots early in summer and keeping it on until the fruit has reached maturity.

Misc.: *Tuamensis.* Will you favour us with your address.

THE FOLLOWING MANURES are manufactured at Mr. LAWES' Factory, Deptford Creek:—Turnip Manure, 7*l.* per ton; Superphosphate of Lime, 7*l.*; Sulphuric Acid and Coprolites, 6*l.*

Office, 69, King William Street, City, London.

N.B. Genuine Peruvian Guano, guaranteed to contain 16 per cent. of ammonia. Nitrate of Soda, Sulphate of Ammonia, and other Chemical Manures.

THE LONDON MANURE COMPANY'S NITRO-PHOSPHATE OR WHEAT MANURE FOR AUTUMN SOWING.—This Manure, composed of blood, animal matter, and dissolved bones with silicates, is most strongly recommended to the notice of Agriculturists. It contains from 7 to 8 per cent. of nitrogen, in a form yielding ammonia by slow decomposition, and is therefore particularly adapted for Wheat. The quantity required is 2 to 3 cwt. per acre drilled in with the seed. Price, per ton, 7*l.* 10*s.* in London.

PERUVIAN GUANO, FISHERY SALT, and every other MANURE on best terms, strictly warranted.

40, Bridge Street, Blackfriars. E. PURSER, Sec.

GUANO.—To be Sold, at the Brokers' Offices, Adelaide Buildings, Chapel Street, Liverpool, on FRIDAY, October 12, at 2 o'clock, about 4000 Tons of UPPER PERUVIAN GUANO, being direct importations from San Felipe by the following vessels:—The Utopia, Anna, Mirzapore, Envelope, Curraghmore, and Catherine.—For Catalogues and further particulars apply to the importers, Messrs. W. & J. Ravenscroft & Co.; or to the Brokers, GRIFFITHS, SONS, & PALETHORPE, Liverpool.

BLOOD MANURE FOR WHEAT.

THE PATENT NITRO-PHOSPHATE or BLOOD MANURE COMPANY.

TRUSTEES.

ABEL SMITH, Jun., Esq., M. P., 2, Halkin Street, West.
CHARLES DIMSDALE, Esq., Essendon Place, Herts.
EDWARD BALL, Esq., M.P., 8, Belgrave Road, Pimlico.
MAJOR-GEN. HALL, M.P., Weston Colville, Linton, Cambridge.
JOHN BRADY, Esq., M.P., Warwick Terrace, Belgrave Square.

DIRECTORS.

Chairman.—JONAS WEBB, Esq., Babraham, Cambridgeshire.
Deputy-Chairman.—JOHN SHARP, Esq., Tower Villa, Queen's Road, Regent's Park.
EDWARD BELL, Esq., Tottenham, Middlesex.
JOHN CLAYDEN, Esq., Littlebury, Essex.
RICHARD HUNT, Esq., Stanstead Abbot, Herts.
THOMAS KNIGHT, Esq., Edmonton, Middlesex.
ROBERT LEEDS, Esq., West Lexham, Norfolk.
ROBERT MORGAN, Esq., 72, Camden Villas, Camden Town.
THOMAS NASH, Esq., Great Chesterford, Essex.
JAMES ODAMS, Esq., Bishop Stortford, Herts.
JOHN COLLINS, Esq., Middleton Square, Pentonville.
(*With power to add to their number*).

Bankers.—Messrs. BARNETT, HOARE, & Co., Lombard Street.
Auditor.—JAMES CAIRD, Esq., Baldoon, and 6, Sergeant's Inn, Fleet Street, London.
Secretary and Chemist.—JAMES TAYLOR, Esq., F.C.S.
Solicitors.—Messrs. KINGSFORD & DORMAN, 23, Essex St., Strand.

MANUFACTORY, PLAISTOW MARSHES, ESSEX.

The Directors of the above Company (many of whom are eminent agriculturists), beg to call the attention of their friends and the agricultural community to their Patent Blood Manure, which is composed of Bones dissolved with sulphuric acid, to which is added about 1500 lbs. of pure Blood to every ton of the Manure, carefully dried and prepared for the drill or hand sowing. Being rich in Nitrogen and other necessary ingredients, it is especially adapted for the Wheat Crop, and has been used with the greatest success in all parts of England.

It is a very remarkable fact that the analysis of Blood and the grain of Wheat are nearly identical, as proved by the most eminent chemists; it contains all the elements which plants require, and when properly prepared and applied, will become the essence of vegetable as well as of animal life.

The highly fertilising properties of Blood has been commented upon by Professor WAY, and others, and the success of the Blood Manure for Wheat Crops has been fully proved upon all soils, by the practical experience of numerous agriculturists, a few of whom are the following:—

Sir Archibald M'Donald, of Woolmer Lodge, Liphook, says: "The Wheat manure I purchased of you has answered its purpose admirably."

Jonas Webb, Esq., Babraham, Cambridgeshire.—"Your Wheat manure I tried by the side of guano, and if anything it had the advantage, as the quality from it is superior."

Mr. Baker, Steward to His Grace the Duke of Bedford, Park Farm, Woburn, Bedfordshire.—"I used your manure upon a piece of poor land after Peas, and have grown an excellent crop of Wheat."

Mr. Benjamin Goulton, Gedney Marsh, Long Sutton, Lincolnshire.—"I drilled your manure at the rate of 2½ cwt. per acre, along with the Wheat over 30 acres, and although the field is the poorest land I have on my farm, the crop ranked amongst the best I have. I do not know how I can recommend it better than by saying I shall use it much more extensively this season."

Mr. Walter Murton, East Stour, Ashford, Kent.—"I sowed your Wheat manure last autumn, and the consequent increase in the crop both of corn and straw has convinced me of its great utility."

Mr. H. Steed, Nonington, near Wingham, Kent.—"I used Odams' Patent Manure for Wheat last November, and never have I used any artificial manure with such benefit."

Mr. Frederick Robinson, Southery, near Downham Market, Suffolk.—"I last autumn used 2 cwt. of your manure per acre on a piece of fen land; it came up very strong in plant, assumed a most healthy appearance during the winter, and has produced me one of the finest crops I ever grew."

Extract from the *Agricultural Gazette*, 7th April, 1855.—"The Nitro-Phosphate Company throw blood and bones together, and add sulphuric acid, thereby manufacturing a manure, which, as it contains soluble phosphate along with nitrogenous matter, is as nearly perfect, whether for roots or corn, as anything can ordinarily be."

Extract from the *Mark Lane Express*, of January, 1854.—"Amongst the new things which appeared this year for the first time was Odams' Patent Blood Manure; and it is this addition to our fertilisers which falls to our province to review. Blood has long been acknowledged one of the most enriching of all our manures, a proposition the soundness of which has been proved by innumerable experiments. Now that the startling fact has reached the ears of the agricultural public that Peru will be exhausted of Guano in a few years, surely the prospects of an everlasting supply at home will be accepted with some degree of national satisfaction, more especially since the latter is superior to the former in quality."

The Public are cautioned against spurious imitations; as security to the purchaser every Bag is marked "ODAMS' PATENT BLOOD MANURE," and sold only by the authorised Agents of the Company.

OFFICES, 109, FENCHURCH STREET.

Price 7*l.* 10*s.* per ton, free at any Railway or Wharf in London.

DIRECTIONS FOR USE.—From 2 to 4 cwt. per acre, according to the condition of the soil. It may either be drilled in with the seed or sown broadcast; if the latter it should be well harrowed in.

THE LANDS IMPROVEMENT COMPANY.—Incorporated by Act of Parliament, 1852—53, for England and Scotland, and further empowered by Amendment Act, 1854—55. To Landowners, the Clergy, Solicitors, Estate Agents, Surveyors, &c., Tenants for Life, Trustees, Owners in Fee, Incumbents of Livings, Bodies Corporate; Lessees for Lives renewable, or for a term of more than 25 years; (and Lessees for Lives not renewable, or for a term less than 25 years, with consent of their Lessors, &c., are enabled, by way of Loan from the Company, or by their own funds, to execute and charge on the Lands improved, by way of rent-charge for a term of 25 years, repaying capital and interest, the cost of every landed improvement, especially of Drainage, Irrigation, Warping, Embanking from the Sea, from Lakes, Rivers, or Streams, Inclosing any Land, or improving Drains, Streams, or Water-courses, Reclamation, Farm Roads, Clearing, Erection of Farm-houses and other Buildings required for farm purposes, and the Improvement of and Additions to Farm Houses, and other Buildings for Farm purposes already erected; Planting for Shelter and for Periodical Cuttings, Jetties or Landing Places on the Sea Coast or on the banks of navigable Rivers or Lakes in the Highlands and Islands of Scotland; Engines and Machinery for Drainage, Engine-houses for Farm Steadings, &c., Water-wheels, Tanks, Pipes, Water-courses, Bridges, Sluices, &c. The Plans of Buildings, Specifications and estimates are prepared by the Applicant's own Agents and are submitted to the approval of the Inclosure Commissioners' Inspectors who are also the sole judges of the due execution of the works. Proprietors may apply jointly for the execution of Improvements mutually beneficial,—such as a common Outfall—Roads through the District—Water power, &c. The Directors wish it to be understood that the Company is of a strictly commercial character, and that the details of the Plans and of the execution of the Works are not interfered with by them, but are controlled by the Landowner and by the Inclosure Commissioners. For further information and for Forms of Application, apply to the Honourable WILLIAM NAPIER, Managing Director, 2, Old Palace Yard Westminster.

CAUTION.

PARKES' STEEL DIGGING FORKS AND DRAINING TOOLS.

Whereas very inferior descriptions of Steel Digging Forks are now manufactured and sold, and I have been informed that purchasers of the same have believed them to be the same as those manufactured by me, and to which the Royal Agricultural Society and numerous Agricultural Societies' prizes have been awarded, I hereby respectfully inform the public that every Fork manufactured by me is stamped with my trade mark "J. P.," and that Messrs. BURGESS & KEY, of No. 103, Newgate Street, London, are my sole Wholesale Agents, and I have authorised them to replace to the purchaser every Fork of my manufacture found defective; they will also on application send Wholesale and Retail Price Lists, &c., post free. FRANCIS PARKES & Co.

ECONOMY OF FERMENTATION.

BUSHE'S PATENT ROOT GRATER, manufactured by FOWLER AND FRY, Temple Gate, Bristol, entirely supersedes the necessity of Cooking Turnips, Mangold, and other Roots; it effects a saving of 30 to 40 per cent. of the Roots, besides that of fuel. Price 3*l.* 10*s.* Printed testimonials and directions may be obtained gratis by applying to FOWLER & FRY, Bristol, Licensed Makers of CORNE'S Patent Chaff Cutters and General Agricultural Implement Makers and Dealers. The Root Grater may also be seen in the Agricultural Department of the Crystal Palace, Sydenham.

WARNER'S 4½-inch IMPROVED LIQUID MANURE PUMP,

with Ball Valve, fitted with 1½ inch Brass Union for attaching flexible suction, with strong wrought iron Straps for screwing on to any ordinary Water-butt or Cart, as shown in drawing.

Price of Pump and Union, 50*s.*

1½-inch Flexible Rubber and Canvas Suction for ditto, 3*s.* 6*d.* per foot.

1½ Gutta Percha Suction, 1*s.* 6*d.* per foot.

WARNER'S IMPROVED LIQUID MANURE, OR GENERAL PORTABLE PUMP.

The valve is a ball of imperishable material, and cannot clog in action. The barrel is of galvanised iron, not likely to corrode, and can be raised or lowered at pleasure. The legs will fold together, and the whole may be carried on shoulder to any pond or tank required.

Price of 4½ in. Pump, with legs, 3*l.* 3*s.* The barrel is 27½ in. long, and the legs are 5 ft. high.

1½ inch Gutta Percha Suction Pipe, 1*s.* 6*d.* per foot.

1½ inch Flexible Rubber and Canvas Suction Pipe, 3*s.* 6*d.* per foot.

May be obtained of any Ironmonger or Plumber in town or country, at the above prices, or of the Patentees and Manufacturers, JOHN WARNER & SONS, 8, Crescent, Jewin Street, London.

Every description of Machinery for Raising Water, by means of Wheels, Rams, Deep Well Pumps, &c.; also Fire and Garden Engines, &c.—Engravings sent on application.

WARNER'S PATENT VIBRATING STANDARD PUMPS.

PATENT CAST-IRON PUMPS, for the use of Farms, Cottages, Manure Tanks, and Wells of a depth not exceeding 30 feet.

Diameter of Barrel	Length of Barrel, under nose.		£	s.	d.
2½ in.	short 1 ft. 7 in.	Fitted for lead,	1	12	0
2½ „	long 3 „ 3 „	gutta percha,	1	15	0
3 „	ditto 3 „ 6 „	or cast iron	2	12	0
3½ „	ditto 3 „ 6 „	flanged pipe,	2	18	0
4 „	ditto 3 „ 6 „	as required.	3	5	0
2½ „	short, with 15 feet of Lead Pipe attached, and Bolts and Nuts ready for fixing		2	12	0
2½ in.	long ditto ditto	ditto	2	15	0

The short barrel Pump is very convenient for fixing in situations of limited height and space, for the supply of coppers and sinks in Wash-houses with soft water from underground tanks, or in Hot, Forcing, and Plant Houses; they may be fixed, when desired, under the stage.

May be obtained of any Ironmonger or Plumber in Town or Country, at the above prices, or of the Patentees and Manufacturers, JOHN WARNER AND SONS, 8, Crescent, Jewin Street, London.

Every description of Machinery for Raising Water, by means of Wheels, Rams, Deep Well Pumps, &c.; also Fire and Garden Engines, &c. &c.—Engravings sent on application.

ROYAL AGRICULTURAL COLLEGE, CIRENCESTER.

Patron—His Royal Highness Prince ALBERT.
President of Council—Earl BATHURST.
Principal—Rev. J. S. HAYGARTH, M.A.
Professors, &c.:—
Chemistry—J. A. C. VOELCKER, Ph.D., F.C.S.
Zoology, Geology, and Botany—JOHN BUCKMAN, F.G.S., F.L.S.
Veterinary Medicine and Surgery—G. T. BROWNE, M.R.C.V.S.
Surveying, Civil Engineering, and Mathematics—F. ARMSTRONG, C.E.
Manager of Farm—G. AUSTIN.

Students are admitted after the summer and winter vacations, also in April and October. The annual fees for boarders vary from 45 to 80 guineas, according to age and other circumstances. The fee for out-students is 40*l.* per annum. The College course of lectures and practical instruction is complete in one twelvemonth, although a longer course is recommended. There is a department for general as well as for agricultural purposes. Prospectuses and information can be had on application to the Principal.

COLLEGE OF AGRICULTURE AND CHEMISTRY, AND OF PRACTICAL and GENERAL SCIENCE, 37 and Lower Kennington Lane, Kennington, near London.

Principal—J. C. NESBIT, F.G.S., F.C.S., &c.

The system of studies pursued in the College comprises every branch requisite to prepare youth for the pursuits of Agriculture, Engineering, Mining, Manufactures, and the Arts; for the Naval and Military Services, and for the Universities.

Analyses and Assays of every description are promptly and accurately executed at the College. The terms and other particulars may be had on application to the Principal.

ARTIFICIAL MANURES, &c.—Manufacturers and others engaged in making ARTIFICIAL MANURES may obtain every necessary instruction for their economical and efficient preparation, by applying to J. C. NESBIT, F.G.S., &c., Principal of the Agricultural and Chemical College, Kennington, London. Analyses of Soils, Guanos, Superphosphates of Lime, Coprolites, &c., and Assays of Gold, Silver, and other Minerals, are executed with accuracy and dispatch. Gentlemen desirous of receiving instructions in Chemical Analyses and Assaying, will find ample facility and accommodation at the College.

DRAINAGE OF LAND.

MR. HUMBERT, of Watford, Herts, a practical Surveyor and Land-Agent of more than 15 years' standing, offers his services to Gentlemen about to drain Land and Bogs. He will undertake to set out and superintend himself the execution of the work at a charge of 5*s.* per acre, and the expenses incurred in his travelling; or he will contract to complete it in a specified manner to the satisfaction of the Inclosure Commissioners at a fixed price per acre. Mr. Humbert has drained strong stony land in the most careful and complete manner, with 1¾ inch pipes, and proper mains, the drains being 4 feet deep and 30 feet apart, at 4*l.* per acre and under, and he can give reference to his employers in that and in other instances.

Watford, Herts, Sept. 29

SMITHFIELD CLUB, 1855.—FAT CATTLE SHOW.—The ANNUAL CHRISTMAS SHOW of FAT CATTLE, SHEEP, and PIGS, will take place on the 11th, 12th, 13th, and 14th of December, 1855, at the Carriage Bazaar, King Street, Portman Square, when nearly 800*l.* will be awarded in Prizes and Medals.

The printed forms of Certificates, properly filled up, must be returned to the Honorary Secretary on or before SATURDAY, November 10th. Prize Sheets and the necessary printed forms of Certificates are now ready, and can be obtained on application to B. T. BRANDRETH GIBBS, Honorary Secretary, Corner of Half-moon Street, Piccadilly, London.

All communications on the Club's business should bear the words "Smithfield Club" on the outside.

The Agricultural Gazette.

SATURDAY, SEPTEMBER 29, 1855.

THE correspondence on REAPING MACHINES which our own and other agricultural papers have published during the past few weeks has been excited by the remark of a cotemporary in reference to the official report of the trials at Leigh Court last month. That report described the trial then conducted as "memorable in its immediate effects, and in the future results to which it will doubtless lead:" and the rejoinder of our cotemporary was that seeing the awards of the Society's prize had been every year to a different machine, the only result to which this last award could lead would be to throw discredit on the system of adjudication whose results had been so variable. The prize was awarded to Messrs. GARRETT in 1852 for HUSSEY's reaper; to Mr. CROSSKILL in 1853 for BELL's reaper; to Messrs. DRAY in 1854 for HUSSEY's reaper; and now to Messrs. BURGESS and KEY for M'CORMICK's reaper. Of course the successful competitors are anxious to maintain the character of the trial which has ended in their favour, and the *North British Agriculturist* gets well scolded by them for its criticism. We believe with them that the competition at Leigh Court was as real, as well contested, and as carefully superintended as any trial to which these machines have been yet subjected; and we believe that its result may be safely taken as a guide by purchasers of reapers; but we could have wished that the praise which is most probably its due had come from another pen than that of its official reporter. If ever doubts shall arise as to the trustworthiness of the Society's decisions, it will be on those occasions to which reporters for the public press are not invited. Our national agricultural societies will serve their purpose and their own interests more effectually by more cordially accepting the assistance, and admitting the usefulness and ability of the public press. Those who conducted the trials at Abbot's Leigh ought to have invited the attendance of reporters from every agricultural periodical in the country; agricultural readers would have been better pleased to hear the closeness of the contest borne witness to by indifferent specta-

tors. No doubt the gentlemen engaged in this adjudication may feel angrily surprised at the criticism which their earnest, able, and singleminded services encounter—they may rest assured, however, that it is just in proportion as their services count frank and full publicity that they will be either valuable or valued: their value depends on the public confidence reposed in them, which is never so readily accorded to a merely official report, however honestly it may have been prepared; and no other report, so far as we know, exists of the trials at Abbot's Leigh.

We believe that the English Agricultural Society will better attain its end when it shall require entire and immediate publicity for all such proceedings, whether of its council or any other of its office-bearers, as under present arrangements are intended for publication ultimately but only through the official channel. The lectures and discussions at its weekly meetings ought to be open to public reporters as well as to official ones—the interests of the annual Journal, which it is said would be compromised by this, ought to be as nothing in comparison with the interests of English agriculture which would be served. Our remarks cannot be taken as casting any doubt upon the ability and trustworthiness of the official reports of the Society: it is in the nature of things that exclusiveness begets want of confidence, and integrity and ability cannot hinder it.

To return to the reapers, we only add that probably the safest inference to be drawn from the varying decisions of the Society's judges is, that the differences in the merits of these machines are not so very great, and that when well managed any of them will make satisfactory work under favourable circumstances.

Having previously referred to the qualifications of a steam cultivator for light lands and friable loams, we will now consider the requirements of heavy clays, as indicated by the present methods of culture. The soils of the London clay, plastic clay, Weald clay, gault clay, Oxford clay, blue lias, the clays of the oolite and coal formations, chalk marl, and drift, are more or less stiff, adhesive, retentive of moisture, and intractable when either wet or dry—in the former state working up into soap or mortar, sticking to and rolling before the plough; in the latter condition hardening into cracked and fissured brick almost impenetrable by the ploughshare. Whilst two horses are sufficient for the tillage of 50 or 60 acres of friable soil, the same force is calculated to work only 25 acres of strong clay; not only because 3 or 4 horses are needed to pull a plough, but because a great amount of horse-power must be kept throughout the year in order to accomplish the whole cultivation during the few days in which the land is properly workable. The mechanical treatment of heavy land—rich in the mineral constituents of all crops—forms therefore the great point in its management; hence the wide scope for steam power upon the clays, and the possibility of its one day inaugurating a new agriculture upon them, transforming their tantalising fertility into garden-like productiveness.

Without saying anything at present about a better process than ploughing for turning the soil, we observe that the mere *gain in time* by substituting steam for horse power for performing the present tillage, would be of wonderful advantage to the clay farmer. Clay farming has continually the sort of hurry and fretting anxiety of hay-making in unsettled weather; but the trouble and cost entailed by adverse seasons would be little felt had we ample means for ploughing and cultivating our capricious and obstinate soil within the limited periods in which it is in fit order. Now, steam-power yoked to a plough or other implement (providing it worked efficiently), would supply this means. As a steam-horse never wearies, he will work many hours per day longer than an animal; the plough might thus be kept going "from morn to noon, from noon to dewy eve," and by a system of relays for the men accompanying it, might start with the first glimmer of dawn, and cease only when night darkened upon the field. But there is a still more important consideration; a farmer now keeps a full complement of horses through the entire year for only a few weeks' effective work—accomplishing then by a *coup de main* an amount of labour which a much smaller force could effect by every-day instalments. A steam-engine, however, has the advantage of not consuming food (as horses do), when resting between such spasmodic efforts of tillage; so that the same annual outlay of money at present required for horses would maintain a far more powerful engine than can be worked at the same daily expense as the horses. In other words, the farmer can not only afford to employ an engine, the daily expense of which (when at work) for fuel, oil, attendance, wear and tear, and interest of first cost, amounts to as great a sum as the food, attendance, deterioration, and interest of first cost of the horses; but he can afford to lay out *much more than this* upon an engine, because of its non-expensiveness when at rest. With a machine, therefore, able to do more work in a given time, and also to work more hours per day than his present horse-teams, the farmer would be in a great measure independent of flooding rains and hardening drought, yet without any greater expenditure of capital than he now annually incurs.

Inventors would confer an invaluable benefit upon the clay farmer by producing some engine capable of imitating (with improvements) the work of the plough, at the same working cost; only let them remember that the point of *expedition* is so important that the farmer can better afford to employ extra *power* than to spend longer *time* in obtaining superiority in the style of operation.

Upon clay land, the grubber or cultivator does not divide dominion with the plough, which, besides breaking up leas and stubbles, has to stir the summer fallow, turning it at least four, or at most eight times—first going very deep with immense labour, afterwards more shallow. Frequent heavy harrowings keep the ground moving; but always carefully preserve its rough cloddy condition. In some parts of Scotland, however, with a moister climate, the roller, harrow, and cultivator make the land fine at a certain period of the summer, so that root-weeds may be cleared off. Of course the cultivator, harrow, roller, and clod-crusher are used in preparing a tilth for all seedings.

The main requirement, then, is for an economical substitute for the plough; that is, *a powerful machine that can turn over the soil deeply and thoroughly without poaching and kneading it.* In the next place, there must be *a stirring implement almost as strong*, in order to perform the repeated division and exposure of rough fallow, together with all varieties of comminuting tillage pursued upon the farm; while the latter machine should be capable of working as *a subsoiler*, and the former as *a trenching tool*—these being some of the greatest necessities in the melioration of heavy land.

For thus operating upon the clays, the idea of a *travelling* steam-engine seems utterly preposterous: *lightness* being an indispensable condition of improved tilling machinery for such soil; while the necessarily rugged and precipitous surface of a fallow appears to be an impracticable road for a ponderous locomotive. Unless a motive power, incomparably lighter than a steam-engine, can be employed, the implements, heavy enough in themselves, should be actuated *by traction from a stationary engine*—which may be shifted from time to time upon a portable or perpetual tramway.

From this and previous articles it will be seen that we regard *two forms of digging or cultivating machine*, adapted to one engine, as sufficient either upon clays, loams, or light lands respectively; alike upon all soils, only differing in detail according to the nature of the material with which they have to deal. Upon light soils, too, we are prepared to continue the plough, modified to suit steam-power.

Our conclusions are based upon the present system of cultivation: whether or not a new order of tillage can be introduced by new mechanical inventions, we leave for future consideration. *I. A. C.*

ON FATTENING POULTRY.

(*Continued from p. 636.*)

Chapter II.—The Practice of Fattening.

Section I.—*Selection of Breed.*

In fattening poultry for the large markets, no success can be expected unless suitable varieties are selected; in fowls, as in other domesticated animals, some varieties are much more readily disposed to fatten than others, and one breed may be characterised by the tendency to accumulate fat internally, and another externally.

To those who have had extensive experience in the different breeds, there can be no question as to the best variety for table purposes. The coloured Dorking surpasses in this respect all other kinds; its superiority consisting in the large size it attains at an early age, in its short legs and compact form, in the fineness of its bones, and the small quantity of offal, in the quantity of flesh upon the breast, in the extreme whiteness and delicacy of the meat, and the readiness with which it fattens. The large Surrey fowls, which are only to be distinguished from the Dorking by the absence of the fifth toe, are equally valuable for table purposes.

The white Dorking, as at present known, is not to be strongly recommended, as it is evidently a distinct variety from the coloured; the size, carriage, and general form of the birds being dis-similar. The only drawback to the superiority of the Dorking consists in the delicacy of the breed when a chicken; this on heavy clay land or in damp situations is a serious evil. Under such circumstances many persons of great experience recommend crossing the breed, by having a large Malay or Cochin cock with Dorking hens, or a Dorking cock with Cochin or Malay hens; care being taken not to rear any of the cross-breed chickens for stock, but to fatten them all for the table. By this means greater hardihood and large size may be obtained; but the writer has never succeeded in rearing such chicken with the plump breasts and short limbs of the pure bred Dorking.

Should it be deemed desirable to cross the Dorkings for the purpose of producing a hardier fowl, such a plan as the following seems to offer the best chance of success, being based upon the fact, that in cross-breeding the pullets usually resemble the mother, and the cockerels the father:—Early in the year, so as to obtain a brood in May, put two or three large Dorking hens with a short-legged compact Cochin cock, either of the common buff or of the grey variety known as Brahma Pootras. From the chicken select those pullets possessing in the greatest degree the Dorking character—viz., having fine bone, short white legs, and compact body, square on the limbs—and in the following season mate these with a good Dorking cock. The progeny thus obtained from them will be three-fourths Dorking, and if care is taken in the selection, will show very little trace of Cochin blood; whilst the size and constitutional hardihood of the breed would be much improved by the infusion of new blood from the hardiest of races. One caution, however, would be requisite;—if these birds were allowed to breed amongst themselves, they would occasionally throw back to the Cochin; it would be therefore necessary to mate the pullets again with a Dorking cock, and, as in all cases of breeding for size and strength, great care must be taken to avoid breeding closely, viz., from birds related to each other.

Cochins, although of great weight, cannot be recommended as a profitable market fowl; their small breasts, yellow skin and fat, game-like flavour, coarseness of bone, and length of limb, being much against them; and it is almost impossible to render them fat upon the breast, as they have an unusual tendency to accumulate fat internally. It should be remembered that unless a fowl has naturally a full chest, it is impossible to put flesh or muscle on it by fatting; for there is this distinction between the flesh of quadrupeds and that of birds, that in the former the flesh can be increased in size by the intermixture of fat between the fibres, which gives rise to the marbled appearance seen in prime beef. This, however, cannot be done in the case of birds, their muscles being always destitute of fat which is deposited under the skin or in the interior of the body only.

Section II.—*Breeding.*

In rearing fowls for the market, the early treatment of chickens is of the highest importance; they should be warmly sheltered and housed, and moreover fed most liberally at very short intervals. If a chick receives a check in its growth at an early age, it never afterwards attains a large size, as the bony frame becomes set, and a stunted growth is the inevitable result.

With good and abundant feeding, and the advantage of a free run, in favourable weather Dorkings will become fit for the purpose of fattening at the age of three to four months in summer, and four to five or six in winter. In order to be in the highest perfection, fowls must be killed before they have arrived at their full development: the male birds should be taken when the sickle feathers of the tail begin to show, or, as the country women say, "when their tails begin to turn;" and the females, whilst still pullets—viz., before they have laid.

Section III.—*House, Coops, &c.*

The house in which poultry are fattened should be free from draughts of cold air, and kept at a moderately warm and uniform temperature; the roof, therefore, if of tiles, should be thickly lined with straw. Quietude being so especially desirable, it should be so situated as not to be accessible to those fowls at liberty, and it should be partially darkened, if possible. It is also important in the highest degree that it should be perfectly dry, as it is scarcely necessary to add that a fowl suffering from cold and inflammation is not likely to fatten.

The fatting coops should be 2 feet 6 or 8 inches high in front, and about 2 feet deep, with a boarded roof sloping backwards; the back and ends should be closed, and the bottom made of flat bars with rounded edges, 2 inches wide at the top, and narrower beneath, so as to prevent the dung sticking to the sides. These bars should run from end to end of the coop (not from back to front), and they should be 2 inches apart on the upper sides. The front of the coop should consist of rounded bars, 3 inches apart, and two rods connected together below, and sliding through holes made in the roof, will be found more secure than a door. Before the front should run a ledge to support the feeding troughs, which are best made by joining two pieces of wood at a right angle, and securing the ends by letting them into grooves in stout end pieces.

The fatting coops should stand on legs, to raise them a convenient height from the ground, so that the dung may be removed daily; the most scrupulous cleanliness must be observed, otherwise disease will be produced. The coops, therefore, should be frequently lime-washed with freshly slaked lime and water, and then thoroughly dried before a fresh batch of fowls are introduced. In cold weather the front should be covered up with matting, or some other warm material, at night.

The length of the coop must depend on the number of fowls that it is required to contain; but it is never advisable to place more than ten or a dozen together: and if strange fowls are put up, care must be taken that they agree well together, as otherwise the constant excitement would prevent their fatting.

It occasionally happens that fowls are infested with lice to such a degree that they become irritable, and refuse to fatten; in these cases, a little flour of brimstone dusted under the feathers before cooping them immediately expels the vermin.

(To be continued.)

THE PRIZE REAPING MACHINES.

WE have just observed in the *Mark Lane Express* of the 17th inst. an extract from a Scotch paper depreciating the value of our improvements in M'Cormick's Reaper, and questioning the decision of the Royal Agricultural Society in awarding to us the first prize at the recent trial at Abbot's Leigh. The best reply we think we can make is to produce the evidence of well-known practical farmers who have used our reapers this harvest, and we leave it to the public to decide between that and the remarks of perhaps a wholly unqualified critic. *Burgess & Key*, 103, *Newgate Street.*

"Princes Gate Farm, Havering Bower, Essex, Aug. 18, 1855.

"Gentlemen,—In reply to your inquiry, I am happy to inform you the reaper has very far exceeded my most sanguine expectation, particularly in the clean and correct mode of its cutting, gathering, and delivering, leaving the swarth in a most perfect form, very far better than could be done by the best workman I have ever seen.

"I commenced on 14 acres of Oats, and we cut them down at the rate of 1¼ acres per hour. I have this day cut down 11 acres of Wheat, commencing at 9 a.m. and finishing at 20 minutes to 5 o'clock; my horses travelled at the rate of 2½ miles per hour, and it was not harder work than their usual ploughing. The machine seems very simple, and not liable to derangement, nothing up to this time having caused us one minute's delay; we have not removed the knife or sharpened it, and from examination of the work, I am surprised to find it seems but little the worse for wear. I have 70 acres yet to cut, and I think it certain to finish the whole. Allow me to congratulate you on your spiral delivery—the motion is simple and effective, and without it, I consider the machine would be of but little use to agriculture. I think I have now answered your various inquiries, but I shall be happy to give you further information, as I proceed with the harvest, and you are quite at liberty to refer any gentleman to me you may think proper, to see it in operation during this harvest. Wishing you the success you so fully deserve, I remain, gentlemen, your obedient,

"Messrs. Burgess and Key. (Signed) COLLINSON HALL."

"Stanford le Hope.

"Dear Sir,—In reply to your inquiry respecting your self-delivery screw reaper supplied to Mr. Eve, I have cut about 30 acres of Wheat with it, but have not had an opportunity to ascertain the quantity of acres it will cut per day until this morning, when I went into a 6-acre field at 11 o'clock, and finished it by half-past 3 o'clock, which was a little more than 1¼ acres per hour. I may mention that I never changed the sickle, also that some of my best men said that they could not lay it so well with the scythe.—Yours truly,

"J. ROBERTSON,

"Messrs. Burgess & Key." "Bailiff for Mr. Eve."

And since then the following has been received from Mr. Hall:—

"Princes Gate Farm, Havering Bower, August 26, 1855.

Gentlemen,—I reply to yours of yesterday, I have continued reaping with your machine about 7 acres per day, that being about the quantity we could get tied up and trussed, but now, having more hands, we shall cut 10 acres per day for the next two days, which will finish my Wheat. All my friends and neighbours are truly astonished with the regularity of the work, and I am pleased to say we have not had one delay from anything breaking. You can refer any one to me; I can only say that the principle is admirable, and will in a very short time relieve the harvest field from its heaviest implement, the scythe. My men at first were much unsettled at the introduction of such an innovator on human toil, but they will soon view it in the proper spirit, and like the steam threshing machine, kind friends where they anticipated enemies.—I remain, gentlemen,

"Your obedient servant, COLLINSON HALL."

"Lazenby, Redcar, Sept. 21, 1855.

"Gentlemen,—Having had Messrs. Burgess and Key's Reaping Machine at work on my farm for several days and operating upon a variety of crops, I have much pleasure in expressing my entire satisfaction with its performances. I have cut autumn and spring sown Wheat varying from 32 to 40 bushels per acre, some much lodged, and Oats a very heavy crop, and so much laid and twisted in parts that I thought it utterly impossible for any machine to cut them at all. One pair of horses worked the machine easily day after day; they have to travel no faster than the ordinary ploughing pace, and a boy of 15 managed them without any difficulty. The machine is so constructed that there is very little wear and tear going on; it delivers the cut corn in a beautiful swathe laid so straight and lightly on the ground that the sheaves are quickly gathered up, the stubble is evenly cut and left particularly clean. I found that the machine will cut in the manner described from 1¼ to 1½ acres per hour; it is always cutting its full width, viz., 5 feet 8 inches. I have had great experience in reaping by machinery, and I can honestly say that Messrs. Burgess and Key's machine is on the whole by far the most perfect and satisfactory implement I have seen. (Signed) THOMAS PARRINGTON."

WARMTH CONFERRED BY DRAINAGE.*

A SERIES of six thermometers were placed in the soil, in different fields, at the depth of eighteen inches, and their indications were observed and compared, at stated hours of the day, by a qualified person, with thermometers placed in the air above ground; and as the observations were made in fields similarly situated, and over a series of years, they may fairly be compared together. The reason why the thermometers were placed as deep as 18 inches was, that at that depth they were found not to be sensibly affected by the changes of temperature in the atmosphere.

Observations were first made to ascertain the temperature of the ground in its natural state, in order to compare it with that of the same ground after being thorough-drained, and after being both thorough-drained and subsoil-trench-ploughed. The observations for each month of the year, for reasons formerly given, are classed into vegetating and non-vegetating periods, such periods being in unison with the state of the crops when growing, and with the state of the soil when in fallow. The temperature of the routine of the year by the month tells nothing in regard to its state in the period of vegetation. The thermometer in 1849 indicated the mean temperature of the ground of a field at Yester Mains, in its natural, wet, undrained state, as follows:—

Vegetating Season.	Mean.
March	36
April	40
May	48
June	54
July	55
August	56
September	59
October	35
Mean of the vegetating season	46°.75

Non-vegetating Season.	Mean.
November	34°
December	34
January	32
February	34
Mean of the non-vegetating season	33°.5
Mean of both seasons	42°.33

The mean temperature of the soil of another field at Yester Mains, after being thorough-drained, was as follows, in 1849:—

Vegetating Season.	Mean.
March	37
April	38
May	47
June	53
July	54
August	46
September	54
October	37
Mean of the vegetating season	45°.75

Non-vegetating Season.	Mean.
November	37
December	36
January	32
February	38
Mean of the non-vegetating season	35°.75
Mean of both seasons	42°.42

Here, in the same season, 1849, the temperature after thorough draining was one degree lower than in the undrained field in summer. Contrary as such a result may be to expectation, it may perhaps be accounted for from the circumstance of the difference of temperature being observed in different fields at the same time. It is quite possible for thorough draining to affect different sorts of subsoils, in a short time, to a different degree, as regards temperature. Had the thorough drained field been left to the effects of thorough draining alone for more than twelve months, it is probable that its temperature would have been higher than 45°.75 in the summer. This conjecture is corroborated by another field, where the temperature of the soil in summer was 45°.4, and where the thorough draining and subsoil-trench-ploughing were effected in the same summer. The thorough draining was executed in May and June, the subsoil-trench-ploughing in August and September, and Wheat was sown in October. The operations were thus hastened to improve the land as quickly as possible.

But another circumstance may have affected the summer temperature of the two fields first referred to, one being in bare fallow, the other in Grass in 1849. It is possible that the temperature of the subsoil may be differently affected by the state of the surface-soil, when it is covered with a crop or when it is in bare earth.

If we turn our attention to the temperature in winter, we observe quite another and more favourable result. The temperature in that season, in the same time, had risen no less than 2°.25. The mean of both seasons was rather higher after thorough draining. The advantage of a higher temperature in winter is of more importance in keeping the soil warm for vegetation than in summer.

The remarkable celerity with which thorough draining may affect the temperature of the surface soil was observed at Broadwoodside, in one instance, where a thermometer was placed 1 foot under the surface, on the crown of a ridge 18 feet wide, before a drain was cut on each side. The temperature observed was 48°; and after a drain had been cut to the ordinary depth on each side, in the open furrow of the ridge, the temperature rose to 49°.5—that is, 1½ degree in the course of six hours. The mean temperature observed after the soil had been thorough drained and subsoil-trench-ploughed in the first field mentioned above, was as follows, in 1850:—

Vegetating season.	Mean.
March	37°
April	39
May	42
June	54
July	59
August	54
September	55
October	50
Mean of the vegetating season	45°.75

Non-vegetating season.	Mean.
November	44°
December	39
January	32
February	36
Mean of the non-vegetating season	37°.75
Mean of both seasons	45°.08

Thus, in comparing the mean temperatures of the vegetating season, before and after thorough draining and subsoil-trench-ploughing the same subsoil, the advantage is 2° in favour of the deep-stirred subsoil; and in the non-vegetating season the advantage is as great as 4°.25. The higher temperature in the winter, let it be repeated, is the greater advantage, as it tends to equalise the temperature of both seasons; and equalisation of temperature in summer and winter is a decided characteristic of an improved climate. The mean temperature throughout the year was raised 2°.75 by thorough draining and subsoil-trench-ploughing. On comparing the relating effects of thorough draining with thorough draining and subsoil-trench-ploughing, on the temperature of the subsoil, it appears that thorough draining makes it warmer in winter to the extent of 2°.25; whereas the conjoined operations warm it 4°.25—that is, they nearly double the heat; and in summer the temperature is not raised at all by thorough draining, for the reasons given on a former page; while the addition of subsoil-trench-ploughing raises it 2°. It is thus seen to what extent subsoil-trench-ploughing confers benefit on the subsoil in raising its temperature both in summer and winter; and the joint operations warm the subsoil to a greater degree in winter than in summer, because of the superior influence of subsoil-trench-ploughing in completely pulverising the subsoil.

Thorough-drained and subsoil-trench-ploughed land is more quickly lowered in temperature by a fall of rain than undrained; but immediately on the rain ceasing, the temperature rises again as quickly in the drained soil, whereas it remains low for a long time in the undrained. On a series of nine thermometers placed in the soil 1 inch lower than the other, a considerable difference in the temperature was observed, in April 1850, on two thermometers; one placed 1 inch under the surface indicating 55°—the other, 4 inches, indicating only 49°. Below 4 inches the temperature of the atmosphere is found to have a very slow effect on the temperature of the soil. Thorough draining and subsoil-trench-ploughing first affects sandy soil and subsoil, then gravelly, then weak clay, and, last of all, adhesive clay. On all these subsoils the conjoint operations of thorough draining and subsoil-trench-ploughing have the same permanently beneficial effects.

The degree of warmth imparted to the subsoil by subsoil-trench-ploughing, small as it may seem to be, has the effect of melting the snow upon the surface soil in a short time, whereas thorough draining has not that effect. A striking instance of this difference was observed in a field, upon the one side of which, to the extent of 2 acres of Grass, which had been thorough drained but not subsoil-trench-ploughed, the snow lay every year; whereas upon the rest of the field, which had been both thorough drained and subsoil-trench-ploughed, it lay a comparatively short time. The very furrow which bounded the two conditions of the soil marked the line sharply between the snow and the bare surface. It may prove interesting to give the temperature of the soil of a south border of the kitchen garden at Yester in a high state of cultivation, as indicated by a thermometer placed 18 inches under the surface in 1849, as a means of comparing the temperatures of soils placed in an inclosed field of a farm, and within the walls of a garden.

Vegetating Season.	Mean.
March	42°
April	43
May	51
June	58
July	62
August	62
September	59
October	50
Mean of the vegetating season	53°.37

Non-vegetating Season.	Mean.
November	46°
December	41
January	43
February	53
Mean of the non-vegetating season	45°.75
Mean of both seasons	50°.83

The soil in the border was thus comparatively warmer in winter than in summer, as was found in the fields. On comparing the temperature of the soil in the fields, in the best condition, with that of the border in the same year in the vegetating season, the border has the advantage by 4°.62; but in the non-vegetating season it has the advantage to the remarkable extent of 8°; while, during both seasons, it has the advantage by 5°.75. A higher temperature of 8° in the subsoil in winter is equivalent to the influence of a very superior climate on the functions of plants, where it would support their life in the garden, while they would die in the fields. As it is the object of agriculture to approach as near as possible to horticulture in the treatment of plants, it thus appears that farming has yet much to do to place plants in the same favourable condition as does gardening. *Yester Deep Land Culture.*

Home Correspondence.

Steam Engines.—Permit me to call the attention of those who have steam engines to a volume entitled "C. W. Williams on the Combustion of Coal and the Prevention of Smoke," published by John Weale, High Holborn. I have derived so much practical benefit from its perusal, that I think it an agricultural duty thus to notice it. The author has long been managing director of the City of Dublin Steam Packet Company, and although the book is so modest in its title, it may really be called a profound theoretical and practical corrector of the enormous errors that most of us are committing in the manufacture of our boilers and the setting out of our flues, flame beds, and furnaces. I have re-arranged, at a trifling cost, the setting of my boiler according to figure 29 at page 66 of Mr. Williams's book, and have forthwith got a great increase of power, with economy of fuel and absence of smoke. The questions raised and proved in Mr.

Williams's book are of vast general importance to every department of steam power, substituting great and trustworthy principles for an ever-varying and costly experimentalism. I, for one, feel that we owe to this gentleman a great debt of thankfulness. One is no longer at the mercy of chance or caprice in this matter, and it is no longer difficult to account for cracked or broken boiler plates, damaged tubes and explosive accidents. The mere question of the circulation of the fluids inside the boiler suggests a host of improvements and reflections, and I can easily comprehend now why the vertical boiler attached to Romaine's digging machine lost its water by priming. We have been threshing for two days with an iron drum 3 feet 6 inches wide, having eight beaters, and making 1200 revolutions per minute. The quantity of water evaporated is fully 60 gallons per hour, or 10-horse power; the quantity of coal consumed 7½ cwt. in 12 hours, or 7 lbs. coal per horse per hour. Pressure of steam 50 lbs. per inch. I think that our Royal Agricultural Society should adopt a fairer mode of trying engines than is now practised. They are tried with Welch or anthracite coal, which is never used by farmers. If tried with bituminous coal instead of 4 or 5 lbs. per horse per hour 10 lbs. per horse per hour would be a nearer calculation, as shown on the farm. Our implement makers would do well to adopt Mr. Williams's suggestion, and admit air above the fuel by holes in the furnace door or by other means. I may trouble you in another communication with some remarks on the threshing machine. *J. J. Mechi, Tiptree Hall, Sept.* 24.

Steam Cultivator. — The difficulties which present themselves in constructing a locomotive steam plough, to do the ordinary work of the implement now in use, appear so numerous as almost to justify the expression impossible, when applied to the common tillage of a farm by such an invention. With our present knowledge of the means of generating steam, the machine, having to carry its own fuel and water, must be necessarily strong and cumbrous, quite unfit then to travel over stubble, or Grass land, to break it up, which is only the first process in cultivation; should this be overcome, the operation of pulverising would be hopeless. Four horses attached to a heavy harrow make indifferent work on a stiff soil after rain. If the weight of each animal is detrimental, what would be the result of many tons endeavouring to crawl over the fresh turned surface?—probably an entire failure, requiring the assistance of men and horses to extricate the mammoth plough from its immovable position. The bad state of farm roads is an important consideration when a constant change from field to field would be requisite; also the number of horses to move the engine, which when not occupied in this work would be idle, and might be better employed in subsoiling than gazing in wonder at a monster vainly trying to supersede their legitimate labour. The construction of a steam-cultivator may employ the ingenuity of our mechanists, and bring out hidden talent, but it is extremely doubtful as to a steam machine ever trotting over arable land, till some plan is discovered to enable the engineer to reduce its enormous weight and make it more manageable. To put a limit to the power of machinery would be absurd; or to suppose that a substitute may not yet be discovered for steam, better adapted to agricultural purposes, would be ridiculous, but until such a thing comes to pass, the tillage of the land had better be left to men and horses, with good ploughs, long forks, &c. *Falcon.*—— Is "I. A. C." to fail in making his "bold announcement" good? If so, it is only but fair to inform those of your readers who may be interested, but who like himself may not be able to comprehend the facts of the case, that your correspondent labours under a serious mistake when he says that Fisken's plough lessens "the strain upon the anchorages," for whatever may be the resistance on the plough side of the pulley, the power on the opposite must balance it. That power may be increased at a sacrifice of time and speed by any of the mechanical powers applicable; by pulley tackle, for example, "I. A. C." may run off at the gallop with the spare end of the rope, still the balance over the fulcrum must be sustained. Again, he is a very sober critic if he thinks that reaction can ever urge forward Usher's plough. A glance at facts will soon show this to be impossible, for the moment his ploughs enter the soil the unploughed land before them prevents their advance. In short, rotatory action and continuous progression is a mistake which "I. A. C." does not appear to see. In conclusion I am afraid your talented correspondent will find logic one thing and agricultural mechanics another. *W. B., London, Sept* 18.

Cobby's Clodcrusher.—It would appear by your notification of the clodcrusher which I sent you for insertion in the *Gardeners' Chronicle and Agricultural Gazette*, on the 20th ult., were it not contradicted, that it so resembles Mr. Crosskill's as not to require the assistance of drawings to show that there is no distinctive merit in my plan, whereas if you will be kind enough to compare drawings (annexed) of Mr. Crosskill's with mine, the difference must soon be seen—his discs are of two sizes, one being 3 inches larger than the other, and placed in centres one above the other. I ask, how can the large one effectually cleanse the small one, or *vice versâ?* My discs are of equal diameter, and the centres thereof placed horizontal must give a very different result. To you it appears the discs in my plan rise and fall, and the axle revolves; this is wrong, all the discs are on the soil at the same time, and travel at one speed, the axle is an ordinary one, and it does not revolve. I doubt not you will see that I am right in calling your attention to the error committed, and if the subject to you be worth correcting, such an acknowledgment would oblige. *Henry Cobby, 10, Walker Street, Hull.*

Reaping Machines.—Our farming friends may now safely give up the scythe, the sickle, and the bagging hook, except in a few cases of closely laid crops. For three years I have used Hussey's reaper (made by Garrett & Son); and although great improvements have since been made, it is economical in time and money as compared with manual labour. I completed a very heavy harvest on the 7th September, with my regular labourers only, and might have done so earlier, but wanted my horses for ploughing, so that the men had to cut 11 acres by hand. The early harvesting has enabled me to scarify all my Bean and corn stubbles and plough my land for Tares, although I only keep five horses on 170 acres, all arable. I will give my agricultural friends a hint how to render the reaping machines most acceptable to the labourers. In my case I let 9 acres (nearly all Wheat) to each man to cut, cart, and stack within the month for 5*l.* 5*s.* (about 11*s.* 6*d.* per acre). I then lent them the reaper, and during the whole harvest I have never heard a complaint of a bolt, screw, or nut being out of order, whereas, under other circumstances it never gave satisfaction. Practically six men could scarcely bind out of its way; indeed, had we cut the full width, it would have required eight binders, which I could not spare. Six binders can always bind as much as 12 to 14 reapers could cut, therefore the machine with three horses and three men did as much cutting as 12 to 14 reapers. My land is in 7 feet stetches with intermediate furrows, therefore not so favourable to the machine as level land. The time is fast coming when even little farmers will avail of abundant machinery. It was grievous to see a week or ten days' time lost in harvest by my neighbours as compared with myself, and yet in addition to this precious time a greater cost of money expenditure. The difference of centralised buildings, ready access, and the use of Hannam's carts instead of waggons, are agricultural economies that are gradually forcing themselves on the farmers' minds. I wish some of my agricultural friends would believe that I farm at less cost per quarter than they do; it would be a great help to their pockets. It is quite painful to see how much the harvest is delayed in many districts of this and other counties by undrained land, great hedge rows, timber trees, and worthless pollards, to say nothing of the superabundance of weediness, and absence of the horse hoe. Surely landlord and tenant must consider corn worth growing at present prices. *J. J. Mechi, Tiptree Hall, Sept.* 24.

Agricultural Statistics.—Give a corner of your Paper to an English farmer to enable him to exhibit his ideas on a subject in which the farmer is deeply interested—agricultural statistics. I have just laid down your Paper of the 24th inst. after perusing the evidence on that subject of Messrs. Maxwell and Caird, brother Scots probably, yet how unlike. The former evidently a man clearly comprehending all the difficulties with which he has to grapple, and exhibiting that comprehension in his clear and logical address.—To beget a confidence in the returns they must be made for small districts, by local resident agents, and must be spontaneous. Mr. Caird's short and pleasant method of compulsion would, in England at least, be ineffective. One man may lead a horse to the water, but 20 cannot make him drink. The farmers as a body are not apt at letters and figures, and therefore voluntary, and consequently satisfactory returns, must await that good time coming when the agricultural world shall come to a much greater extent than the present under the influence of the schoolmaster. In England, where so much of the land is held by yearly tenants, we have the additional difficulty arising from the frequent change of tenants. Again, how often does it happen that land after being sown is, for a variety of reasons, elemental or otherwise, ploughed and resown. My neighbours are now ploughing up portions of their Turnips. This would frequently happen after Mr. Caird's acreage returns were made, and with other causes which might be enumerated would, especially with unwilling hands, produce so much confusion and uncertainty, that the returns would be of little value. It is, however, evident that at present Mr. Maxwell's plan is beyond all comparison the more feasible. How difficult is it for the grower of a crop of corn himself to make anything like a correct return in time to be useful? In the most competent and willing hands and under the most favourable circumstances it could only be made approximative. How then is a stranger during a hasty visit to be more successful? *W. R. Carter, Pickhurst Green, Bromley, Kent, Sept.* 26.

[Mr. Carter must excuse our having cancelled that portion of his letter in which he has merely made a personal attack on one of whom it is obvious he knows very little indeed.]

Farmers' Clubs.

Padiham.—*The Peculiarities of English Agriculture.*—At the anniversary meeting of the Agricultural Society, Sir J. P. Kay Shuttleworth made the following remarks in proposing the health of "the Lord Lieutenant and Magistrates of the County," — The Lord Lieutenant and the majority of the magistrates of this county are great landowners, and as such they have great social duties to perform. In connection with associations such as the one which is assembled here to-night, they have duties of a nature deeply interesting to the members of such societies; and I think that associations of this character may be made chiefly useful, if we each, according to our ability, contribute that to the common stock of information which our opportunities best fit us to impart. My own acquaintance with agriculture is necessarily of a very limited nature. It is confined to those general improvements which are necessarily the function of the proprietor, such as the general drainage of estates, the improvement of farm buildings, and the introduction of those permanent means of advancement in the culture of the land, such as the means of storing liquid manure, and so on, which are properly the duties of a proprietor. I have also felt it my duty, as I know it has been the custom of some of the gentlemen who surround this table, to make myself well acquainted with those improvements in science which affect the progress of agriculture. I mean such knowledge as is conveyed by books. And there is in one direction an opportunity, which I have possessed of late years, owing to the necessity of foreign travel for the restoration of my health; for I have been enabled to bestow much time and a good deal of minute attention on a comparison of the systems of foreign agriculture with that of British. What occurs to me, therefore, in relation to that which is the object of our meeting to-night, and that which I may say calls upon me to speak as a duty as a magistrate and a proprietor in this county, is that which I can best do in connection with the objects of this meeting—that I should, in some very brief and general terms, without at all descending into minute and fatiguing statistics, give you a slight sketch of what appears to me to be the great features of contrast between foreign and British agriculture. Now, I am very happy to say, at the outset, that in many most important respects the agriculture of England has made, especially in the present century, an enormous advance over that of our foreign neighbours. That advance has been owing to the application of some very simple principles in the breeding of cattle and in the culture of the land, and to these I will endeavour to direct your attention, because I think we may learn even from our past successes, and from having a clear idea of what are the principles of progress that we have hitherto pursued, and which have given us a great advantage over our neighbours, in what directions our efforts may best in future be turned. In the first place, anybody who travels abroad will be greatly struck with the vast difference which exists in the breeds of cattle in the various countries of Europe. It is very common throughout the whole of Europe to employ the cattle to an immense extent for purposes of labour. Almost all the farm work is performed by oxen, and likewise a very large quantity of the carriage of the continent is performed by oxen, and not, as in this country, by horses. Even in the case of a gentleman's carriage, abroad, when it comes to the bottom of a very steep hill the relays at the bottom of the hill are not relays of horses generally but of a long team of oxen, which drag the carriage to the top of the hill at a very slow pace. Now there is one very great consequence of that which your own show to day will at once make you aware of—that it has been the great object in the breeding of cattle abroad to give great prominence to bone and strength, the means of labour, in preference to that which constitutes the great object of breeding in England, the smallness of bone, the early delicacy and precocity of the animal, the roundness of form, the bulk; and instead of great capacity of labour, such bulk as is a great hindrance even to locomotion. Now the way in which this great change in the character of the breeds of cattle in England during the last 80 or 90 years has been produced, has been by the principle of selection. Mr. Bakewell, with respect to the Leicester breed; the Elmans, with respect to the Southdown breed; and Mr. Collins, with respect to the Cheviot breed, have produced an immense change, for example, in the sheep of this country. They have produced sheep with great rotundity of form, with exceedingly small bone, with great weight, but with very small powers of locomotion; and the same principle has been applied to cattle, the short-horns, the Hereford breed, and the Ayrshire breed being all characterised by the same qualities of smallness of bone, the great bulk of carcase, and the large amount of meat that they will yield. In England, likewise, in reference to sheep, we have thought much more of the production of meat than wool; whereas in France and a large part of the continent, agriculturists have paid much more attention to the production of wool than of meat; and one of the consequences has been that, even in England, seeing that we have preferred the production of meat to that of wool, the carcase of the sheep has been much larger, and therefore the fleece has been much larger, and in England the value of the fleece has been on the average as great as in France, whilst the value of the meat in England is double the value of that in France. The breeds of sheep and cattle produced in England have not, as I said before, been calculated for endurance of labour, as they are on the continent; and, consequently, they have had little bone, but they have been also breeds of great delicacy. The principle of selection has been precocity of growth, the breeds of sheep and cattle, with one exception, arriving at their maturity in two years, and they are ready for the butcher at the end of two years; whereas the breeds of cattle in France and on the Continent generally are kept for many years for purposes of labour after they have arrived at the greatest growth. Therefore the whole consumption upon the farm for the maintenance of these cattle is simply expended in labour, and it was evidently a false economy which led the French

to suppose that, whilst they were having the advantage of the cattle for labour, they were also getting some advantage of them in meat; for after two years, with an animal properly selected for the purpose, there is no increase in bulk, and it is better to kill the animals. Now these principles, which are very simple—the principles of the selections of the breeds of cattle in England, are connected also with another very great change in England—that is, with the introduction of the rotation of crops; with the limitation of the extent of land applied to the purposes of growing corn; with the application of richer manures; with the keeping upon the land of the largest amount of stock, and therefore with the production of the largest possible amount of corn from the land. On the contrary, in France, and over almost the whole of the Continent, the plan of fallows still remains, the land is to a very great extent, very generally, much richer than that of England; there is a much larger extent of arable land, and it is land generally of a much more friable nature; and the climate in every respect better adapted to the success of agricultural operations, yet, owing to the introduction of the system of rotation of crops, to the keeping of a very large amount of stock upon the farm for the production of meat, and the application of these manures to a limited extent of arable land, the amount of corn produced on the same extent of land in England, as compared with the majority of countries on the Continent, is at least double, and in many cases treble, so that the much smaller extent of land produces the same quantity of corn. Now, the whole of these several operations singularly hang together. They are links of a chain of proceedings which can scarcely be dissociated, and it would be extremely difficult, I have often thought, for a French proprietor, in some remote part of France, to change the system upon which they are now proceeding, to introduce horses instead of cattle, and to feed his stock simply for the meat market. Even since they have introduced railways into France it would be very difficult for him to do it; and we certainly owe a very large amount of our success, at least of the rapidity with which we have introduced this system in this country, to the fact that we have markets so near at hand, that we have such a dense population; that we have such a little distance to carry our milk and butter especially, and that to a very large extent the farms of England can be dairy farms, and, where not so, can with such ease and advantage be meat farms. It would be more difficult to bring about this system in France; but so strongly are the thinking men of France convinced now of the great advantages of the system we pursue, that in the course of years I have no doubt whatever we shall see the English system rapidly introduced more and more over a great part of the Continent. You perceive that we have valued our cattle chiefly on account of the milk and the meat they produced, and we have discarded that which is the least valuable portion of the contribution that the animal can make to the wealth of the country, and that is its labour, in respect to cattle which are fed upon farms, and we have valued less the fleece of the sheep than we have the meat, and the result is that the whole moneyed produce of the farms in England, on the good farms, is nearly fourfold that of the same extent of land, even of better land in France. I connect these facts very much with the toast I have the honour to propose to you, and for this reason, that I think a very large part of the success of the agriculture of England has been owing to the good feeling which has subsisted between the proprietors and tenantry of the whole of England, to the extent to which the gentry of England have lived among their tenantry, and been ready to associate with them in such meetings as the present, and their readiness to pay close personal attention to the improvement of their estates; of which we had such noble examples as Mr. Coke of Norfolk, the late Lord Leicester, the present Duke of Bedford, and many others whose names I might enumerate as examples of a class of proprietors who have spent their time, fortunes, and talents which would have made them probably statesmen of the highest order, on the improvement of their estates and the welfare of their tenantry. I believe these results are to a very great extent owing to the attention the gentry have paid to the improvement of their estates, and likewise to the energy, skill, and enterprise of such men as Mr. Bakewell, the Elmans, and others, who have especially devoted themselves to the improvement of the different breeds of cattle in this country, and the introduction of right principles of culture. In connection with the toast, therefore, I think I am not introducing a subject foreign to the purposes of this meeting if I chiefly associate it with those duties which such gentlemen as the lord lieutenants and magistrates of counties have to perform upon their estates, in making great permanent improvements and in also cultivating right sentiments and proper associations for their tenantry. I do not think that sentiment, which is, I am afraid, somewhat gaining in this country, is a correct one, that the relations of landlord and tenant should be strictly confined to the mere terms of a bargain—that they should be reduced to the mere principle of self-interest. I do think that those associations which keep the tenantry connected through generations with a particular estate, which maintain sentiments of respect to the family to which that estate belongs, and confidence in the proprietor, are a happy part of our English constitution, and one of those features which we look in vain for abroad. One thing that strikes one's eye abroad very much is the extent to which the labour of women is introduced upon the land. That is owing to a very great number of circumstances which complicate the state of society abroad. You know that almost all the foreign countries have a system of conscription, or something equivalent to it, by which men are taken at a very early age to the army, where they acquire the habits of soldiers; and as they are taken early off the land, during their absence the women are obliged to labour on the land; and it is also owing to this subdivision of properties that the family has no chance of making a living out of the land unless the services of each member of the family, even the women, are given to its cultivation. The consequence is, that at the age of 45, or even at 40, the women are haggard, worn out with constant labour in the hot sun, from early morn to late at night, in the most laborious operations on the land. There is scarcely any kind of farm labour which they do not regularly perform; they hoe, they dibble, they weed; they even trench the soil, they load carts, and drive them; and from morning to night such labour as this forms their habitual occupation almost all over the continent of Europe. I think it is a very great advantage indeed to this country that that form of labour for women is rather the exception than the rule, and that even in the agricultural counties it is chiefly in harvest time, and to a certain extent in weeding and hoeing, but rather as the exception than the rule, that female labour is employed upon the land. There are a great many other features, as you will readily believe, of contrast between the English and foreign systems of agriculture, but I will not further intrude on your time than to say, that the result of several years of observation has been to congratulate myself—and I am very happy indeed to find my opinions and convictions are supported by the most recent labours of political economists, and of men of high science who have visited this and other countries—that the system of English agriculture is one which not only contributes in a much larger degree to the wealth of the nation than that of foreign countries, but that it also contributes in a much higher degree to social contentment, to the maintenance of healthy relations between tenants and proprietors, and to that happy constitution of society which makes, as I think, and as I trust foreign countries will also believe, the condition of England one to be envied by the rest of Europe.

Miscellaneous.

The late Professor J. W. F. Johnston.—It is with extreme regret that we announce the death of this great agricultural chemist. It is to the late Professor Johnston, more than any other man, that the acquaintance of English agriculturists with the scientific relations of their art is due. His contributions both to scientific and to popular literature have fed and fostered, and to a large extent created, that public interest in agriculture as a science, the earlier excitement of which was due to the pen of Baron Liebig. And it will be generally admitted that it is from his works, rather than from those of any other writer, that the agriculturist can most safely draw the lessons and the explanations which theory offers for his consideration. The following paragraph is taken from the columns of a cotemporary:—"The scientific productions of this gentleman have secured him an extensive reputation. On the continent and in America his works are as highly appreciated as at home. His attention was especially devoted to the cause of scientific agriculture; and, perhaps, no individual in this country has done more to substitute a system of enlightened cultivation for one of mere routine farming. His talents, however, were too versatile to expend themselves in one department of exertion. Among his other productions we may mention his "Notes on North America" and his "Chemistry of Common Life." The latter work is fresh in the memory of the public. It has shown what deep philosophy may exist in the plainest things, and that the humblest details of life abound in marvels, if there is only the "seeing eye" to detect, and the searching intellect to explore them. Independently of his writings, Professor Johnston was a remarkable man. He furnished another inspiriting example of the successes which energy and industry can always achieve. A more resolute and indefatigable individual has rarely lived. His death will be no small loss. His illness was somewhat brief. After spending the summer on the continent, he had scarcely set foot in England when he discovered from certain fatal symptoms that his lungs were affected, and, resigning himself to his lot with Christian submissiveness, he expired on the 18th inst. in the full vigour of his intellect." *Leeds Mercury.*

Notices to Correspondents.

CORRUGATED IRON OR ZINC ROOFING: *A known Correspondent* asks if any of our subscribers have had experience of these materials as coverings for farm buildings; and also what is the relative cost as regards their construction and the construction of similar ranges of buildings with tile roofs.

OATS: *J B Baker.* They are particularly liable to smut, more so than Barley, and very much more so than Wheat, as that seed is washed before sowing with a pickle, which destroys the germ from which the disease springs.

POND MUD: *S E.* The weather will not destroy its goodness, which does not depend verymuch on its volatile ingredients. It is better to let it drain, and then use the half-dried stuff in compost with farm-yard manure.

TURNIP CUTTERS: *Cor.* The prize man at Carlisle was Mr. Samuelson for Gardner's cutter.

WINTER BEANS: *C Clifton.* Broadshare the Wheat stubble, harrow it well, and burn the weeds. Plough the land then tolerably deeply, and harrow and burn weeds again; then cart on about 20 yards of dung per acre, spread, and plough and harrow, and then drill your Beans (2 bushels of the small winter Beans per acre) in rows 2 feet apart. Dung or guano are better than dissolved bones.

PRUNING.

THE GRECIAN PRUNING SAWS are universally acknowledged to be the best for every description of Pruning. They cut faster and cleaner than any other, and do not bend or break. Price 2s. 6d., 3s., and 3s. 6d. each.

THOMAS HILL, late W. Coleman, Cutler, 4, Haymarket, London.

PARKES' STEEL DIGGING FORKS & DRAINING TOOLS.

MESSRS. BURGESS AND KEY, as Mr. PARKES' Wholesale Agents for England, have always in stock a large assortment. These Forks and Tools are now in use by upwards of 1000 of the Nobility and Farmers, members of the Royal Agricultural Society, who pronounce them to be the best ever invented, and to facilitate labour at least 20 per cent. Price Lists sent free on application, and Illustrated Catalogue of the best Farm Implements, on receipt of eight postage stamps. 103, Newgate Street, London.

ROYAL AGRICULTURAL SOCIETY OF ENGLAND. MEETING AT CARLISLE, JULY, 1855.

FIRST PRIZE AWARDED TO

RICHMOND AND CHANDLER'S No. 3 B CHAFF MACHINE. Price £7.

All the various modern Implements of Agriculture manufactured on the most scientific and improved principles, suitable for home use and exportation.—Address, RICHMOND & CHANDLER, Salford, Manchester; and 32, South John Street, Liverpool.

☞ CATALOGUES GRATIS.

ROYAL AGRICULTURAL SOCIETY OF ENGLAND.

AT THE NORWICH, GLOUCESTER, LINCOLN and CARLISLE SHOWS,

The Prize for the best LINSEED and CORN CRUSHER was awarded to E. R. & F. TURNER, St. Peter's Iron Works, Ipswich.

E. R. & F. TURNER invite the attention of Agriculturists and others to the following machines of their manufacture:—

ROLLER MILLS for Crushing Linseed, Oats, Barley, Malt, &c., of various sizes, with or without Bean-mill combined. The numerous prizes awarded these Mills by the Royal and other agricultural societies, render comment on their merits unnecessary.

PATENT COMBINED GRINDING and CRUSHING MILL for reducing Barley, &c., to a fine and soft meal, and crushing Oats, Linseed, &c., is strongly recommended for the variety of purposes to which it is applicable, and for its perfect and economic working. Price 25l.

CHAFF CUTTERS, for horse or steam power, cutting three lengths, with facility for changing the length of the cut almost momentarily, and other valuable improvements.

OILCAKE BREAKERS, made entirely of iron, with case-hardened teeth suitable for all descriptions of cake. Price 3l. 10s.

FIXED STEAM-ENGINES, on the horizontal direct acting principle. Long experience and attention to the practical working of steam-engines of every variety, have enabled the manufacturers to offer these Engines as inferior to none—either for efficiency, economy, or durability—and at prices which will be found comparatively low.

Superior Portable Steam-Engines and Threshing Machines, Horse-Power Threshing Machines, Circular Saw Tables, One Horse Carts, and various other Implements, are also manufactured at the above Works.

Illustrated Price Lists sent free on application.

JAMES PHILLIPS & CO., 116, Bishopsgate Street Without, have the pleasure to hand their present prices of GLASS FERN SHADES AND STANDS.

Extract from The Cottage Gardener, *August 28th.*

"Fern Shades.—We have recently commenced a series of papers on the Ferns, and from the number of letters we receive on the subject, we know it is one which is highly popular with our readers. Many delight in seeing their beautiful Ferns introduced into the domestic circle; but without some such protection as these shades it would be impossible to preserve them. The shades of which we speak are glass cylinders with a domed top, which are placed on a glass pot wherein the Ferns have been planted, and they form, on a small scale, a pretty imitation of a Wardian Case."

GLASS FOR CONSERVATORIES, ETC.

HETLEY AND CO. supply 16-oz. SHEET GLASS, of British Manufacture, at prices varying from 2*d.* to 3*d.* per square foot, for the usual sizes required, many thousand feet of which are kept ready packed for immediate delivery.

Milled Sheet, White Lead, and Lead Pipe. Paints, Colours, and Varnishes, see Colour List, which can be had on application. Established more than 100 years.

GEORGE P. TYE'S Registered HYACINTH BOTTLES and FLOWER SUPPORTS are an age before all others for quality and utility. May be had everywhere retail and wholesale in great variety, from G. P. Tye, 107, Great Charles Street, Birmingham. All are carefully selected and marked G. P. Tye on the bottom of each article.

WARNER'S SWING WATER-BARROW (TO HOLD THIRTY GALLONS)

Is intended for all large Establishments where much watering is done by the watering-pot. By its use much time and labour of the Gardener are saved, particularly where the Tank, Pond, or Pump, is at a distance from the garden. May be obtained of any Ironmonger in town or country for 3*l.* 3*s.*

Manufactured by
John Warner & Sons, 8, Crescent, Jewin Street, London.

JOHN WARNER AND SONS, Crescent, Jewin Street, London.
GALVANISED IRON TUB GARDEN ENGINE,
With Warner's Registered Spreader,

is strongly recommended, for durability and low price, viz., 2*l.* 19*s.*, to hold 10 gallons.

Larger sizes in wood or iron, viz., 14 gals., 24 gals., & 35 gals. May be obtained of any Ironmonger or Plumber in town or country, or of the Patentees and Manufacturers, as also Machinery of all kinds for raising Water from any depth to any height by Steam, Horse, or Manual Power. Prices sent on application. Syringes of various constructions and sizes from 9*s.* upwards. Metallic String from 5*d.* to 1*s.* 3*d.* per lb.

TO AGRICULTURISTS AND OTHERS.

SIMPSON AND BARNES, Openshaw, near Manchester, beg to call the attention of parties requiring power to their PORTABLE and STATIONARY STEAM-ENGINES, from one-horse power and upwards, having the boiler and engine attached. They require no foundation, are simple and cheap, and are sent from the works ready to start when they arrive at their destination.

J. OVERALL begs to inform the Nobility, Gentry, Nurserymen, and others requiring Horticultural Buildings, Lights, and Frames, that by intrusting their orders to him, they may depend upon first-class workmanship and good materials at the most economical prices.

J. Overall, Horticultural Builder, 16, Shacklewell Lane, near Kingsland, London.

LANDSCAPE GARDENING, combining all the modern improvements in the CONSTRUCTION, BUILDING, HEATING, and VENTILATING HOT HOUSES, CONSERVATORIES, PINE PITS, and every other kind of Garden structure, by a practical Gardener and Horticultural Builder of 25 years' experience as Head Gardener to his Grace the late Duke of Northumberland, at Syon House, and her Majesty's Royal Gardens, Windsor, Kew, &c.—Designs and Estimates furnished for Garden embellishments on application to J. W. Thomson, F.L.H.S., Garden Architect, Exotic Nursery, King Street, Hammersmith.

BY HER MAJESTY'S ROYAL LETTERS PATENT.

E. DENCH, Patent Hothouse Works, King's Road, Chelsea.

These Patent Horticultural Buildings are superior to all others, wood being used for the frame work, but covered with Galvanised Iron Sashes, and all completed for 1*s.* 3*d.* per foot super. Hundreds of references can be given, and Printed Price Lists sent.

BY SPECIAL APPOINTMENT TO HER MAJESTY THE QUEEN.

WILLIAM WALKER, Victoria Foundry, Walmgate, York.

Manufacturer of Hot Water Apparatus for Heating Greenhouses, &c.
Garden Rollers, Handglass Frames
Iron Fencing and Gates
Liquid Manure Pumps
Iron Palisading, Iron Bedsteads
Galvanised Game Netting
Stable Packs and Mangers
Kitchen Ranges and Smoke Jacks on a superior principle

Every Description of Plain and Ornamental Cast and Wrought Iron Work.

HORTICULTURAL WORKS AND HOT-WATER APPARATUS MANUFACTORY, Kensal Green, Harrow Road, London.

JOHN TAYLOR AND SON beg to call the attention of the nobility and gentry to the very superior manner in which they Erect all kinds of Conservatories, Vineries, Greenhouses, &c., combining every improvement with elegance of design, and durability of materials and workmanship.

Their VENTILATING APPARATUS for the Fronts and Roofs of Houses has given the highest satisfaction. Churches, Chapels, Schools, Entrance Halls, Public Buildings, &c., heated with Hot-Water Apparatus in a most economical and efficient manner. J. T. & Son have great pleasure in referring to numbers of the nobility and gentry by whom they are extensively engaged.

HORTICULTURE IN ALL ITS BRANCHES.

JOHN WEEKS & Co., King's Road, Chelsea,

HOTHOUSE BUILDERS.

THE NOBILITY AND GENTRY about to erect Horticultural Buildings, or fix Hot-water Apparatus, will find at our Horticultural Establishment and Hothouse Works, King's Road, Chelsea, an extensive variety of Hothouses, Greenhouses, Conservatories, Pits, &c., erected, and in full operation, combining all modern improvements, so that a lady or gentleman can select the description of House best adapted for every required purpose.

The HOT-WATER APPARATUS, which passes through all the Houses and Pits affording both top and bottom heat, is in constant operation and particularly worthy of attention.

Many of the Houses and Pits are of wide and lofty dimensions, and together equal in length 1000 feet. They are all effectually heated by *one boiler*, which, during the severe winter months does not cost in labour and fuel more than 3*s.* 8*d.* per day, and the apparatus is so arranged that each House or Pit may be heated separately and to the required temperature. The splendid collections of Stove and Greenhouse Plants are also in the highest state of cultivation, and for sale at very low prices. Also a fine collection of strong Grape Vines in pots, from eyes, all the best sorts.

Plans, Models, and Estimates of Horticultural Buildings; also Catalogues of Plants, Vines, Seeds, &c., forwarded on application to John Weeks & Co., King's Road, Chelsea, London.

HEATING BY HOT WATER.

JOHN WEEKS & Co., King's Road, Chelsea, Horticultural Builders and Hot Water Apparatus Manufacturers. At our two Establishments horticultural science is fully carried out in all its branches.

The accompanying sketch represents our Improved Boiler. These Boilers are very powerful, durable, and economical. The whole of our extensive nursery establishment is heated by *one boiler*, measuring only 5 ft. by 3 ft. 6 in. The Houses heated consist of forcing-houses of various descriptions, many of them are of wide and lofty dimensions, in length 1000 ft., and exposing to the atmosphere upwards of 16,000 superficial feet of glass. During the late severe winter it only cost us 3*s.* per day for fuel, and we had more than a sufficient command of heat. Any number of forcing-houses can be heated by *one of our Boilers*, and any part regulated at pleasure. Plans, Models, and Estimates of Horticultural Buildings, or Heating by Hot Water, forwarded on application.

John Weeks & Co., King's Road, Chelsea, London.

NEW PATENT INVENTIONS FOR STABLE REQUISITES.

COTTAM AND HALLEN

HAVE made important additions to their original Invention of PATENT ENAMELLED MANGER RACK AND WATER TROUGH AT ONE FIXTURE, the main features of which are shown in the above engraving.

A *represents* the Patent Halter Guide and Collar Rein, the ball of which is taken to the back of the manger, works with ease and freedom up or down the guide bar, and is noiseless in its operation, as also a sure preventative against the most restive horse being cast in the stall.

B The Patent Portable Seed Box can be instantly detached from the Rack without disturbing the hay. The saving of the seed in a clean and useful state, either for agricultural purposes, or mixing with the food in the manger, is alone sufficient to claim general notice.

C The Seed Box detached, made of Galvanised Sheet Iron, light and durable.

D The Patent Saddle and Harness Bracket combined, can be used with great advantage in Harness Rooms, where space is an object, as the long portion of the bracket can be turned up out of the way when not in use.

COTTAM'S MANGERS are constructed in the best possible manner, both as to form and utility, are cleanly in appearance, durable, and impervious to infection; manufactured Plain, Galvanised, or Enamelled.

Improved Stable Guttering, with moveable safety covers, Sanitary Traps, Stable Pumps, Double Corner Mangers, Harness-room Appendages, and every article in Stable Furniture. Chaff Cutters and Oat Bruisers, kept on show at

COTTAM & HALLEN'S WORKS, 2, Winsley Street, Oxford Street, London.

WARMING AND VENTILATING.—Descriptive Catalogues and Estimates on application.

MAPPIN'S PRUNING KNIVES IN EVERY VARIETY, WARRANTED GOOD BY THE MAKERS.

JOSEPH MAPPIN AND BROTHERS, QUEEN'S CUTLERY WORKS, Sheffield; and 37, Moorgate Street, London. Drawings forwarded by post.

GALVANISED WIRE GAME NETTING, 6*d.* PER YARD, 2 FEET WIDE.

BARNARD AND BISHOP, Market Place, Norwich, in consequence of improvements in their machinery for the manufacture of the above article, have been enabled to make a great reduction in the prices.

	Galvanised.	Japanned iron.
2-inch mesh, 24 inches wide	6*d.* per yd.	4½*d.* per yd.
2-inch " strong, do.	8 "	6 "
2-inch " intermediate, do.	9½ "	7½ "
2-inch " extra strong, do.	11 "	9 "
1⅝-inch " 24 inches wide	7 "	5½ "
1⅝-inch " strong, do.	9 "	7 "
1⅝-inch " intermediate, do.	11 "	9 "
1⅝-inch " extra strong, do.	13 "	11 "

All the above kinds can be made of any width (under 8 feet), at proportionate prices. If the upper half is of a coarser mesh than the lower, it will reduce the prices one-fourth.

Strong Galvanised Poultry Netting, 10*d.* per yard; Galvanised Sparrow-proof Netting for Pheasantries, 3*d.* per square foot.

Illustrated Catalogues and Patterns forwarded by post. Delivered free of expense in London, Peterborough, Hull, or Newcastle. Manufacturers of Improved Strained Wire Cattle and Deer Fencing, Iron Hurdles, &c.

LIGHT, CHEAP, and DURABLE ROOFING.—CROGGON'S PATENT ASPHALTE ROOFING FELT is perfectly impervious to rain, snow, and frost, and has been tested by a long and extensive experience in all climates. Saves half the timber required for slates. Can be laid on with great facility by farm servants or unpractised persons. Price 1*d.* per square foot. CROGGON'S Patent Non-conducting Felt, for covering steam boilers and pipes, saves 25 per cent of fuel. Samples and testimonials sent by post, on application to CROGGON & Co., 2, Dowgate Hill, London, who also supply ship-sheathing felt and inodorous felt, for damp walls, and lining iron houses, and roofs generally, to equalise the temperature.

SOUND AND WHITE TEETH are not only indispensably requisite to a pleasing exterior in both sexes, but they are peculiarly appreciated through life as a blessing highly conducive to the purposes of health and longevity. Among the various preparations offered for the purpose,

ROWLAND'S ODONTO, or PEARL DENTIFRICE,

stands unrivalled in its capability of embellishing, purifying, and preserving the teeth to the latest period of life. Prepared from Oriental herbs with unusual care, transmitted to this country at great expense, this unique compound will be found to eradicate all tartar and concretions, and impart a pearl-like whiteness to the enamelled surface, remove spots of incipient decay, render the gums firm and red, fix the teeth firmly in their sockets and, from its aromatic influence impart sweetness and purity to the breath. Price 2*s.* 9*d.* per box. Caution.—The words "Rowlands' Odonto" are on the label, and "A. ROWLAND & SONS, 20, Hatton Garden," engraved on the Government stamp affixed on each box. Sold by them, and by Chemists and Perfumers.

DO YOU WANT LUXURIANT HAIR, WHISKERS, &c.?—ROSALIE COUPELLE'S CRINUTRIAR is guaranteed to produce Whiskers, Moustachios, &c., in a few weeks, and restore the Hair in baldness from whatever cause, strengthen it when weak, prevent its falling off, and effectually check greyness in all its stages. For the nursery it is recommended by upwards of 100 physicians, for promoting a fine healthy head of hair, and averting baldness in after years. Sold by all Chemists, price 2*s.*, or sent post free on receipt of 24 penny stamps, by Miss COUPELLE, 69, Castle Street, Newman Street, Oxford Street, London. Mrs. CARTER writes, "My head, which was bald, is now covered with new hair." Mrs. REEVE—"My hair is gaining strength and thickness." Sergeant CRAVEN.—"Through using it I have an excellent Moustache." Mr. YATES—"The young man has now a good pair of whiskers. I want two packets for other customers."

ASTROLOGY.—Persons residing in London or elsewhere can send their Address, Christian and Surname, and Age, in a letter containing 13 postage stamps, to Professor MELVILLE, Princes Road, Lambeth, London (the only Acrostic Astrologer in the universe), and they will receive as soon as possible, special poems on their names, in which their Destinies will be revealed.

DEBILITY AND NERVOUSNESS.—Encouragement to those in despair, and suffering from debility, spermatorrhœa, relaxation, nervousness, and exhaustion of the system. Advice and prescriptions, with a treatise on these diseases, for a successful course of self-treatment, by which a permanent cure of the most protracted case is effected, sent post free upon receipt of 14 postage stamps, by E. J. ROBERTS (late Army), Surgeon, 9, North Terrace, Moor Edge, Newcastle-on-Tyne.

COLDS, COUGHS, ASTHMA, INFLUENZA, and DISEASES of the CHEST and LUNGS, arise chiefly from alternations of Temperature. Painful and troublesome as these diseases are, they may be speedily and effectually removed by the judicious use of

SPENCER'S PULMONIC ELIXIR.

SPENCER'S PULMONIC ELIXIR is admirably adapted to promote expectoration, ease the breathing, loosen the phlegm, abate fever, and allay the tickling sensation which occasions the cough, without tightening the chest; and for all temporary and local affections—such as wheezing, irritation of the throat, palpitation of the heart, hoarseness of the voice, influenza, &c.—it affords immediate relief. While in more chronic disorders, as periodical coughs or inveterate asthma, it is equally valuable in its effects, although, of course, a longer perseverance in the use of the article is required.

*** Ask for SPENCER'S PULMONIC ELIXIR.

Prepared only by T. Roberts & Co., Crane Court, Fleet Street, London; and sold wholesale and retail by E. Edwards, 67, St. Paul's Churchyard; Barclay & Sons, 95, Farringdon Street; Sutton & Co., 10, Bow Churchyard; Hannay & Co., 63, and Sangar, 150, Oxford Street, London; and by all respectable Chemists and Medicine Vendors in the Kingdom. In bottles at 1*s.* 1½*d.* and 2*s.* 9*d.* each. *** The bottles at 2*s.* 9*d.* contain nearly as much as three small ones.

BASS'S EAST INDIA PALE ALE, BASS'S MILD BURTON ALE, and BARCLAY'S PORTER and STOUT, in 18-gallon Casks. Bottles, Half-Bottles, and Imperial Pints.—BERRY, BROTHERS, & Co., 3, St. James's Street, London.

SISAL CIGARS, SISAL CIGARS, SISAL CIGARS!

GOODRICH'S CIGAR, TOBACCO, AND SNUFF STORES (Established 1780), 416, Oxford Street, nearly opposite Hanway Street. A Box, containing 14 fine Sisal Cigars for 1*s.* 9*d.*; post free for 27 stamps. None are genuine unless signed "H. N. GOODRICH."

FRENCH MODERATOR LAMPS.—A very large and superior stock now on sale at DEANE, DRAY, AND CO.'S (Opening to the Monument), London Bridge.
Established A.D. 1700.

AT MR. MECHI'S ESTABLISHMENTS, 112, Regent Street, 4, Leadenhall Street, and Crystal Palace, are exhibited the finest specimens of British manufactures in Dressing Cases, Work-boxes, Writing Cases, Dressing Bags, and other articles of utility or luxury. A separate department for Papier Maché Manufactures and Bagatelle Tables. Table Cutlery, Razors, Scissors, Penknives, Strops, Paste, &c. Shipping orders executed. Superior Hair and other Toilet Brushes.

212° MILNER'S HOLDFAST AND FIRE-RESISTING SAFES (non-conducting and vapourising), with all the improvements, under their Quadruple Patents of 1840-51-54 and 1855, including their Gunpowder Proof Solid Lock and Door (without which no Safe is secure), the STRONGEST, BEST, and CHEAPEST SAFEGUARDS EXTANT.

MILNER'S Phœnix (212°) Safe Works, Liverpool, the most complete and extensive in the world. Show Rooms, 6 and 8, Lord Street, Liverpool. London Depôt, 47A, Moorgate Street, City.
Circulars free by post.

FENDERS, STOVES, AND FIRE-IRONS.—Buyers of the above are requested, before finally deciding, to visit WILLIAM S. BURTON'S SHOW ROOMS, 39, Oxford Street (corner of Newman Street), Nos. 1, 2, and 3, Newman Street, and 4 and 5, Perry's Place. They are the largest in the world, and contain such an assortment of FENDERS, STOVES, RANGES, FIRE-IRONS, and GENERAL IRONMONGERY as cannot be approached elsewhere, either for variety, novelty, beauty of design, or exquisiteness of workmanship. Bright Stoves, with bronzed ornaments and two sets of bars, 2*l.* 14*s.* to 5*l.* 10*s.*; ditto, with ormolu ornaments and two sets of bars, 5*l.* 10*s.* to 12*l.* 12*s.*; Bronzed Fenders complete, with standards, from 7*s.* to 3*l.*; Steel Fenders from 2*l.* 15*s.* to 6*l.*; ditto, with rich ormolu ornaments, from 2*l.* 15*s.* to 7*l.* 7*s.*; Fire-irons from 1*s.* 9*d.* the set to 4*l.* 4*s.* Sylvester and all other Patent Stoves, with radiating hearth plates. All which he is enabled to sell at these very reduced charges,

1st,—From the frequency and extent of his purchases; and,
2dly,—From those purchases being made exclusively for cash.

THE PERFECT SUBSTITUTE FOR SILVER.—The real NICKEL SILVER, introduced 20 years ago by WILLIAM S. BURTON, when PLATED by the patent process of Messrs. Elkington & Co., is beyond all comparison the very best article next to sterling silver that can be employed as such, either usefully or ornamentally, as by no possible test can it be distinguished from real silver.

CUTLERY WARRANTED.—The most varied assortment of TABLE CUTLERY in the world, all warranted, is on sale at WILLIAM S. BURTON'S, at prices that are remunerative only because of the largeness of the sales. 3½-inch ivory-handled table knives, with high shoulders, 11*s.* per dozen; desserts to match, 10*s.*; if to balance, 1*s.* per dozen extra; carvers, 4*s.* per pair; larger sizes, from 19*s.* to 26*s.* per dozen; extra fine, ivory, 32*s.*; if with silver ferrules, 37*s.* to 50*s.*; white bone table knives, 7*s.* 6*d.* per dozen; desserts, 5*s.* 6*d.*; carvers, 2*s.* 3*d.* per pair; black horn table knives, 7*s.* 4*d.* per dozen; desserts, 6*s.*; carvers, 2*s.* 6*d.*; black wood-handled table knives and forks, 6*s.* per dozen; table steels, from 1*s.* each. The largest stock in existence of plated dessert knives and forks, in cases and otherwise, and of the new plated fish carvers. Also a large assortment of Razors, Penknives, Scissors, &c., of the best quality.

WILLIAM S. BURTON has TEN LARGE SHOW ROOMS, devoted to the show of GENERAL FURNISHING IRONMONGERY (including Cutlery, Nickel Silver, Plated and Japanned Wares, Iron and Brass Bedsteads and Bedding), so arranged and classified that purchasers may easily and at once make their selections.

Catalogues, with engravings, sent (per post) free. The money returned for every article not approved of.

No. 39, Oxford Street (corner of Newman Street); 1, 2, and 3, Newman Street; and 4 & 5, Perry's Place.

TO NURSERYMEN AND OTHERS.

IPSWICH CEMETERY.—The BURIAL BOARD for the BOROUGH OF IPSWICH are prepared to receive TENDERS for PLANTING to be done in their Cemetery during the present autumn. Forms of Specification with Schedules, and quantities may be obtained on payment of 5*s.* for each copy, on application at the Offices of the Board, in the Woodbridge Road, Ipswich, and at the office of Mr. DAVIDSON, Landscape Gardener, 36, Great Russell Street, Bedford Square, London.—Ipswich, September 29.

TO NURSERYMEN AND FLORISTS.

TO BE LET, three miles from Oxford Street, situated in the main road, a respectable and convenient DWELLING HOUSE, containing six rooms, washhouse, and stabling; half an acre of good Land, with a small Greenhouse, suitable for a show-house, situated in an improving neighbourhood for jobbing. Would suit a young beginner well. Terms moderate.—For further particulars inquire of Mr. WHITE, Wheatsheaf Tavern, New Road, Shepherd's Bush.

FLORIST'S BUSINESS.

TO BE SOLD, the NURSERY GROUND, GREENHOUSES, &c., of the late Mr. HENRY GROOM, at Clapham Rise, Surrey, in consequence of his death, and the GOODWILL of the well-established BUSINESS to be disposed of. The Premises (exclusive of a strip of land held rent free, subject to six months' notice) comprise 3¼ acres, and are held at the low yearly rent of 80*l.* for an unexpired term of 36 years from Michaelmas, 1855. The House adjoining, late in the occupation of Mr. Groom, is not comprised in the lease, but may be rented. The Tulips and other Bulbs and Roots not in the Ground will be sold by auction on the premises in October next, the particulars of which are in preparation, and due notice will be given of the time of sale. The Premises may be viewed on application, and further information obtained of Messrs. PROTHEROE & MORRIS, American Nursery, Leytonstone, Essex; and of Messrs. BARNES & BERNARD, Solicitors, 2, Great Winchester Street, London.

TO BE LET, A NURSERY AND SEED BUSINESS.—JOHN YOUNG begs to say that he is desirous of treating with a Tenant for his Nursery Ground, which he is at present occupying himself, and which offers an eligible opportunity to any one wishing to enter on the business. The stock is light, and the quantity of land may be made to suit the convenience of the Tenant.—For further particulars apply to JOHN YOUNG, Elm Cottage, Taunton.

CARDIGANSHIRE.

TO BE LET, and entered upon immediately, a highly improvable FARM of about 280 acres of Arable, Meadow, and Pasture Land, with an excellent newly built Dwelling House fit for the occupation of a family of respectability. The Estate is called Wstrws, and situate at Capel Cynon, about seven miles from Newcastle Emlyn and the same distance from the thriving port of New Quay. It is well watered, having a brook running through it, and slopes for the most part towards the south. In addition to an excellent Dwelling House just about finished, there is a Cottage and Garden (let at 3*l.* 10*s.* a-year), and the fair tolls of Capel Cynon Fair, held twice a year, are received by the tenant, worth from 5*l.* to 10*l.* annually. The property offers great advantages to an experimental farmer with capital and application. Rent, in its present state, 100*l.* per annum; the proprietor would make further permanent improvements to suit a tenant on having a moderate return for the outlay. The Dwelling House contains on the ground floor two excellent Sitting Rooms 18 feet by 14 each, Study, Kitchen, and Offices, with Six Bedrooms over, and all conveniences for a respectable family. A long lease would be granted to an approved tenant, and more land might be obtained on moderate terms, with the right to shoot over about 800 acres. The neighbourhood is good, the Tivy side and Bwnwydd hounds meet in the neighbourhood very frequently. It is expected that the estate will be greatly increased in value on the extension of the railway from Carmarthen to Llandysil and Cardigan, for which an act has been obtained. The present lessee John Price Hutton, Esq., Glanyrafon, near Llandysil, Cardiganshire, will show the property on an appointment being made with him; and for further particulars apply to Thomas Davies, Esq., Solicitor, Cardigan; or Messrs. Henderson, Howard, and Wilcocks, Solicitors, 50, Broad Street, Bristol.

SHORT-HORNED BULLS.

TO BE SOLD, at Esholt Hall, near Leeds, three 1-year-old and one 3-year-old BULLS, all of pure Short-horn breed, the property of W. R. C. STANSFIELD, Esq.—For Pedigrees and particulars apply to JAMES M'KELVIE, Esholt Hall.

Sales by Auction.

STOVE AND GREENHOUSE PLANTS.

MR. J. C. STEVENS will sell by Auction, at his Great Room, 38, King Street, Covent Garden, on TUESDAY, Oct. 9th, at 1 o'clock precisely, a Collection of STOVE and GREENHOUSE PLANTS, including many fine specimens and some choice Camellias and Azaleas, well set with bloom, and a few Orchids.—May be viewed on the day prior, and catalogues had of Mr. J. C. STEVENS, 38, King Street, Covent Garden.

ORANGE ROAD, BERMONDSEY.

To NOBLEMEN, GENTLEMEN, AND PINE GROWERS.

MR. W. T. ATTWOOD will Sell by Auction, on the premises, without the least reserve, the extensive stock of healthy PINE PLANTS, principally Queens, together with the various Ranges of Graperies and Forcing Pits, also the whole of Hot-Water Apparatus, comprising about 1500 feet of pipe and three large Boilers. The above property is in good condition, and offers a valuable opportunity to persons requiring Pine Plants and Forcing Houses. The sale will take place about the end of October.

GREAT SALE OF NURSERY STOCK, AT THE NURSERIES, COVENTRY.

BROWN AND SON have received instructions from Mr. Ogden, who is clearing about five acres of ground, to Sell by Auction, on MONDAY, the 8th of October next, and following days, at 11 o'clock, about 200,000 TREES and SHRUBS; comprising a general assortment of Weeping Trees, fine large Evergreens, Ornamental, Flowering, Forest, and Fruit Trees. A large Collection of GREENHOUSE and STOVE PLANTS, consisting of Camellias, Ericas, Azaleas, &c. &c.—Catalogues may be had on application upon the Premises, and of the Auctioneers, or will be sent by post on application.

FULHAM.

LOCKHART'S ANNUAL SALE OF BULBS AND FLOWER ROOTS.

TO NOBLEMEN, GENTLEMEN, NURSERYMEN, AND OTHERS.

MESSRS. PROTHEROE AND MORRIS will Sell by Auction, on the premises, Parson's Green Lane, Fulham, on MONDAY, October 15th, at 11 o'clock, without reserve, a costly and extensive collection of BULBS and FLOWER ROOTS, being about 50,000 in number, and consisting of all the approved Hardy and Ornamental varieties of Hyacinths, Early and Late Tulips, Crocus, Narcissus, Anemonies, &c., in good condition; also 4000 Sir Charles Napier Ranunculus, the finest variety yet raised; with a collection of Herbaceous Plants, and sundries.—May be viewed three days prior to the sale; Catalogues had, 6*d.* each, returnable to purchasers, of the principal Seedmen in London, and of the Auctioneers, American Nursery, Leytonstone, Essex.

HACKNEY.

To GENTLEMEN, NURSERYMEN AND OTHERS.

MESSRS. PROTHEROE AND MORRIS are directed by Messrs. Brown and Taylor to Sell by Auction, without reserve, on the premises, Hackney Nursery, Dalston Lane, Middlesex, on THURSDAY, October 11, at 12 o'clock precisely (in consequence of the number of lots), the whole of the NURSERY STOCK: comprising Ornamental, Fruit, and Forest Trees; Evergreens and Deciduous Shrubs; also the Greenhouse Plants consisting of large specimen Camellias, Azalea indica, well set with bloom buds, Acacias, Cytissus, Myrtles, Deutzia gracilis, Forsythias, &c.; together with two Greenhouses, Pits, two and three Light Boxes, a quantity of Hot-Water Pipe, Boilers, Wheelbarrows, 200 feet Stove Shelvings, capital Nest Seed Drawers, Counter, Garden Tools, and sundry effects.—May be viewed prior to the sale; Catalogues may be had on the premises; of the principal Seedsmen in London; and of the Auctioneers, American Nursery, Leytonstone, Essex.

CLARENDON NURSERIES, CAMBERWELL.

MESSRS. PROTHEROE AND MORRIS are instructed by Mr. Joseph Fryer to submit to public competition on the above premises, on the 8th, 9th, and 10th days of October, at 11 o'clock each day, a portion of his extensive Nursery Stock, consisting of fine Standard and Dwarf Trained and Untrained Apple, Pear, Plum, Cherry, Peach, Nectarine, Apricot, Fig, Raspberry, Gooseberry, Currant, &c.; 2000 Mulberries, the finest stock in the trade, 4 to 10 ft.; 3000 Limes, 6 to 10 ft.; 4000 Lilacs of all sorts, 3 to 10 ft.; 2000 Evergreen Oaks, 2 to 5 ft., 4000 Evergreen Privet, 3 to 6 ft.; also large quantities of Scarlet, White, and other Rhododendrons, Azaleas, Andromedas, Magnolias, and other varieties of American Plants; Garryas, Glycines, Clematis, Passion Flowers, Bignonias, Virginian Creepers, Ivies, Box, Laurels, Althæas, fine large Elms, Lombardy and Balsam Poplars, Acacias, Scarlet Thorns, fine strong Seakale, &c. &c.—May be viewed prior to the sale, and Catalogues may be had on the premises, of the principal Seedsmen, and of the Auctioneers, American Nurseries, Leytonstone, Essex.

370, Oxford Street; and Garden Entrance, Crystal Palace, Sydenham.

CARSON'S ORIGINAL ANTI-CORROSION PAINT, specially patronised by the British and other Governments, the Hon. East India Company, the principal Dock Companies, most public bodies, and by the nobility, gentry, and clergy, for out-door work at their country seats. The Anti-Corrosion is particularly recommended as the most durable out-door Paint ever invented, for the preservation of every description of Iron, Wood, Stone, Brick, Compo, Cement, &c., work, as has been proved by the practical test of upwards of 60 years, and by the numerous (between 500 and 600) testimonials in its favour, and which, from the rank and station in society of those who have given them, have never yet been equalled by anything of the kind hitherto brought before the public notice.

Lists of colours, prices, together with a copy of the testimonials, will be sent on application to WALTER CARSON & SON, 9, Great Winchester Street, Old Broad Street, Royal Exchange, London. No Agents. All orders are particularly requested to be sent direct.

PAXTON WORKS, SHEFFIELD.

SAYNOR AND COOKE, Manufacturers of the celebrated Exhibition Prize PRUNING, BUDDING, and GRAFTING KNIVES, VINE and PRUNING SCISSORS, &c. These articles are Warranted to stand any kind of work, and to carry the keen edge of a razor without requiring to be sharpened so frequently as is usually necessary to obtain that sharp edge so requisite for the comfort and use of the practical gardener. The blades are also warranted to wear through to the back. They are used by all the eminent gardeners in England, Ireland, and Scotland, and can be purchased of any nurseryman or seedsman in the three kingdoms. Those who may not have used them are respectfully solicited to give them a trial. The Great Exhibition Prize Medal of 1851, and the Prize Medal of the Horticultural Society of Manchester, at their Show of 1854, was awarded to SAYNOR & COOKE for their superiority of material and workmanship. Established 1738.

HOSE PIPING.

WAITHMAN'S PATENT FLAX HOSE PIPING will sustain a greater pressure, is lighter, less bulky, will wear longer, and is about 60 per cent. cheaper than the leather hose pipe.

Manufactured only by WAITHMAN & Co., Bentham, Lancaster.

SUPER EXTRA STOUT QUALITY:—2, 2*s.*; 2¼, 2*s.* 3*d.*; 2½, 2*s.* 6*d.*; 2¾, 2*s.* 9*d.*; 3, 3*s.*

No. 0, a cheaper Hose, to bear a low pressure for Garden and Agricultural purposes, at greatly reduced prices:—1, 9*d.*; 1¼, 10*d.* 1½, 11*d.*; 2, 1*s.*; 2¼, 1*s.* 3*d.*; 2½, 1*s.* 6*d.*

The Hose is Burnettised at an extra charge of 3*d.* per yard. Union Joints, Branch Pipes, and Jets are also supplied.

"FRIGI DOMO."—Patronised by her Majesty the Queen, the Duke of Northumberland for Syon House, his Grace the Duke of Devonshire for Chiswick Gardens, Professor Lindley for the Horticultural Society, Sir Joseph Paxton for the Crystal Palace, Royal Zoological Society, late Mrs. Lawrence, of Ealing Park, and — Collier, Esq., of Dartford.

PROTECTION FROM MORNING FROST.

"FRIGI DOMO," a Canvas made of patent prepared Hair and Wool, a perfect non-conductor of Heat and Cold, keeping, wherever it is applied, a fixed temperature. It is adapted for all horticultural and floricultural purposes, for preserving Fruits and Flowers from the scorching rays of the sun, from wind, from attacks of insects and from morning frosts. To be had in any required length, 2 yards wide, at 1*s.* 6*d.* per yard run, of ELISHA THOMAS ARCHER, whole and sole manufacturer, 7, Trinity Lane, Cannon Street, City, and the Royal Mills, Wandsworth, Surrey; and of all Nurserymen and Seedsmen throughout the kingdom. "It is much cheaper than mats as a covering."

WATERPROOF PATHS.
BARN AND CATTLE SHED FLOORS.

THOSE who would enjoy their Gardens during the winter months should construct their walks of PORTLAND CEMENT CONCRETE, which are formed thus:—Screen the gravel of which the path is at present made from the loam which is mixed with it, and to every part of clean gravel add one of sharp river sand. To five parts of such equal mixture add one of Portland Cement, and incorporate the whole well in the dry state before applying the water. It may then be laid on 2 inches thick. Any labourer can mix and spread it. No tool is required beyond the spade, and in 48 hours it becomes as hard as a rock. Vegetation cannot grow through or upon it, and it resists the action of the severest frost. It is necessary, as water does not soak through it, to give a fall from the middle of the path towards the sides.

The same preparation makes first-rate paving for BARNS, CATTLE-SHEDS, FARM-YARDS, and all other situations where a clean, hard bottom is a desideratum. May be laid in winter equally well as in summer.

Manufacturers of the Cement, J. B. WHITE & BROTHERS, Milbank Street, Westminster.

FIRST PRIZE REAPING MACHINE.
NOTICE.

MESSRS. BURGESS AND KEY beg respectfully to inform the public, and particularly the noblemen and gentlemen whose orders they were obliged to decline for this season on account of the manufacture not being fully arranged, that the Royal Agricultural Society's First Prize of 30*l.* was awarded to them for M'Cormick's Reaper, with their patent screw platform, at the trial at Leigh Court, near Bristol, upon the 29th of August last. Amongst the competing machines were Bell's, by Crosskill; Forbush's, exhibited by Mr. Palmer; and Hussey's, with tilting platform, by Wm. Dray & Co. The reports of farmers who have worked the machines during this present harvest, show that the average quantity of Wheat, Barley, and Oats which they cut was from 1¼ to 1½ acre per hour. Two horses work the machine with ease, and the only attendant required is a man or a boy to drive. Further particulars and prices sent free on application.—BURGESS & KEY, 103, Newgate Street; and 52, Little Britain, London.

Printed by WILLIAM BRADBURY, of No. 13, Upper Woburn Place, and FREDERICK MULLETT EVANS, of No. 20, Queen's Road, West, both in the Parish of St. Pancras, and in the County of Middlesex, Printers, at their Office in Lombard Street, in the Precinct of Whitefriars, in the City of London; and published by them at the Office, No. 5, Upper Wellington Street, in the Parish of St. Paul's, Covent Garden, in the said County, where all Advertisements and Communications are to be ADDRESSED TO THE EDITOR.—SATURDAY, September 29, 1855.

The DESCRIPTIVE CATALOGUE OF FRUITS is now at Press.—Nurseries, Sawbridgeworth, Herts.

NEW PLANT LIST.

JOHN and CHARLES LEE'S CATALOGUE OF STOVE AND GREENHOUSE PLANTS for the present Autumn is just published, and may be had, post free, on application.—Nursery and Seed Establishment, Hammersmith, near London.

LOUIS VAN HOUTTE'S CATALOGUE for this season and next spring is to be had at Mr. R. Silberrad's, 5, Harp Lane, Great Tower Street, London. Sent free on application.—Ghent, Belgium, Oct. 6.

A. VAN GEERT, Nurseryman, Ghent, Belgium, begs to inform Amateurs and the Trade that he has just published a new PRICED CATALOGUE OF PLANTS, containing many Continental novelties and other useful plants.

May be obtained on application of his Agent, Mr. R. Silberrad, 5, Harp Lane, Tower Street, London.

AMERICAN PLANTS.

JOHN WATERER'S CATALOGUE OF RHODODENDRONS, AZALEAS, &c., as exhibited at the Royal Botanic Gardens, Regent's Park, London, is now published, and can be had on application.

☞ The Catalogue describes the colours of the Rhododendrons.
The American Nursery, Bagshot, Surrey.—Oct. 6.

NEW STRAWBERRY.

KITLEY'S CAROLINA SUPERBA, not surpassed in flavour, habit, and productiveness by any Strawberry extant, at the low price of 2*l*. per 100, 9*s*. per doz., free by post, to be had of Messrs. Garraway, Mayes, & Co., Bristol, agents for the west of England and South Wales, or of any respectable nurseryman. For a full description, testimonials, &c., see this Paper, April 14, 1855.
James Kitley, Lyncombe Vale Nursery, Bath.

TO AMATEURS IN CONIFERÆ.

MR. BARRON, of Elvaston Castle, will send out in a few days his Seedling Plants of PICEA NOBILIS. They are three years old, very strong for their age, with splendid roots, never having been in pots. Largest size, 63*s*. (very few of this size remain unsold); next size, 42*s*. A remittance or reference from unknown correspondents ordering after this date.

W. TOWNSEND has now ready to send out GERANIUM CYDONIA CARMINEA—for description see Advertisement, 4th August; has been exhibited at the National Society, 15th June and 26th August, and obtained a Certificate. Plants 5*s*., 7*s*. 6*d*., and 10*s*. 6*d*. each; one over to every three ordered in the trade. Post-office orders payable at Bayswater.—Notting Hill.

AGRICULTURAL SEEDS, ETC.

PETER LAWSON and SON, Seedsmen and Nurserymen to Her Majesty the Queen, and The Highland and Agricultural Society of Scotland, are now supplying the following seeds of the best quality:—

Italian Rye-Grass, Foreign seed	Dwarf Essex Rape
Crimson Clover (Trifolium incarnatum)	Winter Tares
Alsike Clover (Trifolium hybridum)	Natural Grass Seeds, for Pastures and Lawns, &c. &c. &c.

27, Great George Street, Westminster.

HARDY HEATHS.

WATERER and GODFREY respectfully invite attention to their large stock and first-rate collection of these most beautiful Hardy Plants. Priced Catalogues may be had free on application to Waterer & Godfrey, Knap Hill Nursery, Woking, Surrey.

SELECTED SEED WHEAT.

ABRAHAM HARDY and SON, Seed-Growers, Maldon, Essex, beg to offer their celebrated PROLIFIC RED, at 15*s*. Also Rough Chaffed, or Satin Wheat, of superior quality, at 12*s*. 6*d*. per bushel. New bag, 1*s*.; sack, 2*s*. Remittances must accompany orders. Prices of selected earliest Potatoes in variety on application.

GEORGE TABER, of Ravenhill, Essex, begs to inform the Trade that his growing crops of Seeds are now open to inspection. All Turnip Seeds grown from sound transplanted roots. Lists sent on application.—Oct. 6.

DOUBLE ROMAN and PAPER WHITE NARCISSUS, 4*s*. per dozen.—The above Bulbs, the former of which is so justly esteemed for its early blooming and excessive fragrance, and the latter for its purity and elegance, have just arrived, and may be obtained at A. Cobbett's Italian and Foreign Warehouse, 18, Pall Mall, near Waterloo Place London.

MAGNIFICENT SPECIMENS OF CONIFERÆ.

LUCOMBE, PINCE, AND CO. respectfully call attention to their very superior specimens of the above, which are worthy of the notice of all who are engaged in ornamental planting, their growth and shape being perfect, and their roots all that can be desired, so that where immediate striking effect, combined with perfect safety of removal to any distance is required, these large symmetrically grown and well managed plants can with confidence be recommended.

LUCOMBE, PINCE, AND CO.,
EXETER NURSERY,
EXETER.
ESTABLISHED 1720.

JOHN WESTWOOD will be prepared on and after the 10th of October next to send out good well-rooted plants of the following novelties, at the very low prices undernamed, viz.—

VERBENA "MRS. HALFORD."—The finest white yet raised; no other will be grown wherever it is introduced. Having had plants in his possession before any other florist, J. W. has now on hand many thousands, and is therefore enabled to offer them at 9*s.* per dozen, or 3*l.* per 100.

PETUNIA "MARQUISE DE LA FERTE."—A decided improvement on Shrubland Rose, and must entirely supersede it. The highest praise has been awarded this flower in the *Gardeners' Chronicle*, "The Cottage Gardener," and by all who have seen it. 8*s.* per dozen, or 2*l.* 15*s.* per 100.

All the White Corolla'd and other FUCHSIAS of 1855, let out by Chauviere, Epps, Henderson & Co., Lucombe & Co., and Smith, at 10*s.* per dozen.

The last new VERBENAS sent out by Chauviere, Smith, Turner, &c., many of which (especially those raised in France) are superior to the older varieties. 8*s.* per doz., or 2*l.* 15*s.* per 100.

Seedling Herbaceous CALCEOLARIAS from plants of first-rate quality (superior to any exhibited during the past season), carefully impregnated by the Rev. E. Trimmer, who has hitherto been remarkably successful with this flower. Best selection, 8*s.* per dozen, or 2*l.* 15*s.* per 100; 2d selection, 5*s.* per dozen, or 1*l.* 15*s.* per 100.

Seedling CINERARIAS from all the best named varieties, 4*s.* per dozen, or 1*l.* 10*s.* per 100.

Fimbriated PRIMULA SINENSIS, raised from plants inferior to none in the trade, of last year. 5*s.* per doz., or 1*l.* 15*s.* per 100.

J. W. has also for immediate sale Vines from Eyes of the best and leading sorts, at 24*s.* per dozen. And the true old Crimson Clove, at 5*s.* per dozen, or 1*l.* 18*s.* per 100.

The carriage will be paid to London; and where an order exceeds 2*l.* additional plants will be given in, and the hamper and package not charged for.

The Floral Nursery, Acton Road, Turnham Green.

CATTELL'S EARLY BARNES CABBAGE; DO. DO. RELIANCE; ALSO PARAGON, IMPERIAL, KING, NONPAREIL, ETC.

JOHN CATTELL has now ready Bedded Plants of the above, at 5*s.* 6*d.* per 1000. No charge for crates, baskets, or packing. Packages of 5000 or more are delivered to London and to the Edenbridge Station of the South-Eastern Railway carriage free. A remittance or reference to accompany orders from unknown correspondents.—Nurseries, Westerham, Kent.

WILLIAM YOUNG begs to call the attention of Noblemen, Gentlemen, Public Companies, and Planters in general to his extensive stock of CHOICE CONIFERÆ, HARDY EVERGREENS, ORNAMENTAL TREES, AMERICAN PLANTS, &c., which are this season particularly fine, and having been well prepared for removal, he can confidently recommend them to transplant with perfect safety.

W. Y. invites persons about to plant to inspect his stock, which is standing over 50 acres of ground, in which will be found all kinds of plants adapted to every description of ornamental planting. It consists of HARDY CONIFERÆ, containing some of the finest specimen plants ever offered.

Also strong plants of the following CHRYSANTHEMUMS, which are the best of last year:—Annie Henderson, Arigenia, Augustine Mie, Aurore Boreale, Bob, Brilliant, Comte Achille Vigier, Docteur Bois Duval, Eclipse, Hermine, Le Prophète, Louis Delaborde, Madame Passy, Marguerite de Valois, Marguerite de Wildemer, Pluie d'Or, Prince Jerome, Requiqui, Turris Eburnea, Zebra, at 8*s.* per doz., or the collection for 10*s.*

F. G.'s priced Catalogue of Dutch Bulbous roots is now ready, and may be had free on application. Remittances expected from unknown correspondents.

Broadfield Nurseries, Sheffield, Oct. 6.

THE CRYSTAL PALACE FLOWER BASKETS and HANGING GARDENS, made to the original Sydenham Pattern, and a variety of other new and elegant designs for the Conservatory, Verandah, Drawing Room, Boudoirs, &c., by W. RICHARDS, Imperial Wire Works, 370, Oxford Street, London, nearly opposite the Princess's Theatre; and at the Crystal Palace.

A large stock on view from 3*s.* 6*d.* upwards. Flower Stands, Trainers, Game and Garden Fencing, and Wire Work of every description. Conservatories and Aviaries fitted up in superior style. Window Blinds of all sorts.

370, Oxford Street; and Garden Entrance, Crystal Palace, Sydenham.

PAXTON WORKS, SHEFFIELD.

SAYNOR AND COOKE, Manufacturers of the celebrated Exhibition Prize PRUNING, BUDDING, and GRAFTING KNIVES, VINE and PRUNING SCISSORS, &c. These articles are Warranted to stand any kind of work, and to carry the keen edge of a razor without requiring to be sharpened so frequently as is usually necessary to obtain that sharp edge so requisite for the comfort and use of the practical gardener. The blades are also warranted to wear through to the back. They are used by all the eminent gardeners in England, Ireland, and Scotland, and can be purchased of any nurseryman or seedsman in the three kingdoms. Those who may not have used them are respectfully solicited to give them a trial. The Great Exhibition Prize Medal of 1851, and the Prize Medal of the Horticultural Society of Manchester, at their Show of 1854, was awarded to SAYNOR & COOKE for their superiority of material and workmanship. Established 1738.

HOSE PIPING.

WAITHMAN'S PATENT FLAX HOSE PIPING will sustain a greater pressure, is lighter, less bulky, will wear longer, and is about 60 per cent. cheaper than the leather hose pipe.

Manufactured only by WAITHMAN & Co., Bentham, Lancaster.

No. 1 QUALITY, INCHES IN DIAMETER AND PRICE PER YARD:—½, 9*d.*; ¾, 11*d.*; 1, 1*s.* 1*d.*; 1¼, 1*s.* 3*d.*; 1½, 1*s.* 5*d.*; 1¾, 1*s.* 7*d.*; 2, 1*s.* 9*d.*; 2¼, 2*s.*; 2½, 2*s.* 3*d.*; 2¾, 2*s.* 6*d.*; 3, 2*s.* 9*d.*

SUPER EXTRA STOUT QUALITY:—2, 2*s.*; 2¼, 2*s.* 3*d.*; 2½, 2*s.* 6*d.*; 2¾, 2*s.* 9*d.*; 3, 3*s.*

No. 0, a cheaper Hose, to bear a low pressure for Garden and Agricultural purposes, at greatly reduced prices:—1, 9*d.*; 1¼, 10*d.* 1½, 11*d.*; 2, 1*s.*; 2¼, 1*s.* 3*d.*; 2½, 1*s.* 6*d.*

The Hose is Burnettised at an extra charge of 3*d.* per yard. Union Joints, Branch Pipes, and Jets are also supplied.

MAPPIN'S PRUNING KNIVES IN EVERY VARIETY,
WARRANTED GOOD BY THE MAKERS.

JOSEPH MAPPIN AND BROTHERS, QUEEN'S CUTLERY WORKS, Sheffield; and 37, Moorgate Street, London. Drawings forwarded by post.

PARKES' STEEL DIGGING FORKS & DRAINING TOOLS.

MESSRS. BURGESS AND KEY, as Mr. PARKES' Wholesale Agents for England, have always in stock a large assortment. These Forks and Tools are now in use by upwards of 1000 of the Nobility and Farmers, members of the Royal Agricultural Society, who pronounce them to be the best ever invented, and to facilitate labour at least 20 per cent. Price Lists sent free on application, and Illustrated Catalogue of the best Farm Implements, on receipt of eight postage stamps.

103, Newgate Street, London.

HYACINTHS.

MESSRS. E. G. HENDERSON & SON

BEG to announce that they have now received their noted collection of HYACINTHS in excellent condition. They also beg to state, that having been for nearly 50 years the largest and most successful cultivators of this highly popular Flower in the vicinity of London, they can with confidence recommend the varieties named in their Catalogue as being the most suitable for pot or glass culture, and every way worthy the attention of Amateurs, &c.

Catalogues can be had on application, and for the assistance of those persons unacquainted with the culture of the Hyacinth, printed instructions will be given gratis with each order they are kindly favoured with.

CUCUMBER—HENDERSON'S "NAPOLEON III."

E. G. H. & SON have great pleasure in informing those who are fond of a really good Cucumber that they have succeeded in obtaining the stock of the above variety. It is one of the best for Winter culture and early forcing; is a free bearer and perfect in its form, possessing, indeed, all those qualifications of a good Cucumber which the most fastidious could desire. In packets, containing two seeds, 3*s.* each; ditto ditto, four seeds, 5*s.* 6*d.* each.

FLOWER SEEDS FOR AUTUMNAL SOWING.

Collections containing 12 distinct varieties, with printed instructions, 3*s.* 6*d.* each, postage free; ditto, 24, 6*s.*; 36, 8*s.* 6*d.*; 48, 10*s.* 6*d.*

CALCEOLARIA, CINERARIA, AND PRIMULA,

Saved from the choicest varieties, may be had in packets at 2*s.* 6*d.* and 5*s.* each; the finest quality of CALCEOLARIA is only offered at 5*s.*; second quality, 2*s.* 6*d.* The finest fimbriated Primula in the country, 2*s.* 6*d.*

NEW PLANTS.

In the possession of E. G. Henderson & Son, and will be sent out for the first time in October. Full Descriptions of the following may be seen in the New Autumn Catalogue, just published.

SHOW GERANIUMS.

EXCELSIOR (HENDERSON'S) | LA BELLE ALLIANCE (FOQUET) | PURPLE KING (FOQUET) | MIDNIGHT (FOQUET)

FANCY GERANIUMS.

AMPHITRITE (HENDERSON'S)
DUKE OF CAMBRIDGE (HENDERSON'S)
GIOVANNA (HENDERSON'S)
LA STELLA (HENDERSON'S)
MOONLIGHT (HENDERSON'S)
REINE DU BAL (HENDERSON'S)
ROSY-LIP (HENDERSON'S)
QUEEN OF THE FETE (HENDERSON'S)
SWEET LUCY (HENDERSON'S)
TITANIA (HENDERSON'S)

CINERARIAS.

ADMIRAL LYONS (HENDERSON'S).—Large full-sized flower, white, with purplish violet edging, dark dice, fine form. 10*s.* 6*d.*

FUCHSIAS.

BANKS' FAVORITE. 10*s.* 6*d.* | PRINCE OF WALES. 10*s.* 6*d.*

RHODODENDRONS.

The following magnificent new species, collected from the Bhotan Mountains, by Thomas J. Booth, Esq., are now, for the first time, offered for sale.

BOOTHI, | HOOKERI, | CALOPHYLLUM, | KENDRICKI, | EXIMIUM, | WINDSORI LEUCANTHUM.

For full descriptions, with prices of the above splendid varieties, see Spring Catalogue, page 85.

GYNERIUM ARGENTEUM (THE PAMPAS GRASS).

E. G. H. and SON having in their possession the largest stock in the country of this noble ornamental Grass, will supply healthy plants in October at 2*s.* 6*d.* each or 25*s.* per dozen.

N.B.—Price to the Trade per 50 or 100 can be obtained on application.

GLOXINIA ERECTA.

Messrs. E. G. HENDERSON & SON have great pleasure in announcing that they have a very large stock of this new class, and most showy upright flowering Gloxinias. They are the most abundant flowerers, containing among them some of the most lively contrasts of colours imaginable. The Collection includes the new varieties sent out this season. Price 5*s.* and 7*s.* 6*d.* each, or 42*s.* and 60*s.* per dozen.

The following can be supplied in fine plants for flowering next season:—

CAMELLIAS AND ORANGES, at 30*s.* and 42*s.* per dozen. | AZALEAS, ERICA, EPACRIS, and APHELEXIS, at 12*s.*, 18*s.* to 42*s.* per dozen.

N.B. Price to the Trade per 100 or 1000 can be had on application.

The Spring Catalogue or General List of Plants will be forwarded post free on application; and a beautiful Coloured Plate of NINE NEW FLOWERS *will be sent on receipt of* 12 *postage stamps.*

Wellington Nursery, St. John's Wood.

NEW SEEDS.—GROWTH OF 1855.

WILLIAM E. RENDLE AND Co., SEED MERCHANTS, Plymouth, are now harvesting in fine condition their General Collection of Agricultural and Garden Seeds for the coming season.

In order to give increased facilities for conducting their Seed Business, they are now considerably enlarging their offices and warehouses, which, when completed, will enable them to attend to all orders with promptness and despatch.

WILLIAM E. RENDLE & Co., Seed Merchants, Plymouth. Established 1786.

E. R. GREENUS, from his PROXIMITY to the Watford Station (London and North-Western Railway), begs to say that he can execute all orders with the UTMOST DESPATCH. His Stock (being FINE this season) of FRUIT TREES, Trained and Untrained; STANDARD and DWARF ROSES of the best sorts; well grown FLOWERING SHRUBS, EVERGREENS, FOREST TREES, AMERICAN PLANTS, and NURSERY STOCK in general, all which, from FREQUENT TRANSPLANTING, can be removed with perfect safety and success. Carriage paid to London on all orders above 2*l*. Garden and Agricultural Seeds supplied.—Railway Nurseries, Watford and Rickmansworth.

TO BE SOLD, a bargain, a fine lot of Specimen and other CAMELLIAS, beautifully set with bloom buds; several collections of choice show and fancy GERANIUMS of the most approved varieties; sets of all the NEW FUCHSIAS, with white corollas, &c.; about 700 VARIEGATED GERANIUMS, comprising Mountain of Light, Flower of the Day, and Osborn's Brilliant; and a quantity of large STOCK PLANTS of sorts, claiming the attention of all who are about to furnish or propagate. Also a large BOILER nearly new, capable of heating a spacious House, and a small ditto suitable for a range of Pits, &c.—The above may be seen, and the prices had by applying to JOHN SLIPPER, Villa Nursery, Camden Town.

CHOICE HOLLYHOCK, SWEET WILLIAM, AND ANTIRRHINUM SEED.—IN SEALED PACKETS.

JOHN CHATER AND SON have well-ripened Hollyhock Seed, saved from the best sorts in cultivation, in packets of 200 seeds, 1*s*. 6*d*.; 400, 2*s*. 6*d*. Improved Sweet William Seed, saved with great care from varieties with smooth-edged petals, 600 seeds, 1*s*.; 1000, 1*s*. 6*d*. Antirrhinum, 6*d*. per packet. Also plants of Double Crimson Rockets, 4*s*. 6*d*. per dozen; 32*s*. per 100. Double Major White, 2*s*. 6*d*. per dozen; 18*s*. per 100. A large collection of Hollyhock plants, including the best sorts out. Catalogues on application at the Nurseries, Haverhill.

N.B.—The Seeds can be supplied by Mr. DENYER, Gracechurch Street, or Mr. HOOPER, Centre Avenue, Covent Garden, London.

NEW PELARGONIUMS.

GEORGE SMITH has a fine Stock of the following first class PELARGONIUMS in strong Plants, at from 30*s*. to 40*s*. per dozen, according to the sizes of Plants, hamper included with Plants to compensate for carriage:—(Forster's), Jessica, Phaeton, Seraskier; (Hoyle's), Hubert, Lord Raglan, Omar Pasha, Serena, Topsy, Wonderful, Yerda, Zoe; (Beck's), Conqueror, Dido, Fidelia, Laura, Lydia, Silenus; (Turner's), Grand Sultan, Pandora; (Forquett's) Petruchio; (Story's), Fair Ellen, Snowflake; (Horken) Una; (Cant's) Vespa; (Dobson's), Commander-in-Chief; (Fuller's) Gem of the West. With a choice assortment of show and fancy kinds. A descriptive Catalogue on application. Unknown correspondents forwarding a remittance with their orders will be liberally dealt with. Post-office orders payable at Islington.

Tollington Nursery, Hornsey Road, Islington, London.

THE IMPROVED BROWICK RED AND OTHER SEED WHEAT.

WILLIAM BARNES, in returning thanks to his customers for SEED CORN, begs to offer this season the following sorts, which have been procured from the finest and best varieties, regardless of expense in the purchase and cost in the cultivation—viz., Improved Browick Red, Spalding's Red, Old Red or Lammas Wheat, White Chaff Red, and Bristol mixed with White, all of which he will warrant *true and clean*.

Mr. B. can recommend the Improved Browick Red with much confidence as being one of the greatest acquisitions in Red Wheat, for light or black land, yet offered to the farmer. In this locality (Deeping Fen) it was less injured by frosts and mildew than other Reds, and was pronounced by all who inspected it whilst standing over several acres to be unrivalled by any in the district.—For further particulars, address WILLIAM BARNES, the Elms Farm, near Spalding, Lincolnshire.

WATERER'S AMERICAN PLANTS.—A new DESCRIPTIVE CATALOGUE is now published of the celebrated Collection of hardy Scarlet and other Rhododendrons, as exhibited by JOHN WATERER at the Royal Botanic Gardens, Regent's Park; it will be found to contain a few practical observations on their successful management, and will be forwarded on application by enclosing two stamps for postage. Apart from its enumeration of the most popular American Plants in cultivation, a List of choice Coniferæ will be seen, embracing the latest importations of this fine and hardy tribe of Plants.

J. W. has now the pleasure to offer in large quantities, and of all heights, the following selection of CONIFERS, with the remark that they are all now growing in the open ground, are bushy and handsome as can be desired, and have been transplanted each succeeding spring, whereby no risk can be encountered in their removal from the nursery:—Araucaria imbricata, Cryptomeria japonica; Pinus Douglasi, Cembra, excelsa, Lambertiana, insignis, Jefferyana, Beardsleyi, tuberculata, &c.; Cedrus Deodara, Lebanon, and Africana; Wellingtonia gigantea, Cupressus, Juniperus, Taxus, Thuja, &c.

☞ The attention of gentlemen, public companies, and others engaged in planting, is especially directed to the foregoing; indeed, all intending planters would be well repaid by a visit to inspect our stock, as much may be seen which of necessity cannot be given within the limits of an advertisement.

The Nursery is easily reached by railway, being near the Farnborough Station, South-Western Railway, and Blackwater on the South-Eastern Railway.

The American Nursery, Bagshot, Surrey.

CUCUMBER SEEDS FOR WINTER SOWING.—The three best and most certain varieties ever sent out, and such as are sure to give satisfaction for winter growing. General Canrobert, fine black spine, length 15 inches, 2*s*. 6*d*. per packet. Lo Kenyon's Favourite, length 12 inches, very handsome, free setter, and most prolific bearer, 2*s*. 6*d*. per packet. Gordon's White Spine, length 20 inches; this has proved to be the best long winter variety now in cultivation, 1*s*. 6*d*. per packet.

DIGITALIS, OR FOX-GLOVE SEED.

This beautiful hardy biennial has been so much improved within the last two or three years by continual hybridising, that the brilliancy of the colours, the numerous varieties into which it has sported, and the dwarfness of the plants, will cause it when once known to be planted in the largest and smallest of flower gardens, round the borders of shrubberies, and for making beds in large pleasure grounds where brilliancy and effect is required. They will grow well on rock-work or sloping banks, where numerous other varieties of plants will not thrive at all. The seed should be sown now in pans or boxes, and planted out early next spring; by so doing they will bloom well next season.

Sold in packets at 1*s*. 6*d*., or double packets at 2*s*. 6*d*. Every order must be accompanied by Penny Postage Stamps, or Post Office Order payable to

EDWARD TILEY, NURSERYMAN, SEEDSMAN, & FLORIST, 14, Abbey Churchyard Bath, Somerset.

AMERICAN PLANTS.

WATERER AND GODFREY beg to announce their Priced and Descriptive Catalogue of American Plants for this season is now published, and will be sent free on application. As the collection of American Plants at this Nursery is altogether unequalled in extent or quality, purchasers will find it to their interest to pay a visit to the Nursery, which may be readily done by the South Western Railway to Woking Station.

Knap Hill Nursery, Woking, Surrey.

FRUIT TREES IN POTS.

H. LANE AND SON have the pleasure of announcing that their very extensive collection of FRUITS IN POTS are now ready for sending out, well set with bloom-buds, consisting of Peaches, Nectarines, Apricots, Cherries, Plums, Pears, Apples, &c., and are quite worthy the attention of those who take a delight in this particular branch of horticulture.

The Nurseries, Great Berkhamstead, Herts.

PELARGONIUMS NOW READY FOR SENDING OUT.

J. DOBSON AND SON beg to offer the following varieties, which have proved themselves to be first-rate; the plants are very fine, and cannot fail to please any purchaser. The following 12 for 63*s*., hamper, package, and carriage to London, free:—Ambassador, Conqueror (Beck's), Carlos, Empress, Gem of the West, Governor General, Laura, Leah, Phaeton, Topsy, Vulcan, Wonderful.—Woodlands Nursery, Isleworth.

VEREA CRENATA (*Syn.* KALANCHOE VARIANS), —THE LEAF OF LIFE—*Nat. Ord.* CRASSULACEÆ.—A small importation has lately been made of the leaves of this interesting botanical curiosity, which matures plants in the serrations of its leaves.—Leaves on sale at 2*s*. 6*d*. each, post free, at GEORGE ROBERTS, 32, Moorgate Street, London, where a drawing of the plant in flower may be seen. Further described in reply to letters.

JOHN HOLLAND, Bradshaw Gardens, Middleton, near Manchester, will be happy to forward his Autumn Catalogue, containing priced and descriptive lists of the following choice and popular flowers, for one postage stamp:

Auriculas	Pinks	Phloxes
Alpines	Pansies	Belgian Daisies
Carnations	Polyanthuses	Show Gooseberries
Picotees	Primroses	Currants, &c. &c.

A few packets of very choice Pansy Seed, at 1*s*. & 2*s*. per pckt.

RARE BRITISH FERNS.

JAMES BACKHOUSE AND SON can now offer nice Plants of the rare PSEUD-ATHYRIUM FLEXILE, from the Clova Mountains, Forfarshire, discovered by themselves in 1852, at ... ... 21*s*. 0*d*. each

PSEUD-ATHYRIUM (Polypodium) ALPESTRE	5	0	„
WOODSIA ILVENSIS,* 5*s*. each, extra strong	7	6	„
LASTRÆA RIGIDA	2	6	„
CYSTOPTERIS DICKIEANA	3	6	„
POLYSTICHUM LONCHITIS	3	6	„
CYSTOPTERIS MONTANA	10	6	„
Ditto ditto a few extra strong	21	0	„

*Though a British species, the roots offered are Norwegian.

York Nurseries, Oct 6.

TO GRAPE GROWERS.

EAGLE AND HENDERSON have much pleasure in calling the attention of Grape Growers to the following collection of Strong VINES in pots, from eyes, viz.:—

Barbarossa, Black	Gibraltar	Musque Chasselas
Black Prince	Hamburgh, Black	Nice White
Burgundy, Miller's	„ Champion	Prolific
Bourat Blanche	„ Millhill	Sweet Water, Grove[nd
Constantia, Black	„ Victoria	„ Royal
Cambridge Botanic Garden	Josling's St. Albans	„ White
Damascus, Black	Lombardy, Black	Syrian
Esperione	La Cœur	Southfield, Black
Frontignan, Black	Muscat of Alexandria, Black	Seedling, Whitehill
„ Blue	„ „ White	„ Lady Doune's
„ Grizzly	„ Canon Hall	„ Abercairney
„ White	Muscadine, Royal	Tokay, Charlesworth
Golden Drop	„ White	Tripoli
		Turner's Black

From 3*s*. 6*d*. to 5*s*. each.—Usual discount to the trade.

Shrub Bank Nurseries, Leith Walk, Edinburgh, October 6.

GRAPE VINES FROM EYES IN POTS.

LUCOMBE, PINCE, AND CO. beg respectfully to call attention to their remarkably fine stock of Grape Vines, raised from eyes in pots, in a bearing state.

L., P., & Co. having two years ago erected a Vinery 90 feet long for the especial purpose of proving every good Vine in cultivation, are enabled to say that the Plants sent out by them are true to name.

LUCOMBE, PINCE, AND CO.,
EXETER NURSERY,
EXETER.
ESTABLISHED 1720.

THE PAMPAS GRASS,
"GYNERIUM ARGENTEUM."

LUCOMBE, PINCE, AND Co. having now for sale the finest stock of flowering plants in this country of the above, are enabled to offer their well established plants to bloom this autumn at the following prices:—

Fine specimens with two flower stems ...	21*s*. 0*d*. each.
Ditto with one ditto	10*s*. 6*d*. „
Smaller plants to bloom next year	7*s*. 6*d*. „

L., P., & Co. have also healthy seedlings at 30*s*. per dozen, which will be ready in October, which, however, they deem it right to say will most probably not bloom for two years. To such parties as wish at once to see the plant in its beauty, L., P., & Co. would strongly recommend the larger sizes, as they are much better and cheaper.

Few plants are more ornamental than this Gigantic Grass, the leaves (which are more than 7 feet in length, curving gracefully outwards) grow in large tussocks, thereby producing a very fine effect, and from the midst of these numerous flower stems arise to the height of from 6 to 8 feet, surmounted by elegant panicles of inflorescence nearly 3 feet long, resembling beautiful waving plumes of silvery feathers. It is perfectly hardy, and is also easy of cultivation. A grand specimen of this noble plant is now in the Exeter Nursery, pushing up nearly twenty large flower stems and numerous small ones, and will continue to be an object of great attraction for a considerable time.

EXETER NURSERY, EXETER.
ESTABLISHED 1720.

NEW STRAWBERRIES AT REDUCED PRICES,
GROWN AND OFFERED FOR SALE BY

WILLIAM J. NICHOLSON, Egglescliffe, near Yarm, Yorkshire.—The following splendid varieties have been well proved this season and given complete satisfaction, viz., Sir Harry (Underhill's), 100 plants, 4*l*.; 40, 1*l*. 18*s*.; and 20, 1*l*.; or 12*s*. 6*d*. per dozen. Omar Pacha (Ward's), 1*l*. per 100; 12*s*. per 50; 7*s*. per 25. Scarlet Nonpareil (Patterson's). 2*l*. per 100; 1*l*. per 50; 12*s*. per 25. Sir Charles Napier (Smith's), 1*l*. per 100; 12*s*. per 50; 7*s*. per 25. Admiral Dundas (Myatt's), 1*l*. per 100; 12*s*. per 50*s*.; 7*s*. per 25. Nicholson's Ajax, Ruby, Captain Cook and Fill-Basket, 6*s*. per 100; Ingram's Prince of Wales, Nimrod, Eliza (Rivers's), Surprise (Myatt's), and Bicton Pine, a large white one, 6*s*. per 100; British Queen, Black Prince, Eleanor (Myatt's), Old Pine, Trollope's Victoria, Goliah (Kitley's), Keens' Seedling, Old Roseberry, all at 4*s*. per 100; Crystal Palace, a very large and late variety, 10*s*. per 100. Post-office Orders payable at Yarm are expected with all orders. The plants will be securely packed and forwarded to any part of the kingdom.

Plants kept in frames for spring planting.

SUTTON'S IMPROVED ITALIAN RYE GRASS.

SUTTON AND SONS, SEED GROWERS, Reading, are now harvesting their crop of Seed of this superior variety of Italian Rye Grass, and are also importing a supply of fresh Lombardy Seed. As the demand appears likely to be great, Messrs. SUTTON respectfully recommend their friends who intend to sow these articles next season, to favour them with their orders early, in case the stock should prove short.

N.B. SUTTON & SONS *do not appoint Agents for the sale of their Seeds; but they deliver them carriage free by Rail to most parts of the United Kingdom.*

GEORGE JACKMAN begs to state his PRICED CATALOGUE of choice CONIFERA, HARDY EVERGREENS and ORNAMENTAL TREES, which are well grown, and constantly removed; also Roses, Standard, Dwarf, and dwarf-trained Fruit Trees, and Forest Trees, can be had on application by enclosing one Postage Stamp.

G. J. respectfully invites persons planting to pay a visit to his extensive nursery, one and a half mile from Woking Station, South Western Railway, where all trains stop, and conveyances can be had.—Woking Nursery, Woking, Surrey.

RHODODENDRONS.

JOHN WATERER begs to announce that he is now prepared to execute orders for his two New Hardy Hybrid Rhododendrons, in good established plants, at 42*s*. each.

Rhododendron JOHN WATERER, colour glowing carmine, large truss, fine foliage, and a most abundant bloomer, in perfection about the 15th June.

Ditto, MRS. JOHN WATERER, a bright rosy crimson, fine conical truss, a very free blooming kind, in flower about 15th of June.

To the admirers of this justly noble class of Plants, JOHN WATERER has the pleasure of recommending the above as being the greatest acquisitions yet offered. They combine in a marked degree the necessary requisites for really first-rate hardy crimson varieties, viz., imposing colours, abundant bloomers, extreme hardiness, and flower at a time when they are not liable to be injured by spring frosts.

The American Nursery, Bagshot, Surrey, Oct. 6.

The Gardeners' Chronicle.

SATURDAY, OCTOBER 6, 1855.

ONE of our acquaintances, a Mr. JAEL, is a lover of fresh FIGS, and having a garden was ambitious of growing them for himself. But his garden was in a cold bottom, and its soil was heavy clay. He had no greenhouse, or wall, and his gardener had not been instructed at Arundel, or Chatsworth, or Trentham. When he mentioned his wish to grow Figs in such a place with such means, his gardening acquaintance smiled at his simplicity; what! grow Figs in clay in such a wet cold place, with no shelter and no professional help! it was chimerical. The old Fig trees were pointed out in neighbouring gardens, where walls and shelter and skill were provided in abundance, and he was advised to take warning by them; for even they scarcely ever ripened a Fig worth eating.

It must be owned that the proposed experiment was not encouraged by his neighbours' experience. But Mr. JAEL had already found out that in gardening as in other pursuits what can't be done in one way may be effected in another, and he concluded that if soil, situation, climate, and all the conditions usually thought necessary for Fig growing were denied to him, he might somehow or other find their equivalents. And so he set about his work.

In March, 1854, he dug a hole on the south side of a ditch, and filled the hole with lime rubbish, burnt clay, the ashes of rubbish heaps, and rotten leaves. The hole was about 2 feet deep, 4 feet wide, and its bottom might be a couple of feet above the water in the ditch. In this place he planted, in May, a Fig tree about 9 inches high.

The plant grew well all through the summer, and, if permitted, would have been 4 or 5 feet high by autumn. But our experimentalist wanted a little plant, not a big one, and he was looking for Figs not leaves; so he applied to his Fig tree the stopping dodge. As fast as 5 or 6 leaves made their appearance, the shoot to which they belonged was pinched back to 3 or 4; and all through the summer every new shoot, of which plenty came, was served in the same way. By October the Fig tree had been so cramped and stunted that it was not above 2 feet high, and on most of its little branches were little balls no bigger than a Marrowfat Pea. These were Figs in embryo; in ten or eleven months more they would be full grown, ripe, and fit to eat. So far, then, all had gone well. The tree had done all that the most unreasonable gardener could have expected from it. But what was to become of it and its little ones during the winter? You'll see, said the neighbours, that all your young ones will perish of cold, and most likely their mother too.

We have already said that Mr. JAEL had no greenhouse, or wall, or shelter, to which he could trust his pet Fig. But he had a few shillings to spare, and with them he bought a load of peat turves. Now peat turves are of all things the most useful to gardeners. Neither rain nor frost will go through them easily, they form the best walls in the world, and when the walls are pulled down they become the most valuable of all the sorts of earth a gardener wants. So with these turves the Fig tree was enclosed on all sides, till the walls were higher than its head; and then it was left till the leaves looked as if they were ready to come off. In the mean-

while the walls had kept away the worst weather and dried the ground a little. As the leaves dropped they were taken away, and to get the ground drier still against winter an old wooden shutter that happened to be at hand, was laid over the top like a sloping roof, resting on the peat walls.

At last came unmistakeable signs that winter was at hand, and as soon as this was certain the inside of the walls was stuffed with old straw that had been used for packing—so that the Fig tree with its naked branches was snugly tucked up in a warm bed for the winter. The shutter was then fastened down and covered over with a layer or two more of peat turves.

There it lay all the winter; and a cold one it was; but the ground was dry, and the walls were dry, and the roof was pretty water-tight, and the Fig tree felt none of the storms that beat against its house.

December, January, February, passed away; and with them the most dangerous frost. It was in the middle of March that the turves were taken off the shutter, and the shutter lifted up, and a peep had among the straw. There lay the branches as fresh and green as in October, and there were the little Figs, on which Mr. Jael's hopes had dwelt so long, all as round and plump as ever, but no bigger than before. So he carefully drew the straw around them again, and put on the shutter, but left the turves upon the ground. And every fine dry day the shutter was lifted up, to be replaced at night, till there was a little sign of the Fig tree wishing to grow. Then out came all the straw. In a few days more the front wall of the turf-house was taken down; in another week or two the west wall, and by the end of May nothing was left of the winter shelter except the north wall, which served to keep away cold winds all the summer.

And what was the fate of the little tree? The experienced said, when they saw it, that it was all very well so far, but that the tiny Figs preserved with so much trouble would fall off, and that Mr. Jael would have his work to do again, for as to Figs ripening in such a place it was not to be thought of. Well! this was partly true. Some of the little Figs, the oldest of them, did fall off; but not many. The others held fast, and became rounder and rounder, and longer and longer, and browner and browner, till at last by the end of September, in 15 or 16 months from the beginning of the attempt, Mr. Jael had gathered a dozen capitally ripened Figs, and he expects to have two or three more.

The only observation which his neighbours made when they saw what happened was, well it is very odd; we never could get our Figs to do any good; indeed in the grand garden of Mr. Spencer, hard by Mr. Jael's bit of ground, not a Fig will ripen this year, though the walls are 12 feet high.

This example may serve to show those who have bad soil, bad situation, bad climate, and no glass-houses, that even then something may be done in a garden, if principles are understood and men have only a very little ingenuity to assist them in applying them. There are other things which our friend Jael could tell us about, if he were encouraged; but he is a diffident man, and not fond of having his name in everybody's mouth.

The last subject to which we for the present propose to advert, in connection with Botanical Gardens, are Arboreta. In those now attached to a great many botanical gardens, the most prominent defects are overcrowding, indiscriminate admission without selection, and want of arrangement. If we consider that, generally speaking, a tree will not show its true character till, having attained a considerable size, it is capable of bearing fruit, we must see how necessary it is to give it space enough for that purpose. It is true that the whole ground usually allotted to the arboretum will, if so planted, admit no more than a very small proportion of the trees which might be procured; but if this small portion is well selected and well grown, it will give the student a great deal of information on the habits, mode of growth, and general physiology of trees and means of comparison with their herbaceous allies which he can never obtain from the mass of drawn up half-dead starvelings—mere sticks with labels to them, which may be seen crowded together in many arboreta, often not more than 2 or 3 feet apart. Selection, *vice* collection, is here more important even than in the herbaceous garden. Twenty or 30 real trees of as many different genera are surely better than any number of wiry saplings which never flower, and half of which are but slight varieties of each other, or mere individual aberrations. Sometimes, it is true, the arboretum may be spread over such a wide extent of pleasure ground that almost all hardy trees may be planted without interfering with each other; but even then, in a botanical collection, there is little use in planting any but good species or well marked varieties, which can be distinctly recognised and named. The wilderness of Cratæguses, Elms, Lime trees, &c., in some arboreta is as hopeless and useless as that of the Asters and Stachyses in the herbaceous ground. There are certain classes also of specimens of trees which, however commonly planted, we would reject from any botanical arboretum: such are in the first place the so-called varieties with variegated, crisped or cut leaves, weeping branches, &c., which are mere individual constitutional peculiarities, and belong to horticulture, not to botany; and in the next place trees too tender for the climate, which may live on for years, but, in their constant struggle for mere existence, never can represent their species.

The arrangement of the trees in the arboretum is a more difficult question than that of the herbaceous collection. If planted in regular rows they occupy an immense space, which cannot be made ornamental. Scattering them indiscriminately about the pleasure ground interferes with the studying them in succession, or the readily finding them for comparison. When grouped in clumps science is sacrificed for show, without making them really ornamental. In those gardens where the two objects really appear to be well combined, the trees forming the botanical collection are planted at stated distances in a fixed order along the walks and paths of the pleasure ground; the shrubberies and clumps necessary for breaking the lines and fulfilling the general plan of the garden being made up of really ornamental shrubs and horticultural varieties quite independent of the scientific collection.

As trees are too large for those of one group to be all seen at once, their labels will require the addition of the natural order to which they belong.

In plant houses, overcrowding without selection is still more conspicuous than in the other departments. There are few where the plants do not injure each other by too close packing, still fewer where the collection would not be much improved by throwing away a considerable number. Plants which have been early pot-bound, and contracted an unhealthy, stunted, unnatural growth; wiredrawn lanky specimens almost bare of flowers or leaves; tropical trees which can be of no interest until they have far outgrown the houses they are kept in; if such were discarded, space, time, and means would be economised for the maintenance in health and vigour of a small but instructive selection. If it be true that advantage should be taken of every corner of a space which has cost so much money, it is no less certain that that space is as essential for quality as for quantity.

The arrangement of the plants in the houses is often conducted on better principles, and with more taste, in some of the German and Russian than in any other gardens. When grouped according to their natural affinities, with such modifications only as are required by size and mode of culture, it is astonishing how pleasing an effect is produced; and the larger the collection and the more extensive the houses, the more satisfactory are the results of such an arrangement. The same principles may be beneficially applied in the grouping the greenhouse plants in the ornamental ground in summer, as stated in Prof. Hoffmann's report already referred to (see p. 404).

The labelling of plants in houses needs no further details, as we can only repeat that in this as in every other department open to the public for the purposes of science, it is most essential that the labelling should be universal, conspicuous, and, above all, correct. *G. B.*

NEW GARDEN FERNS.—No. IV.

8. Phlebodium inæquale, T. M. in Herb. (Polypodium triseriale, of gardens.)

Fronds ample, pinnate, membranaceo-herbaceous; pinnæ lanceolate slightly glaucous, the lower ones stalked, the upper sessile and adnate, all unequal at the base; sori large round, uniserial near the costa; rhizome clothed with oppressed ovate acuminate scales; fronds annual articulated.

We are indebted for our knowledge of this fine Fern to Mr. Henderson, gardener to the Earl Fitzwilliam at Wentworth. The fronds are large, drooping, pale green, three or four feet or more in length, pinnate, oblong-ovate; the lower pinnæ in a fine frond from Wentworth now before us being about 10 inches long and 1½ inch broad, the upper ones 6 inches long and 1¼ inch broad, and the terminal one of the same length and breadth. The lower pinnæ are lanceolate, attenuated at the apex, as well as narrowed at the base, where they are unequally developed, the lamina on the anterior side being continued down the petiole beyond that on the posterior side; the pinnæ about half-way up are sessile; the upper ones are adnato-decurrent; and the terminal one is usually but not always somewhat lobed and unequal at the base. The margin of the pinnæ is crenulate. The sori are large, round, situated in a single series near the midrib; sometimes seated on the apex of a veinlet within a costal areole, which is a characteristic of Goniophlebium; sometimes on a veinlet exterior to the costal areole; sometimes at the point where two or more veins unite, which is the normal condition of Phlebodium. It is consequently an osculating species between the genera Goniophlebium and Phlebodium. It is a free growing showy warm greenhouse species, and is remarkable for its deciduous character, the fronds being all cast off in winter and renewed in spring. The stipes is smooth and pale green. The rhizome, which is as thick as one's thumb, and grows in a branching tufted manner, is covered with ovate acuminate oppressed scales. The general aspect of the plant is that of Phlebodium aureum, but it differs essentially in the annual fronds, and in their truly pinnate character. It appears to be a native of Guatemala, and to have been imported some years since by Messrs. Loddiges.

9. Adiantum cultratum, J. Smith MS.; Hook. Sp. Fil. i. 34. (A. pentadactylon of gardens, not of Langsdorff and Fischer.)

Fronds glabrous, tripartitely bipinnate; pinnules cordately rhomboid-oblong, lobed on the upper margin and apex, entire on the deorsely falcate lower margin; sori small, narrow, linear-oblong, on the apices of the lobes; stipes brownish ebony-coloured; fronds adherent.

This is a very fine and ornamental species of Adiantum, requiring stove culture. The fronds are glabrous, dull green, with an olive tint, 1½ foot to 2 feet high, and tripartitely bipinnate, that is bipinnate, with the lower pair of pinnæ two-parted. The pinnules are somewhat cordately rhomboid-oblong, the upper margin and the more or less attenuated apex being lobed with serrated lobes, and the lower margin recurvate. The sori are small, narrow, linear-oblong, occupying the apices of the lobes, and chiefly produced on the upper margin. The

stipes and rachis are dark chesnut-coloured when young, becoming blackish when mature; at first scaly throughout, with narrow deciduous scales. The fronds are adherent to a creeping rhizome. The species was introduced from Belgium under the name of A. pentadactylon, which belongs to a lobed form of A. trapeziforme. From the latter, to which it is allied, this differs in being a more slender plant, and in having narrower deorsely falcate pinnules scarcely at all glaucous beneath, and smaller linear-oblong sori; it is, morever, wanting altogether in that delicate tint of green which in A. trapeziforme contrasts so strikingly with the ebony-coloured stipes. Nevertheless, it is a handsome species, desirable for cultivation.

10. Gymnogramma lanata, Klotzsch MS.; A. Braun in App. Gen. et Sp. nov. Hort. Reg. Bot. Berol. coluntur, 1854.

Fronds ovate-lanceolate, bipinnate below, pinnato-pinnatifid above, the apex lengthened pinnatifid; pinnæ sessile narrow-lanceolate; pinnules oblong, the lower ones more distant contracted at the base, the upper confluent; blunt, the lowest lobulate or subpinnatifid at the base, unequally toothed, the margins somewhat reflexed; upper surface glabrous, lower densely woolly; stipes and rachis covered with dense pale cinnamon-coloured woolly hairs.

This is a very remarkable and distinct looking Fern. It was gathered in Veragua by M. Warszewicz, in 1850, and was first raised from spores in the garden of M. Mathieu, of Berlin, whence it has been dispersed.

A fine specimen was several times exhibited during the past summer by Mr. Fletcher, gardener to Dr. Young, of Kennington. It has a short erect caudex, producing a moderate number of soft herbaceous fronds,

which have their stalks clothed with a pale cinnamon-coloured wool, and their under surface densely covered with whitish woolly hairs, the upper surface being smooth. Along with the woolly hairs at the base of the stipes are a few darker coloured criniform ones. The sori are borne over the whole under surface, and consist of lines of spore-cases following the course of the forked free veins. It is, therefore, a genuine Gymnogramma, although very unlike those familiar in gardens. In our specimen from Dr. Young's plant, the stipes is about 9 inches long, the leafy part of the frond nearly 18 inches; the longest pinnæ about 5 inches long; and the pinnules an inch. Several of the basal pinnules of all the lower pinnæ are cut into roundish lobes on the margin. It is a very desirable and ornamental stove evergreen Fern.

11. Acrophorus hispidus, T. Moore, Proc. Lin. Soc., 1854, 285. Davallia hispida, Heward Herb. D. Novæ-Zelandiæ, Colenso, Tasm. Journ. of Nat. Science; Hooker, Species Filicum, t. 51. B.

Fronds ovate acuminate, tripinnate, rigidly membranaceous; pinnæ stipitate linear oblong acuminate; pinnules obliquely pyramidato-lanceolate with pinnatifid tips; secondary ones lanceolate, deeply pinnatifid, the segments ovate acute falcate, or obovate, with one or two teeth, or sometimes entire; sori numerous on the lateral teeth of the lobes; indusium a broadly ovate scale, affixed across its base; caudex slender creeping hairy; stipes and rachides fuscous, the base of the stipes and axils of the primary pinnæ furnished with copious ferruginous hairs.

This plant has been referred to that group of Davallia to which the name of Leucostegia has been given. It differs from Davallia in not having the sori enclosed by a tubular involucre, but covered by a flat scale affixed only across the base, and is therefore, in our view, rather akin to Cystopteris than to Davallia. This group of Leucostegia we unite with Acrophorus, the differences between them being unimportant. It forms a very elegant greenhouse evergreen Fern, growing

up from the widely creeping rhizome, with a frond of variable size; in some cases two feet high including the stipes, which is about half the length; and sometimes, according to Dr. Hooker, not more than three inches high. Both the stipes and rachis are deep shining brown. The fronds are amongst the most beautifully and finely divided of their race, and are extremely elegant, lively green, loaded with fructifications, which are usually placed on the small teeth or lobes of the ultimate divisions. This species was imported a short time since by Mr. R. Kennedy, from New Zealand, where it had been originally found by Mr. A. Cunningham. We have to thank Mr. Kennedy for fresh fructified fronds, which produce sori, whilst of a much smaller size than that to which the species attains in its native country.

12. Lomaria discolor, Willdenow, Sp Pl. v., 293. Onoclea, Swartz. Hemionitis, Schkuhr. t. 6. Osmunda, Forster.

Fronds tufted, pinnate; the barren narrow lanceolate with alternate sessile oblong acutish horizontal subserrulate pinna, pallid beneath; the fertile linear-lanceolate, with linear obtuse horizontal pinnæ, dilated often leafy at the base; indusium ciliately toothed.

This species was introduced from New Zealand by Mr. Kennedy, and has produced its fructification in the collection of Dr. Young, of Kennington. The barren fronds spread from an erect caudex, and are narrow lance-shaped, with crowded horizontal oblong acutish pinnules, dark green above and paler beneath; they are from 1 to 1½ feet long. The fertile grow taller and erect; they are of narrower outline, and have blunt linear horizontal pinnæ, dilated at the base, these dilated bases in the lower pinnæ being usually devoid of spore cases. It is a handsome evergreen greenhouse Fern. *T. M.*

CULTIVATION OF HYACINTHS IN GLASSES.

Fill the glasses with rain or river water so as just to touch the bulb; place them in a dark cellar or closet for about a fortnight, which will encourage the growth of the roots, after which they should be brought to the light, and kept as near the window as possible. If allowed to remain on the mantelpiece or other warm place away from the light, the flowers will be drawn up prematurely, and thus prevent the full development of their colour and size. The water should be changed once a fortnight, or oftener if it becomes foul, and the bulb cleansed each time. Some kinds are apt to produce offshoots at the sides of the bulb; these should be removed with a budding or penknife; but when two stems rise from the centre, they should be both allowed to bloom. The single Hyacinths generally are the most suitable for blooming in water, but there are some double varieties which thrive equally well. When overblown they should be stripped of the faded blossoms, and planted in the open garden in a dry situation.

On Blooming Bulbs in Pots.—Hyacinths, Narcissus, Jonquils, Tulips, &c., should be planted with the upper point of the bulb just above the soil. When planted, the pots should be plunged under ashes, sawdust, or tan, until the leaves begin to grow, when they should be gradually exposed to light and heat. The pots should be deep and well drained. Any good potting mould will suit bulbs, and they will thus bloom much finer than in water. They should be planted in October or November, the earlier the better. Hyacinths for beds or borders in the open ground should be planted at the same time, and about 3 inches below the surface.

Sorts most worthy of Cultivation.—There is no advantage gained by purchasing high priced sorts of Hyacinths—as there are plenty of the old kinds of every shade of colour equally good in quality, and which, being grown in large quantities by the Dutch florists, may be obtained at moderate prices. The undermentioned are all fine, and by no means expensive:—

Double Red or Various Shades.

VEGETABLE PATHOLOGY.—No. XC.

370. Carcinodes (*Canker*). Ash Canker.—One of the most conspicuous cases of canker, and one of the most purely constitutional, is that which occasionally occurs in the common Ash. In soils where the Ash flourishes most, and where it produces the best timber, a few individuals will appear scattered amongst the others without any apparent reason, which in every stage of growth are cankered and deformed. These trees are the favourite resort of woodpeckers and other insectivorous birds, from the abundance of the larvæ by which they are inhabited, though the insects have no share in the production of the disease, however they may aggravate it. In its first stage there is no appearance whatever of insects in the diseased spots, but afterwards when the wood is exposed and partially decayed, the Goat moth and other insects which live on wood find them a convenient place for the deposit of their eggs, or at least the young larvæ recognise in them an easy point of entrance. Accordingly if a diseased truncheon be split in two, more than one kind of larva may frequently be found beneath the spots, though the history of the development from an early stage of growth shows that the insects are a consequence and not the cause of the spots.

371. I have found no trace of the disease on shoots of less than three years old. The first indication consists in a few scattered specks on the smooth bark, sometimes coincident with an imperfectly developed bud, but more frequently entirely indifferent as to position. According to the time which has elapsed from their formation, these penetrate more or less deeply into the bark, sometimes exhibiting a number of scattered diseased specks within its substance, but more frequently presenting a mass of dead bark cells without any intervening living tissue. The spots soon become confluent, and the whole structure perishes down to the wood, which of course ceases to be formed beneath the diseased tissues. The year following the growth proceeds in the remainder of the twig, which thickens where the healthy bark is still attacked, though the disease spreads at the margin, while the wood itself begins to decay. The same process is repeated year after year till the whole bark perishes, and the parts above the spot which is now gouty and deformed ultimately die. The process of decay is more or less speedy, according to the vigour of the tree or the size of the patches, which are at first attached; but from the first attack, if the branch is small, half a dozen years or even less are quite sufficient to induce complete decay, and this sometimes without the agency of insects. When larger branches or the trunk itself are attacked the process is slower, and the cankered spots ultimately attain a very large size. The more usual case presents a crater-like cavity, the sides of which show the annual growth of the bark, each layer slightly exceeding that of the previous year. In more aggravated cases the wood is exposed for many inches, in consequence of which a slow decay takes place, with very partial attempts at the living edge to remedy the evil by covering the diseased patch. In a section before me such an attempt has, however, been made twice, and six or seven new rings have thus been deposited, without however any effectual cure, as the new bark soon becomes diseased, and the layers beneath it require a fresh deposit to shield them from the weather. In the same patch, however, there is a distinct crater in the wood, surrounded by an annular margin due to a growth some six years or more before, on the whole of which the bark is completely destroyed, while the bottom of the cavity exhibits a slow process of decay, by means of which the evil is penetrating every moment more deeply into the solid wood. In fruit trees there may be some object in preserving life, as healthy, or at least the living portions of the tree, may be productive of good and useful fruit; but in the present instance, where timber alone is the object, the produce can be fit for nothing but firewood, and the growth is so slow, that even for this purpose the ground might be occupied to far greater profit. The moment trees are observed to be thus affected they should be cut down at once, as they exhaust the soil no less than healthy trees, and there is not a shadow of a excuse for maintaining them to the manifest loss both of the occupier and landlord.

TRADE MEMORANDA.

Who is Mr. Robert Hancock, of 35, Lower Brook Street, Manchester, who refers to "Mr. J. G. Waite, Seedsman, High Holborn, London?"

And who is Mr. Robert Dickens, 10, Falstaff Yard, Market Place, Manchester?

Home Correspondence.

New or Little Known Plums.—If we had always such a season as the present the proving of new fruits would be a much easier thing than it is generally found to be. The last five or six years have been such bad fruit years, that many persons like myself have no doubt seen reason to change their opinions of fruits, in many cases formed from seeing and tasting a few isolated specimens (perhaps grown on a wall or in an orchard house); now they have trees loaded with fruit grown more naturally. At the same time I have no doubt that the flavour of many varieties has been much injured by the extraordinary dry season, making them taste of the wood and depriving them of the fine juice they would have had if there had been more moisture in the ground. As it may be interesting to your readers, I will give you an account of the varieties which have fruited here, and if others will do the same much information might be elicited not only with regard to the quality of different new and little known fruits, but their adaptation or otherwise to different situations might with certainty be determined. To commence with Plums: my father, in addition to planting large numbers of (Shropshire) Damsons and other Plums, such as White Magnum Bonum, &c., known to bear as standards, planted a few of every variety he possessed at the time to prove them. Many of these, as well as all Cherries which proved unprofitable, were cut down; of those remaining two of the Precoce de Tours were the first ripe; this is usually a bad bearer here, though a nice purple Plum, not large, but good, and as an early variety valuable, though not profitable. Jaune Hâtive, a small yellow Plum, pretty, but almost without flavour, generally bears well; this season it was loaded to excess. White Magnum Bonum very full, generally bears well; the same may be said of the old red Orleans, many of which broke down with the weight of fruit. Greengage a very heavy crop. Gisborne's much resembles White Magnum Bonum, but rather smaller, almost always bears heavily. Our Golden Drop, here generally very full, is only first-rate on a wall, where it is still one of the best; this year it is loaded, but in wet seasons does not ripen well. We seldom see the beautiful, but tasteless fruit of the scarlet Mirabilum; though covered like a sheet with its beautiful blossoms, it is too early, and is for years together cut off by spring frosts; as an ornamental tree it is worth planting. Sharpe's Emperor, a large coarse red Plum, is not even profitable, and ought not to be cultivated, as it is so inferior in every respect to Victoria, a yellowish red Plum, a good kitchen fruit, large as a Magnum Bonum, and the heaviest bearer I have seen. The Winesour is a bad bearer here, and most of our trees were cut down, as also were the Red Magnum Bonum, a really bad Plum. The Caledonian is here large and handsome on a wall; its enormous reddish purple fruit is very striking, but it is a coarse variety. The new variety Columbia is also very large, and similar in colour, but one of the worst we have proved, being coarse and without flavour. The Dove Bank, which has fruited here for the first time, is very like the Caledonian, which has generally been sold for it, but in many respects is very different; unlike that strong growing variety it makes short wood, is a little more purple in colour and of first-rate flavour, from a wall; we have not proved it on standards. Some large trees of Washington, which seldom bear at all (as

the bloom is very tender), have been well worth seeing, being fuller of their large yellow Plums than I ever saw any Plum tree before; but here though handsome they are very second-rate in flavour. The Overall, a new variety with very long footstalks, is a large dark red fruit not yet ripe, the trees are loaded, and it appears likely to be a profitable kitchen variety. Bluker's Scarlet, also a good kitchen sort, though a great bearer, has this season almost missed setting. Jefferson appears a great bearer; it is a medium-sized handsome yellow Plum, just ripe; from a standard it is good but not first-rate; from a wall excellent—in fact one of the best, and only beaten in flavour by the Reine Claude family, of which the old Greengage is the type. What is called Bluker's Yellow Gage is no more like the Greengage than is our Golden Drop in appearance; it is like Jefferson—in fact, may be mistaken for it till tasted, when it will be found greatly inferior; it is a great bearer on a standard. Reine Claude de Bavay is a late Greengage, quite equal to the old variety in every respect, and about a fortnight later; this year it is bearing heavily. Reine Claude Violette, a purple Gage, is one of the finest plums grown—I have often thought superior to its parent. Purple Favourite is not a favourite here; it is quite second-rate in every respect. Rivers's Early Favourite was a very full crop; a nice, rather small, dark purple variety of the Prune de Tours family. Howell's Early resembles Purple Favourite, but is, I think, a little worse. Smith's Orleans from the wall is one of the finest Plums in colour grown, being nearly black and of good size; its quality is very similar to the old variety. Chapman's Prince of Wales is also of the Orleans family, a profitable good red Plum. *J. R. Pearson, the Nurseries, Chilwell, near Nottingham.* [We hope we have read our correspondent's very difficult handwriting correctly.]

Potato Disease.—So much has already been said and written on this subject that I fear what I am now about to record will be little regarded. A remedy for the disease may, however, be accidentally discovered, and as this is purely so it may be found useful. This year I planted on my farm seven different sorts of Potatoes, on light gravelly soil. The Shaws proved the most affected, all partially so, but there was evidently a marked improvement in the produce of former years. Some of the Shaws, however, accidentally got mixed in the setting with the Flukes, generally a late sound useful Potato, and in taking up the few straggling Shaws interspersed with them, I remarked that they were little if at all affected, and this was the more surprising, as my men were taking up the Shaws the same day, and had remarked how much worse they were than the others I had planted. The Flukes had flowered well, and had a large quantity of Potato Apples; the Shaws also flowered and crabbed equally well with the Flukes. I want your assistance now to tell me the reason why the Shaws planted accidentally with the Flukes were so much better than when planted by themselves; I fancy the pollen of the one had mixed with the stamina of the other, and had given some constitutional vigour to the Shaw, which it had lost and did not then possess in itself. The same kind of care is required I imagine in the vegetable kingdom in propagating as is carefully studied in the animal world. If my idea is correct I shall be glad to hear it from you, as I have made up my mind that it would be better to mix the sorts of Potatoes judiciously in the planting, and sort them afterwards; when taken up you will, I maintain, have a sounder and better crop than when planted separately in the ordinary manner. *William Wilson, High Park, Oxenholme, Kendal.* [We do not profess to explain our correspondent's fact. But we can assure him that his pollen theory won't hold water. Pollen can't act immediately; its effect can only be seen in the produce of the seeds affected by it.]

Zinc Weathercocks (see p. 646).—Zinc and copper are both much better conductors than iron; and so far, *cæteris paribus*, more attractive of lightning, though in practice I do not think much difference has been found; nor can much protection be expected from paint. But why not, to make sure, set up a conductor, and carry all the lightning away from the bell-wires directly into the sea by turning out the foot of the conductor, or if too far for that, by aid of a stout iron waterpipe? A pointed conductor, well connected at bottom, will sometimes even prevent lightning by drawing off the electricity from the cloud gradually and silently, and the point may be carried up alongside the stem of the weathercock. *J. Prideaux, Oct. 3.*

Galvanised Wire Trellissing is used here in the conservatory for training climbers upon, and without any ill effect on the plants. I flatter myself, indeed, that it would be difficult to find a house of climbers in greater luxuriance and beauty. So confident do I feel in its adaptibility for training purposes, that a vinery 50 feet long, lately erected, has been fitted with it for training the Vines upon. I have no doubt that such of your correspondents as have not found this wire to answer have mistaken the cause of failure. *H. Howlett, Haverland Hall.*

Lifting Plants from the open ground for Potting.—At this season many plants will be lifted from the open ground for the purpose of being protected in pots through the winter, as well as for flowering in autumn. I allude more particularly to such things as Chrysanthemums and Salvias, which are well known to make the best plants when grown in the open ground, and potted up in autumn. Some recommend giving such things a good watering before lifting them, but this I do not agree with; on the contrary, I let them get as dry as the state of the weather will permit, for then I consider that the sap vessels are comparatively empty, and on the plant being freely watered when placed in its new quarters the thirsty foliage will speedily begin to demand from the roots fresh supplies, which the latter must derive from the moist soil, consequently the whole vital principle will immediately be set in motion. On the other hand, if the plant is fed and gorged with sap before it is removed, there is no necessity created for an immediate circulation of the fluids; as a matter of course, therefore, stagnation of the plant and sourness of the soil are the inevitable consequence. When the foliage is fully charged with sap before removal it must necessarily part with a portion of its moisture before it requires more, so that one or other of the following evils will most likely occur, viz., either the foliage must flag before the roots can be called into action to replace the loss, or if the leaves are kept up by means of sprinkling and moisture in the atmosphere, the roots must remain dormant, and the beauty of the foliage will in either case be seriously impaired. If my theory be correct, therefore, the plan I advocate will be found the safest. *H. H.*

Fluctuations of Temperature.—The morning of Thursday, the 27th ult., was fair and calm, with the wind N.N.W., a direction in which it continued till noon, when it veered round to full N., accompanied by clouds floating slowly to the eastward, and the sun pouring down intense rays of heat, raising a thermometer on a N.W. aspect to 93°; about 3 P.M. the temperature began slowly to decrease, the wind remained in the same quarter, but the clouds indicated symptoms of a change. The night was fine and clear; at 10 P.M. the thermometer indicated 33½°, with every appearance of a change. The following morning the radiating thermometer stood at 26°, vegetation was stripped of its summer beauty, bedding and other tender plants appearing as if parboiled, and half-hardy plants sustained considerable injury, the day following being excessively hot. Now, as I hear of no tidings so disastrous as these from corresponding counties, I am led to believe that the great fluctuation of temperature mentioned above was owing to this place being in a valley surrounded (except to the northward) by huge hills, on which, however, such tender plants as the Heliotrope, Dahlia, &c., are still clothed in summer verdure, although not more than a mile distant. In short, the difference of vegetation on low grounds and the hill tops is very remarkable. *J. R. T., Gardener to G. S. Winkle, Esq., Hucclecote Gardens, near Gloucester.*

People's Park, Sunderland.—Permit me to express my astonishment at the remarks made by your correspondent "J. S." on the 29th ult., regarding this park. Being a native of Sunderland, though at present a resident in the far north, I had heard and read with much pleasure glowing accounts of the beauty of the people's park, but until I came to Sunderland I was much at a loss to conceive how a quarry hole could be converted into a park. A park, however, there is, and permit me to say, and I say it without exaggeration but not without observation, a park unsurpassed by any place of the kind in England. Who Mr. Smith, the gentleman laying out these grounds is, or what are his antecedents I know not, nor do I care to inquire, but I am sure that every unprejudiced person at all acquainted with the place a few years ago, and looking at what it now is, and that at a trifling cost, must pronounce it a perfect marvel reflecting great credit upon the skill and taste of all concerned. Your correspondent "J. S." is certainly in error when he informs you that 3 acres only have been laid out as a park. The fact is there are not less than 15 acres so laid out, and planted with a very choice collection of forest and ornamental trees, and laid out, as far as my judgment is concerned, in the most approved style of landscape gardening. The rubbish heaps grassed over, about which "J. S." writes, are graceful and artistically formed mounds intersected by wide and well gravelled walks, exceedingly pleasing to the eye, suggestive of seclusion, and affording more ample space for exercise than could by any other conceivable means have been obtained. In my estimate of this delightful retreat I am not alone. The inhabitants of the town generally, and also of the neighbouring towns, are loud in their praise, and justly proud of its beauty. I have heard, how far true I cannot say, that some parties are dissatisfied because it is not the product of native skill. If "J. S." is one of these parties, and is seeking to vent his spleen by damaging Mr. Smith he is morally, to say nothing about intellect, vastly more degraded than the poor donkey referred to. However that may be, I am glad to inform you that as there was only one ass tethered so, as far as my information goes, there is only one who will speak of the Sunderland people's park as "J. S." has done. *Medicus.*

Night Flowering Wheats.—While reading Huc's "Empire Chinois," I met with the passage subjoined, which I have translated literally. Is the night flowering of some Wheat plants a fact?—perhaps some of your readers may know and be able to furnish information on the subject. It is a new idea to me. The following is the paragraph alluded to:—"The spirit of observation with which the Chinese are endowed in the highest degree has led them to make a curious remark on the Wheat plant, and one, which in their opinion, is of the greatest importance in agriculture. One of our Christian converts asked us one day if, in France, the species of Wheat which flowered during the night were very numerous. The question was puzzling enough, and we candidly confessed to our questioner that, not being agriculturists, we knew nothing of the number of species of Wheat which flowered during the night; that we had never heard a similar phenomenon spoken of, and that, probably, the cultivators in our country would be themselves much astonished by a similar question. 'Why, no,' cried he, 'your cultivators would not be astonished; they must necessarily know that, otherwise how could they occupy themselves successfully in agricultural labours. Do they sow their fields by chance, without taking any account of the sun and the moon?' We were obliged to confess for the second time our profound ignorance in these matters. Thereupon, our neophyte began to develope to us the most singular of theories on the flowering of the Wheat plant. He told us that the numerous species of Wheats were divided under two great heads—the one whose blossoming began always and invariably during the night, and the other which could flower only with the day. The choice of soil, the time of sowing, and the kind of culture varied according to the species; and he maintained that, for want of knowing these two classifications and conforming to the rules prescribed for each of them, people exposed themselves to the liability of bad harvests. We cannot say to what point one may give credit to this singular observation of the Chinese." ("L'Empire Chinois," par M. Huc, 2me edition, 2nde tome, pp. 361-2.) *A. R. C.* [This story is quite worthy of the gossiping Monsieur Huc.]

What is Cockneyfied?—The judicious remarks on this subject, quoted in your Paper of the 15th September, made me ask myself this question. A vase, a statue, a fountain, or sun-dial, are not necessarily so—can be rarely accused of making a garden look so abroad, but almost invariably make one look so in England, and of course in America. I would describe cockneyism as a feeling for the beautiful of a mind untaught in seeking for it. Thus a statue on rockwork (which may even be seen in Naples) is a case in point; the statue and rocks are beautiful apart, and in their several places, but never can be whilst together, a ruin rising out of a shaven lawn is another case, a smooth-sided canal twisting like a torrent another. Our money-seeking race are taught to make that their study, and not the beautiful; therefore we make money and execrable patterns for design and lose many customers to our manufactures thereby. *Somerset.*

Transplanting at Midsummer.—Permit me to offer a few words in reply to the observations of "An Old Woodman," made on this subject. As he does not endeavour by argument to combat my assertions, and is not going to say that my success was otherwise than is stated by me, I need not occupy space in discussing that point, although I see I might derive considerable support in the matter from your correspondent "G. W. L.," whose letter, No. 3 I think, bears directly upon the subject, both practically and physiologically. The "Old Woodman" says, that no doubt I will find, as he has done, after 40 years' experience, that October and November are the best months for planting. Now, I have discovered, not "in five years," but from time, locality, and circumstances, such as fell but to the share of few men, that October and November are months only "second best" for planting in. Let any one try a thousand or two of Portugal Laurels, Evergreen Oaks, Arbutuses, Hollies, and upright Cypresses in November and June, let the weather be what it may, and then tell us the result; and I will stake my reputation on the success of the midsummer moving, let the weather be ever so hot. Now, I would not be so self-confident were not my experiences founded on years of observation, and I may say on millions of plants, "from the Cedar of Lebanon to the Hyssop that springeth out of the wall. The "Old Woodman," possibly just roused from his lair, "Old Routine," naturally feels disturbed at my statement, which he calls an advertisement; if the writings of other contributors, however, are to be stigmatised as "An Old Woodman" has done mine, an end must soon come to all open and fair discussion on any subject. The following note addressed to me from the Rev. John Cox, of Misterton, will serve to show what success attended some planting done for him by me in summer. He says—"The Holly you had moved for me, May 31st, has lived, and appears to be doing well. It is about 15 feet high and 20 feet in circumference, and had never been moved before. The large Portugal Laurels sent by you on the 11th of June have grown satisfactorily. The Holly when removed did not appear to be well rooted." *John Scott, Crewkerne, Somerset.*

Délices d'Automne Strawberry.—I entirely concur in Mr. Cuthill's excellent remarks on the general cultivation of Strawberries; but I consider his observations inapplicable in the present case. The garden here is in the southern part of the county of Nottingham, in the vale of Belvoir, which is probably one of the driest districts of the midland counties. The soil is of the most tenacious and stubborn character, on the lias formation, but extremely fertile when properly cultivated, producing Strawberries for size, quality, and quantity, equal if not superior to those of most other gardens. As regards the Délices d'Automne it has not experienced any of the disadvantages Mr. C. suggests. It should be borne in mind that I only received the plants last December from Belgium; consequently they were not in the least affected by the autumn of this country, which, however, was one of the driest ever known. The Délices d'Automne being a hybrid from a species of Alpine without runners (*sans coulans*), I expected to see fruit on the early runners of the same year, and which I had taken all pains to encourage. I was therefore rather unfavourably impressed when I saw them run so

freely and vigorously. I could take up at least 50 or 60 well-rooted plants from each original one turned out. I hope the subject will be properly sifted. I scarcely know of any introduction of late years which would have been more acceptable to my employers than this Strawberry. You will therefore judge of my disappointment. *Samuel Bradby, Elton, near Nottingham.*——I am obliged by the notice you have taken of my communication respecting the Délices d' Automne. Shall I be trespassing upon the columns of your Paper if I ask you to make the inquiry, not how many have been disappointed like myself in believing the assertions made concerning it, but whether any one single purchaser has been successful with it, and can announce to the public that he can exhibit now, and shall be able to do so next month, fruit corresponding with what the original advertisement led people to anticipate? I think this will be the fairest and best way of testing the truth of the statements which they made. *Henry Manton, Sleaford.*——I received last autumn 50 plants of the above-named Strawberry which I planted out late in spring in a favourable situation; they were small, but some of them bore fruit in summer of good quality; for some time past I have not been able to understand why such a difference in the appearance of the plants existed, for the greater part of the plants ceased to grow about the middle of last month, but 10 out of the 50 with large glossy dark green leaves have continued to grow, are still in full growth, and two plants out of the 10 have given and are now giving fine fruit of excellent flavour. I now find from the letter of Mr. Makoy, p. 647 (I received my plants from him), that runners of the British Queen Strawberry "got amongst" those of the true sort, and that consequently 40 of my plants out of 50 are of that well-known variety, and that my autumnal Strawberry affair is what is called a "Flemish account" or a "Flemish bargain." I know Mr. Makoy to be, in common with some other Belgian nurserymen, a most honourable man of business; but so much cannot be said of the person who sold him the Strawberries. Is it likely that Mr. Myatt, having a new seedling Strawberry under cultivation, plants of which he was selling at 2*s.* 6*d.* each (the price at which plants of Délices d' Automne were sold), would suffer an old sort, worth one halfpenny each, or 4*s.* per 100, to "get amongst" them? I think not. That Mr. Makoy has been imposed upon there is no doubt; and that he ought to have exercised more care in making his purchase is equally apparent. He has only one duty to perform—he must publish the name of the impostor, so that he may be avoided. *T. R.*

Plant Growing in Mines—The Great Wheal Tor United Mines, some of the most extensive in the county of Cornwall, are situated near Helston, and have connected with them some of the finest steam machinery in the world. A huge 100-inch cylinder engine pumps the water from the main shaft; a new 85-inch cylinder has just been set to work, and there are several other engines in the mines connected with the different operations of procuring and dressing the ores. A novel feature is about to be introduced in connection with these mines. It is believed that the steady and sustained heat of the engine-houses may render them favourable for stove plants; and I understand that the spirited managers of the mines, Messrs. Crease, have sent to the Lea Bridge nurseries for a number of Orchidaceous and other specimens, on the arrival of which trials will be made to ascertain what plants are more peculiarly suited to the engine-house atmosphere. The managers also intend to establish Cottage Gardening Societies in the neighbourhood, for the benefit of the mining and cottage population. About 900 persons are now employed in these extensive mines, which have every prospect of great success. *

Societies.

Entomological, *September 3d.*—J. Curtis, Esq., F.L.S., President, in the chair. Donations to the library from the Royal Society, the Society of Arts, the Entomological Society of Stettin, Messieurs Chevrolat, Guerin-Meneville, Jekel, &c., were announced, as well as 20 species of nocturnal Lepidoptera, new to the Society's collection, presented by Mr. F. Bond. Mr. Lubbock exhibited a number of galls of different kinds growing on Oaks in Kent; Mr. Foxcroft, a number of species of Staphylinidæ, together with Lamia textor and Apamea conigera, from Scotland; Mr. Douglas, specimens of a new Elachista, reared from mines in the leaves of Chenopodium vulgare, Lithocolletes comparella, bred from the leaves of the Poplar since the last meeting of the Society, thus proving that there two broods in the year in the species of this genus, the first having appeared in April; also the very rare Gelechia maculiferella, taken on the windows of his own residence, at Lee, in Kent. Mr. Waring exhibited some remarkable varieties of several species of Geometridæ, recently captured. Mr. Westwood gave a notice of three memoirs, recently published by Dr. Burmeister, 1st, a memoir on the veins of the wings of the Coleoptera, as affording excellent characters for classification; 2d, a monograph on the Mutillæ of South America, of which family a considerable number had been captured by the author during his residence in South America; and 3d, a synopsis of the insects and other objects of natural history represented by Madame Merian in her great work on Surinam, with an identification of the species of which the modern names were given. The president and Mr. A. H. Haliday gave an account of a recent tour in Belgium and Western Germany. At Liege they had visited M. Lacordaire, whose third volume on the Coleoptera is in the press, as well as M. Candeze, who is engaged on a monograph on the Elateridæ. At Aix they had visited M. Foerster, whose collection of minute Hymenoptera is extremely rich and interesting, and at Crefeld they had seen the collections of M. Von Bruck, rich in Coleoptera, and of M. Winnertz, whose memoirs on the minute Diptera have so much enriched the bibliography of that order, and who had invented a very simple microscopic camera obscura for drawing the veins of the wings and other transparent parts.

Garden Memoranda.

Messrs. Veitch's Nursery, King's Road, Chelsea.—This establishment, so interesting at all seasons, is scarcely less so now than in the height of summer, when flowering plants are plentiful. The different houses have just been put in order for the winter, and in doing this their inmates have been so tastefully and skilfully arranged that, although, as a matter of course, few plants are in blossom, their want is scarcely felt. Well-grown specimens, remarkable for fine foliage or elegance of habit, have been liberally introduced among the ordinary in-door occupants both in stoves and greenhouses, and with the best results, the effect produced being at once varied and striking. In a new span-roofed stove, 55 feet in length, and 19 feet in width, which has lately been put up, this is especially remarkable—so much so, indeed, that amateurs, and even the most experienced gardeners, might profit by an inspection of it, exemplifying as it does so well how much may be effected in the way of keeping up a large amount of gaiety, even during the dullest months of winter, by judicious arrangement alone, and the proper disposition among ordinary subjects of variegated and other plants with handsome leaves. Among the latter we remarked various Theophrastas, of which one of the most striking was imperialis, a kind with foliage quite 2 feet in length, and 8 inches broad at its widest part; Cinchona nobilis, a handsome species; a Sanseviera with upright leaves mottled with white; Browneas of different kinds. Gastonia palmata, Aralias, Ficus Leopoldi, Bilbergia gigantea, Brassaciopsis speciosa, Crotons, the charming Cissus discolor, and others, while the red aspect of the different Dracænas gave to the whole life and beauty. Such are some of the materials, which, intermixed with common stove plants, have served to set this house off to unusual advantage. Plants of variegated Pine Apple, which are now being brought forward in tan pits, are also, we understand, soon to be added to the above, which will, doubtless, still further tend to improve the general effect. Among climbers trained along the roof of this stove was a new species of Antigonum sent to Messrs. Veitch from Guatemala by Mr. Skinner. It is a very rapid growing plant, and its flowers are said to be extremely handsome.

The house in which the stove plants were wont to be kept has been altered so as to be suitable for the growth and exhibition of Pitcher plants, of which we need not say Mr. Veitch has the finest collection in Europe. The top of the centre bed has been converted into an open tank, over which the plants are set on inverted pots. The water in this tank is warmed by an iron pipe which has been galvanised to keep it from rusting, and the air of the house is also heated by hot-water pipes. The side shelves are slate; but in a damp house like this they have always a cold, wet, comfortless appearance; to improve this Mr. Veitch has put a neat white painted wooden curb along their edges, and sprinkled a little brown river sand over their tops below the plants, and since that has been done the general aspect of the whole house has been astonishingly altered for the better. It is intended to grow Pitcher plants up the rafters, so that when that has been done sufficiently long to have the roof well furnished with Pitchers, the appearance they will make must be excellent, and this will doubtless become one of the most interesting houses in the place.

The collection of Orchids is in the best possible condition; but, as may be expected at this season, few of them are in flower. One house is filled entirely with Vandas, Saccolabiums, Aerides, white Butterfly plants, and an Angræcum or two; while another is wholly devoted to Cattleyas; and a third to Dendrobiums, Odontoglossums, Oncidiums, &c. Among the few plants now in flower we observed the rare Phalænopsis rosea, Cattleya Harrisoniæ, Miltonia Moreliana, with lilac and deep violet-coloured blossoms measuring quite 4 inches in length; and the true Epidendrum vitellinum majus, with a flower-spike fully 2 feet long, and having on it when we saw it 20 glorious deep rich orange-coloured blossoms.

The arrangement of the show house at the time of our visit was not completed; but we understand it is to be ornamented with some very fine standard Orange trees which have been brought from the Continent for the purpose, as well as with smaller plants in the shape of standards of Jasmines, which are now in flower and deliciously fragrant; Myrtle-leaved Orange trees loaded with fruit, Dracæna indivisa, Norfolk Island Pines, the hardier kinds of Palms, and other fine-leaved plants, which are found to be so useful in the decoration of such houses in winter. The centre of the conservatory at the end of this house is being filled with Camellias; its side wings have recently been heated with hot water and separated from the central part by folding glass doors. In one of the portions thus partitioned off were some remarkable tree and other Ferns, the most striking being perhaps Dicksonia squarrosa and Angiopteris evecta, the latter a noble specimen, nearly filling the whole centre of the place with its handsome spreading leaves. The other wing is occupied by Palms. The centre beds in both compartments have been margined with vitrified masses of brick, which, when over-run with small Ferns and Lycopods, which have been placed on them, will have an interesting appearance.

The main walk down the middle of the nursery has been well drained and gravelled, and flagstones have been laid down its centre as far as the aquarium, or where the traffic is greatest. In front of this water house are two square beds, each containing good specimens of the Pampas Grass, together with Yuccas, and handsome standard Bays, whose tops could not measure less than 5 feet through, and with stems at least 4 feet high. These are indeed noble trees of their kind. Along the sides of the middle walk specimen Conifers have been planted, and behind them beds containing stock of the different varieties. One thing in regard to these specimen Conifers must be said, viz., that although planted out they are in tubs; but the sides and bottoms of the latter are not close, but put together so as to allow roots to pass freely between the staves into the border. This prevents that cramping and corkscrew form which roots confined in pots often take, and which has been justly so much complained of, while it has the advantage of permitting the trees to be moved, packed and sent any distance without danger of the ball being broken. When finally placed in the pit in which they are to be replanted all that has to be done is merely to undo and remove the iron hoops at top and bottom, which were intended for the time to hold the tub together; the wood, if thought fit, may be left in the ground where it will soon rot.

A new pit is being built for young stock of New Holland plants, of which there is a fine collection here, and since our last visit the new orchard-houses at the Brompton Road end of the nursery have been completed, and the trees in them have this year borne capital crops of fruit. With the exception of that on the Stanwick Nectarine, which is not yet ripe, verifying the assertion that it is a very late sort, most of the other fruits have been gathered. Outside of these houses, in the open air, was a large assortment of fruit trees in pots of all kinds, and in excellent condition for this kind of gardening. A new house has also been erected here for the growth of Vines in pots. Its centre bed is filled with tan, and its atmosphere heated by 3-inch hot-water pipes. Under these circumstances Vines grow amazingly fast. Immense quantities of them struck from eyes this spring are 9 feet in height, and well ripened to the very top.

Among rarities, in addition to Wellingtonia, of which three lights of a pit were filled with nice plants, we observed a fine specimen of Eugenia Ugni in fruit, the latter very plentiful and just beginning to colour; Rhododendron californicum, Eurybia alpina, a hardy evergreen shrub; Escallonia pterocladon, Philesia buxifolia, Desfontainia spinosa, a hardy shrub, with fine Holly-like leaves; Laurus aromatica, a greenhouse plant, with fragrant foliage; Abies bracteata and amabilis, Libocedrus decurrens, Thujopsis borealis, and quantities of young plants of Pinus Benthamiana, seeds of which were sent home by Mr. Lobb.

We may add, that in the open grounds until within the last few days the great feature has been China Asters, beds of which have produced flowers measuring at least 4 inches across, and with scarcely a semi-double one among them. These were the French "Pæony-flowered" varieties, which are now so much esteemed.

FLORICULTURE.

Treatment of Cinerarias.—Common as these plants are, yet few manage them well. We too often see tall drawn-up plants, instead of dwarf bushes. Propagation is easily effected by dividing the young offsets from the old plants, and potting into small sized pots; but cuttings are preferable, which should be put in about the end of June, and placed in a cold frame; or, select seed from the best varieties, sow early in the spring, in wide-mouthed pots or pans, and place them where they may receive a gentle bottom heat; and when the seeds have germinated, and the rough leaves are making their appearance, move them carefully into small sized pots, also continue them in a gentle heat, until the weather will permit them to be removed to a frame. Let their position be close to the glass—kept shaded and free from air for a few days; after which give a little air, gradually increasing it until they become comparatively hardened, so that, after a short period, air may be given without engendering any disorder in the plants. Water should be applied moderately, just enough to keep them moist. Never by any means allow them to become thoroughly dry, for the insufficiency of water is the sole cause of that destructive fungus called mildew, which gradually increases, until the plants get into an unhealthy state, and become next to useless. Then how important it is to be on the watch for this insidious foe; for prevention is better than cure, and it is much easier to expel the disease on its first approach than when it has been permitted to ruin the plant. Three things have come under my observation, as regards excluding this encroaching fungus. First, by admitting a free circulation of air, which should be regularly attended to every day, shutting it off at

night. Secondly, as before stated, by attending carefully to the watering. Thirdly, by removing the dead foliage from them, which is also a harbour for green-fly. By adopting the above treatment I have successfully kept this destructive parasite in check. If green-fly appears, with which they are very apt to be infested, fumigate with tobacco. The plants should now require a shift into a larger sized pot, and let the following compost be used: turfy peat, fibry loam, leaf-mould, decomposed cow-dung, and drift-sand, equal parts of each, beaten roughly together, mixing in a little silver sand. Prepare a 6-inch sized pot, with a good drainage, over which place a thin layer of turfy peat, to prevent the soil from intermixing with the sherds. Repot, and again place them in the frame. Water moderately, and the admittance of a good current of air will also have a good effect on them. Let all possible care be taken not to have the roots coiled and cramped by their coming in contact with the side of the pot, which is generally the case after subsisting in the same pot too long. Then, as soon as the roots are penetrating through the soil, let the plants be again repotted into a larger sized pot, using the aforesaid admixture, and be replaced in the same position as before described, keeping them thoroughly clear from aphides by occasionally fumigating. By this time they will have made great progress, and become good sized plants, and those which will not be likely to be overgrown by such a stimulant may have occasional waterings with liquid manure. Cow-dung is the best manure to use, as by it the flowers are made brighter in colour. About the end of October potting should be proceeded with, taking care to pot them into the same soil as that described. A change of soil at this period is highly prejudicial. Six or eight-inch pots should be devoted to the largest plants; and soil rougher than that formerly described. Place them in a greenhouse, close to the glass; thus they will be prevented from being drawn up too weakly. They may be also grown in a frame during the winter, if there is a flue or hot-water apparatus, to prevent the frost from injuring them. Between this and the time of flowering let all means be taken to insure a vigorous growth, carefully tying out, so that the plants may assume a neat and compact form. About the end of February they will have expanded their flowers; then the varieties of colour, long continuance in bloom, and the splendid show which will be formed by them, in the greenhouse or conservatory, at this period of the year when there is little else in bloom, will amply repay the grower for the care which has been bestowed upon them, and any person, by practising the above, may calculate on success. As soon as the bloom begins to decay, and the leaves are turning yellow, less water must be applied. Remove them into a frame, or, if not convenient, out of doors will suit them. As the plants are of an herbaceous habit, they require a period of rest. Some persons prefer growing them entirely in a pit, with a command of heat, which should only be used in case of frost, removing them to the conservatory, or greenhouse, when in bloom. Tie the side shoots out, and give the plants plenty of room. This, with cleanliness, will make them grow in any soil. *G.*

Calendar of Operations.

(*For the ensuing week.*)

PLANT DEPARTMENT.

Conservatory, &c.—In cases where there are many stove plants in this house it will be necessary, in the event of the weather becoming cold and damp, to use a little fire heat; but be as sparing of this as circumstances will allow, particularly if there are other things in the house likely to be injured by being kept too warm. And in this case it will be advisable to dispense with stove plants, even at the expense of rendering the house somewhat bare of flowers, rather than to keep them here and run the risk of injuring other things on their account. Be careful not to over water things brought from the stove, and also to use water at a temperature of 70° or 80° for these; as watering plants with cold water that has just been brought from a warm house injures the young tender roots, shortens the duration of the blossoms, and often ruins the plant. Use weak manure water for Salvia splendens, so as to preserve the plants in a vigorous state, and keep them blooming as long as possible. Give air freely on fine days, and thin out the twiners on the roof, wherever this can be done with propriety, so as to expose the plants to all the light possible. Give attention to securing a plentiful succession of things for maintaining the gaiety of the house during winter.

FORCING DEPARTMENT.

Pineries.—Plants swelling their fruit should be assisted with a brisk temperature, say from 65° to 75° at night, regulating this according to the state of the external temperature, keeping the house rather close on sunny days and allowing the thermometer to rise to 80° or 85° before giving air freely. Also endeavour to proportion the moisture to the temperature, for a high dry temperature is not favourable to the swelling of the fruit, and there is no chance of getting well swelled heavy fruit without plenty of warmth and moisture. Maintain a steady bottom-heat of about 85°, and use every care to keep the soil in a healthy state as to moisture. When watering is necessary, use clear manure-water, and give sufficient to moisten the whole of the soil, and avoid frequent dribblings, for when this system of watering is practised it is nearly impossible to keep the under soil where the principal roots should be in a healthy state. Use the syringe very sparingly, and only to dew the plants, as heavy syringing after this season is apt to keep the surface soil so moist as to render it difficult to judge as to when water should be given. Any young stock growing in pots which may require re-potting should be seen to at once so as to allow of getting them established in their fresh pots, while they can be kept moderately warm. See that the balls are in a proper state as to moisture before re-potting, as neglect of this is a frequent cause of young plants fruiting prematurely. Keep moist and rather warm for a time after shifting, so as to encourage the formation of fresh roots. Vineries.—Should wet weather set in we would advise covering the border of the early house with dry stable litter, fern, or whatever can be obtained most conveniently that will answer the purpose of keeping the border dry. Nothing answers better for this purpose than clean straw, provided the border slopes from the front of the house, and in this case it is easily thatched so as to throw off the wet entirely. But straw is too valuable in most parts of the country to be used for this purpose, and wooden shutters would be found cheaper in the end; nevertheless, where straw can be obtained, it will be found to answer the purpose perfectly. It will also be advisable to cover the borders of houses in which it is intended to keep ripe Grapes for any length of time, so as to prevent the soil getting saturated about the roots. Look over ripe Grapes frequently, particularly in damp weather, cutting out any tainted berries immediately they are perceived, and keep the atmosphere as dry as possible, using gentle fires when necessary with a free circulation of air; but a warm temperature is nearly as injurious as damp, therefore use no more fire-heat than may be absolutely necessary. Let no pot plants requiring watering remain in houses where the Grapes are ripe and expected to hang for any length of time.

FLOWER GARDEN AND SHRUBBERIES.

Unless where alterations are in hand the principal work in this department for the present will be mowing and clearing up of leaves, &c.; and if anything like neatness is to be maintained, this will require daily attention: also see to getting gravel walks thoroughly cleared of weeds and Moss, &c., and roll them frequently when wet, to keep the surface hard and smooth. Continue to afford young stock in pits and frames the most careful attention, and endeavour to get it well rooted and strong without keeping so close or warm as to render it sappy and liable to fog and damp off on the first approach of winterly weather, as is the case with stock got up in heat late in autumn, and then stored away in cold pits for the winter. Therefore admit air freely to all plants that are sufficiently rooted to bear it without flagging. Newly potted-off things should, however, be placed on a gentle bottom heat which will impart a little warmth to the soil and encourage the formation of roots, but sufficient air should be given to prevent anything like weakly growth. Cuttings of Calceolarias, Scarlet Geraniums, &c., may still be put in where the stock is deficient. Scarlet Geraniums will root almost anywhere, but Calceolarias are not quite so accommodating, as cuttings taken from plants in the open ground are very liable to damp off in heat; these, will be found to do very well, however, in a close pit or frame where there is the means of applying a little warmth when necessary to dispel damp. See to securing as many cuttings as possible of any scarce plants which it may be desirable to increase while there is a fair chance of rooting them, and also be prepared to protect scarlet Geraniums and other things which it may be intended to take up and winter, for we may expect frost any time after this season, and if such things can be protected so as to prevent the foliage and young wood being much injured, they are much more easily wintered. Attend to former directions, and lose no time in getting preparations made for the removal of large trees and shrubs, as both the season and the weather are now very favourable for this kind of work; and ground intended to be planted with young stuff from the nursery cannot be turned up too soon.

HARDY FRUIT AND KITCHEN GARDEN.

Look over fruit remaining out of doors frequently, and gather it as it becomes fit, as if left to get over ripe it will be liable to be blown down and bruised should high winds occur; also examine that stored in the fruit room frequently, as there will occasionally be a few decaying fruit found for a few weeks after housing, and these should be removed as soon as they can be perceived. Keep the fruit room cool and airy, in order to allow of the escape of the moisture given off by the fruit, which is considerable for a few weeks at first. Examine Plums, or any other fruit protected by covering occasionally, to see that they are not spoiling. Where it is intended to make any fresh plantation of fruit trees this season, the ground should be prepared at the earliest convenience, and any fresh soil to be used for planting should be thoroughly exposed to the action of the weather so as to have it in a mellow state when wanted for use. If not already done clean and dress Strawberry plantations, clearing away all useless runners, giving a good dressing of manure where necessary, but be careful to select that which is thoroughly decayed, and which can be covered without the necessity of digging deep or injuring the roots. The principal crop of Celery should now be kept rather closely earthed up, using quick lime and soot freely to destroy slugs, and if these are troublesome go over the lines every morning for several successive days, and apply quick lime or pick up the pests.

STATE OF THE WEATHER AT CHISWICK, NEAR LONDON,
For the week ending Oct. 4, 1855, as observed at the Horticultural Gardens.

Notices to Correspondents.

Fruits for Naming. Received *W K*, *Mary*, *S B*, *W C G R*, *W*, and *A Sub.*

Gooseberry Apple: *E T.* This variety is of a yellowish colour when ripe, of large size, and excellent quality as a kitchen fruit. It becomes fit for use in November, and will continue sound and good for months. It is therefore evident that what you purchased under the above name could not have been the true sort.

Hautbois Strawberries: *D H* says—"I have this year had some remarkably fine and vigorous plants of this Strawberry; the bloom was beautiful, and in great quantity, but it all turned black in the eye, and I had not one Strawberry from at least 40 plants. Is there any remedy for this? Being very fond of the Hautbois Strawberry, I am anxious to have them if possible, and I cannot account for the disappointment I have received.—[This variety is what botanists call polygamous, some plants bearing flowers with stamens and pistils combined, others having stamens only. The latter, being male, are of course barren. The male plants are very apt to overrun and displace the others. They should be weeded out, and the perfect ones only saved. The "Prolific Hautbois" is nearly free from this great defect.]

Insects: *S B.* The insects on the Pear shoots are the mussel scale, Coccus conchiformis, very difficult to eradicate, and of which the history, transformations, breeding time, &c., are still unknown. We know nothing more serviceable than scrubbing the bark with a stiff brush, and washing it with hot water.—*A Young Beginner.* We found no insects on your Cineraria leaves, which are blotched as though sucked by thrips or aphis. Try renewed fumigations and subsequent syringing with fresh water.—*E K.* The caterpillars sent are those of the common large white Cabbage butterfly. Those which are transformed into a lot of little yellow cocoons are attacked by the parasitic Ichneumon glomeratus, of which these little cases are the cocoons.—*A Sub.* The insect is the devil's coach-horse, Staphylinus olens. Its jaws are very sharp and able to inflict a smart bite, instilling a little salivary secretion into the wound, which caused the redness in question. Its ordinary food is worms.—*J G.* The maggots found in the tubers of your Potatoes are the young larvæ of the common cockchafer.—*J T A.* Your moth is the common silver Y moth (Plusia gamma). The caterpillar feeds on most plants; it is pale gray with whitish and yellow lines down the sides and back. The moth is very rapid in its flight, and loves the sunshine. *W.*

Names of Plants: We have been so often obliged to reluctantly decline naming heaps of dried or other plants, that we venture to request our correspondents to recollect that we never have or could have undertaken an unlimited duty of this kind. Young gardeners, to whom these remarks more especially apply, should bear in mind that, before applying to us for assistance, they should exhaust their other means of gaining information. We cannot save them the trouble of examining and thinking for themselves; nor would it be desirable if we could. All we can do is to *help* them—and that most willingly. It is now requested that, in future, not more than four plants may be sent us at one time.—*D Y S.* Phytolacea decandra.—*Beta.* It is impossible to make anything of a flower so crushed and withered. It looks like a lump of Eucharidium concinnum.—*Daniel Lovelock.* Impatiens Noli tangere.—*R Champenoune.* Your fungus is Scleroderma vulgare, Fr. The subterranean form has been mistaken for a truffle. *M. J. B.*—*Bella.* Asplenium viride. *S.*—*Diss.* Both are Quercus pedunculata undoubtedly.

Pickling Capsicums: *Sub.* Put them in wide-mouthed bottles, add a little salt, and fill your bottles with vinegar.

St. James's Park: The correspondents who have favoured us with their communications upon this subject will find the question revived very shortly.

Seedling Pines: *A Forester.* It is impossible to say why your Pines have shanked off. Probably they have been kept too damp. The seedlings belong to the valuable Abies Pinsapo.

Stephanotis: *W W.* The fruit is acrid and poisonous.

To Keep Cattle from Damaging Trees: *Sub.* We are unacquainted with any material which rubbed on the trees will efficiently prevent deer and cattle from injuring a plantation from which you have lately taken away the fence, and at the same time do no harm to the trees. Coal-tar, besides being injurious to the bark, is very unsightly, and when dry becomes altogether useless as a preventive against the ravages of cattle. *B.*

Tomato Sauce: *Sub.* Put the Tomatoes, when perfectly ripe, into an earthen jar, and set it into an oven, when the bread is drawn, till they are quite soft; then separate the skins from the pulp, and boil the latter with a few Capsicums, a few Cloves, a little salt and ginger; stir it well in boiling to let the thin part evaporate; bottle it for use. Be careful in boiling it that the saucepan does not spoil the colour.

Vines: *A G.* It is impossible to say what caused the cane of your Vine to split. Such a circumstance occurs under very different conditions; usually on account of the want of power in the buds of the cane to consume the sap impelled into them. Mr. Rivers' work is published by Longman & Co.

Walls: *J H.* There is nothing so good as common black paint for blackening walls. But why blacken them at all? Fruit has not been found to ripen better on black walls than those of ordinary colour.

Misc: Full price will be given for No. 7, 1847, and 27, 1851.—*F Wailes.* The law compels us to stamp the Paper in front.

*** As usual, many communications have been received too late and others are detained till the necessary inquiries can be made. We must also beg the indulgence of those correspondents, the insertion of whose contributions is still delayed.

THE FOLLOWING MANURES are manufactured at Mr. Lawes' Factory, Deptford Creek:—Turnip Manure, 7*l.* per ton; Superphosphate of Lime, 7*l.*; Sulphuric Acid and Coprolites, 6*l.*

Office, 69, King William Street, City, London.

N.B. Genuine Peruvian Guano, guaranteed to contain 16 per cent. of ammonia. Nitrate of Soda, Sulphate of Ammonia, and other Chemical Manures.

THE LONDON MANURE COMPANY'S NITRO-PHOSPHATE OR WHEAT MANURE FOR AUTUMN SOWING.—This Manure, composed of blood, animal matter, and dissolved bones with silicates, is most strongly recommended to the notice of Agriculturists. It contains from 7 to 8 per cent. of nitrogen, in a form yielding ammonia by slow decomposition, and is therefore particularly adapted for Wheat. The quantity required is 2 to 3 cwt. per acre drilled in with the seed. Price, per ton, 7*l.* 10*s.* in London.

PERUVIAN GUANO, FISHERY SALT, and every other MANURE on best terms, strictly warranted.

40, Bridge Street, Blackfriars. E. Purser, Sec.

ARTIFICIAL MANURES, &c.—Manufacturers and others engaged in making ARTIFICIAL MANURES may obtain every necessary instruction for their economical and efficient preparation, by applying to J. C. Nesbit, F.G.S., &c., Principal of the Agricultural and Chemical College, Kennington, London. Analyses of Soils, Guanos, Superphosphates of Lime, Coprolites, &c., and Assays of Gold, Silver, and other Minerals, are executed with accuracy and dispatch. Gentlemen desirous of receiving instructions in Chemical Analyses and Assaying, will find ample facility and accommodation at the College.

BLOOD MANURE FOR WHEAT.

THE PATENT NITRO-PHOSPHATE OR BLOOD MANURE COMPANY.

Trustees.

Abel Smith, Jun., Esq., M. P., 2, Halkin Street, West.
Charles Dimsdale, Esq., Essendon Place, Herts.
Edward Ball, Esq., M.P., 8, Belgrave Road, Pimlico.
Major-Gen. Hall, M.P., Weston Colville, Linton, Cambridge.
John Brady, Esq., M.P., Warwick Terrace, Belgrave Square.

Directors.

Chairman.—Jonas Webb, Esq., Babraham, Cambridgeshire.
Deputy-Chairman.—John Sharp, Esq., Tower Villa, Queen's Road, Regent's Park.
Edward Bell, Esq., Tottenham, Middlesex.
John Clayden, Esq., Littlebury, Essex.
Richard Hunt, Esq., Stanstead Abbot, Herts.
Thomas Knight, Esq., Edmonton, Middlesex.
Robert Leeds, Esq., West Lexham, Norfolk.
Robert Morgan, Esq., 72, Camden Villas, Camden Town.
Thomas Nash, Esq., Great Chesterford, Essex.
James Odams, Esq., Bishop Stortford, Herts.
John Collins, Esq., Middleton Square, Pentonville.
(*With power to add to their number*).

Bankers.—Messrs. Barnett, Hoare, & Co., Lombard Street.
Auditor.—James Caird, Esq., Baldoon, and Sergeant's Inn, Fleet Street, London.
Secretary and Chemist.—James Taylor, Esq., F.C.S.
Solicitors.—Messrs. Kingsford & Dorman, 23, Essex St., Strand.

MANUFACTORY, PLAISTOW MARSHES, ESSEX.

The Directors of the above Company (many of whom are eminent agriculturists), beg to call the attention of their friends and the agricultural community to their Patent Blood Manure, which is composed of Bones dissolved with sulphuric acid, to which is added about 1500 lbs. of pure Blood to every ton of the Manure, carefully dried and prepared for the drill or hand sowing. Being rich in Nitrogen and other necessary ingredients, it is especially adapted for the Wheat Crop, and has been used with the greatest success in all parts of England.

It is a very remarkable fact that the analysis of Blood and the grain of Wheat are nearly identical, as proved by the most eminent chemists; it contains all the elements which plants require, and when properly prepared and applied, will become the essence of vegetable as well as of animal life.

The highly fertilising properties of Blood has been commented upon by Professor Way, and others, and the success of the Blood Manure for Wheat Crops has been fully proved upon all soils, by the practical experience of numerous agriculturists, a few of whom are the following:—

Sir Archibald M'Donald, of Woolmer Lodge, Liphook, says: "The Wheat manure I purchased of you has answered its purpose admirably."

Jonas Webb, Esq., Babraham, Cambridgeshire.—"Your Wheat manure I tried by the side of guano, and if anything it had the advantage, as the quality from it is superior."

Mr. Baker, Steward to His Grace the Duke of Bedford, Park Farm, Woburn, Bedfordshire.—"I used your manure upon a piece of poor land after Peas, and have grown an excellent crop of Wheat."

Mr. Benjamin Goulton, Gedney Marsh, Long Sutton, Lincolnshire.—"I drilled your manure at the rate of 2½ cwt. per acre, along with the Wheat over 30 acres, and although the field is the poorest land I have on my farm, the crop ranked amongst the best I have. I do not know how I can recommend it better than by saying I shall use it much more extensively this season."

Mr. Walter Murton, East Stour, Ashford, Kent.—"I sowed your Wheat manure last autumn, and the consequent increase in the crop both of corn and straw has convinced me of its great utility."

Mr. H. Steed, Nonington, near Wingham, Kent.—"I used Odams' Patent Manure for Wheat last November, and never have I used any artificial manure with such benefit."

Mr. Frederick Robinson, Southery, near Downham Market, Suffolk.—"I last autumn used 2 cwt. of your manure per acre on a piece of fen land; it came up very strong in plant, assumed a most healthy appearance during the winter, and has produced me one of the finest crops I ever grew."

Extract from the *Agricultural Gazette*, 7th April, 1855.—"The Nitro-Phosphate Company throw blood and bones together, and add sulphuric acid, thereby manufacturing a manure, which, as it contains soluble phosphate along with nitrogenous matter, is as nearly perfect, whether for roots or corn, as anything can ordinarily be."

Extract from the *Mark Lane Express*, of January, 1854.—"Amongst the new things which appeared this year for the first time was Odams' Patent Blood Manure; and it is this addition to our fertilisers which falls to our province to review. Blood has long been acknowledged one of the most enriching of all our manures, a proposition the soundness of which has been proved by innumerable experiments. Now that the startling fact has reached the ears of the agricultural public that Peru will be exhausted of Guano in a few years, surely the prospects of an everlasting supply at home will be accepted with some degree of national satisfaction, more especially since the latter is superior to the former in quality."

The Public are cautioned against spurious imitations; as security to the purchaser every Bag is marked "Odams' Patent Blood Manure," and sold only by the authorised Agents of the Company.

OFFICES, 109, FENCHURCH STREET.

Price 7*l.* 10*s.* per ton, free at any Railway or Wharf in London.

Directions for Use.—From 2 to 4 cwt. per acre, according to the condition of the soil. It may either be drilled in with the seed or sown broadcast; if the latter it should be well harrowed in

SMITHFIELD CLUB, 1855.—FAT CATTLE SHOW.—The ANNUAL CHRISTMAS SHOW of FAT CATTLE, SHEEP, and PIGS, will take place on the 11th, 12th, 13th, and 14th of December, 1855, at the Carriage Bazaar, King Street, Portman Square, when nearly 800*l.* will be awarded in Prizes and Medals.

The printed forms of Certificates, properly filled up, must be returned to the Honorary Secretary on or before SATURDAY, November 10th. Prize Sheets and the necessary printed forms of Certificates are now ready, and can be obtained on application to B. T. Brandreth Gibbs, Honorary Secretary, Corner of Half-moon Street, Piccadilly, London.

All communications on the Club's business should bear the words "Smithfield Club" on the outside.

HIGHLAND AND AGRICULTURAL SOCIETY. —EDINBURGH VETERINARY COLLEGE.—The Committee of the Highland and Agricultural Society of Scotland, appointed to superintend the Veterinary College, hereby intimate that the SESSION will commence on WEDNESDAY, November 7th, at 2 o'clock.

The Course of Study includes the following Classes:—

1. Zoiatrics, Veterinary Medicine and Surgery Professor Dick.
2. Zootomy, Veterinary Anatomy & Physiology Mr. Barlow.
3. Chemistry ... ... Dr. Lindley Kemp.
4. Veterinary Materia Medica and Pharmacy Dr. Lindley Kemp.
   Anatomical Demonstrations ... ... Mr. Barlow.

By Order of the Committee,

Edinburgh, Oct. 6. Jn. Hall Maxwell.

COLLEGE OF AGRICULTURE AND CHEMISTRY, AND OF PRACTICAL and GENERAL SCIENCE, 37 and Lower Kennington Lane, Kennington, near London.

Principal—J. C. Nesbit, F.G.S., F.C.S., &c.

The system of studies pursued in the College comprises every branch requisite to prepare youth for the pursuits of Agriculture, Engineering, Mining, Manufactures, and the Arts; for the Naval and Military Services, and for the Universities.

Analyses and Assays of every description are promptly and accurately executed at the College. The terms and other particulars may be had on application to the Principal.

DRAINAGE OF LAND, BOGS, ETC.

MR. HUMBERT, of Watford, Herts, supported by unquestionable references and testimonials, offers his services to proprietors about to execute works of drainage, which he will undertake personally to lay out and superintend, and to supply the forms and attendances necessary to obtain the certificate of the Inclosure Commissioners at a fixed price per acre. Mr. Humbert (having been more than 15 years established in business as a Surveyor and Land Agent) has found that wet heavy soils can be usually carefully and thoroughly drained, with pipes 4 feet deep, and upwards, at from 4*l.* to 5*l.* per acre, inclusive of every expense.

LAND DRAINAGE.

MR. THOMAS SCOTT, Land Agent and Valuer, 5, Charing Cross, London, is prepared to undertake the Planning and Execution of LAND DRAINAGE in large or small quantities, by Contract or on Commission. He has now at work around London steady and well-organised "gangs," under competent Foremen and Pipe-layers.

Mr. Scott is at present carrying out extensive Drainage Works on Crown Lands, which he will be happy to show to Gentlemen desirous of seeing them. Communications addressed to him, as above, will be immediately attended to.—Oct. 6.

THE CONSERVATIVE LAND SOCIETY. FOURTH YEAR.—The third financial year being ended, a favourable opportunity is presented to persons desirous of investing capital or savings at the opening of the fourth year, whether as investors for the sake of drawing half-yearly the guaranteed 5 per cent. interest per annum payable on completed shares and uncompleted shares, upon which a year's subscription and upwards have been paid, and of receiving whatever bonus may be annually declared, or whether as allottees for the purpose of acquiring building land to secure lucrative ground rents. The taking of land is quite optional. No risk and no responsibility. Monthly payments 8*s.* per share. For prospectuses apply to

Charles Lewis Gruneisen, Secretary.

33, Norfolk Street, Strand, London.—Oct. 6.

CARSON'S ORIGINAL ANTI-CORROSION PAINT, specially patronised by the British and other Governments, the Hon. East India Company, the principal Dock Companies, most public bodies, and by the nobility, gentry, and clergy, for out-door work at their country seats. The Anti-Corrosion is particularly recommended as the most durable out-door Paint ever invented, for the preservation of every description of Iron, Wood, Stone, Brick, Compo, Cement, &c., work, as has been proved by the practical test of upwards of 60 years, and by the numerous (between 500 and 600) testimonials in its favour, and which, from the rank and station in society of those who have given them, have never yet been equalled by anything of the kind hitherto brought before the public notice.

Lists of colours, prices, together with a copy of the testimonials, will be sent on application to Walter Carson & Son, 9, Great Winchester Street, Old Broad Street, Royal Exchange, London No Agents. All orders are particularly requested to be sent direct.

"FRIGI DOMO."—Patronised by her Majesty the Queen, the Duke of Northumberland for Syon House, his Grace the Duke of Devonshire for Chiswick Gardens, Professor Lindley for the Horticultural Society, Sir Joseph Paxton for the Crystal Palace, Royal Zoological Society, late Mrs. Lawrence, of Ealing Park, and — Collier, Esq., of Dartford.

PROTECTION FROM MORNING FROST.

"FRIGI DOMO," a Canvas made of patent prepared Hair and Wool, a perfect non-conductor of Heat and Cold, keeping, wherever it is applied, a fixed temperature. It is adapted for all horticultural and floricultural purposes, for preserving Fruits and Flowers from the scorching rays of the sun, from wind, from attacks of insects and from morning frosts. To be had in any required length, 2 yards wide, at 1*s.* 6*d.* per yard run, of Elisha Thomas Archer, whole and sole manufacturer, 7, Trinity Lane, Cannon Street, City, and the Royal Mills, Wandsworth, Surrey; and of all Nurserymen and Seedsmen throughout the kingdom. "It is much cheaper than mats as a covering."

WATERPROOF PATHS.
BARN AND CATTLE SHED FLOORS.

THOSE who would enjoy their Gardens during the winter months should construct their walks of PORTLAND CEMENT CONCRETE, which are formed thus:—Screen the gravel of which the path is at present made from the loam which is mixed with it, and to every part of clean gravel add one of sharp river sand. To five parts of such equal mixture add one of Portland Cement, and incorporate the whole well in the dry state before applying the water. It may then be laid on 2 inches thick. Any labourer can mix and spread it. No tool is required beyond the spade, and in 48 hours it becomes as hard as a rock. Vegetation cannot grow through or upon it, and it resists the action of the severest frost. It is necessary, as water does not soak through it, to give a fall from the middle of the path towards the sides.

The same preparation makes first-rate paving for BARNS, CATTLE-SHEDS, FARM-YARDS, and all other situations where a clean, hard bottom is a desideratum. May be laid in winter equally well as in summer.

Manufacturers of the Cement, J. B. White & Brothers, Milbank Street, Westminster.

CAUTION.

PARKES' STEEL DIGGING FORKS AND DRAINING TOOLS.

Whereas very inferior descriptions of Steel Digging Forks are now manufactured and sold, and I have been informed that purchasers of the same have believed them to be the same as those manufactured by me, and to which the Royal Agricultural Society and numerous Agricultural Societies' prizes have been awarded, I hereby respectfully inform the public that every Fork manufactured by me is stamped with my trade mark "J. P.," and that Messrs. Burgess & Key, of No. 103, Newgate Street, London, are my sole Wholesale Agents, and I have authorised them to replace to the purchaser every Fork of my manufacture found defective; they will also on application send Wholesale and Retail Price Lists, &c., post free. Francis Parkes & Co.

FIRST PRIZE REAPING MACHINE.
NOTICE.

MESSRS. BURGESS AND KEY beg respectfully to inform the public, and particularly the noblemen and gentlemen whose orders they were obliged to decline for this season on account of the manufacture not being fully arranged, that the Royal Agricultural Society's First Prize of 80*l.* was awarded to them for M'Cormick's Reaper, with their patent screw platform, at the trial at Leigh Court, near Bristol, upon the 29th of August last. Amongst the competing machines were Bell's, by Crosskill; Forbush's, exhibited by Mr. Palmer; and Hussey's, with tilting platform, by Wm. Dray & Co. The reports of farmers who have worked the machines during this present harvest, show that the average quantity of Wheat, Barley, and Oats which they cut was from 1¼ to 1½ acre per hour. Two horses work the machine with ease, and the only attendant required is a man or a boy to drive. Further particulars and prices sent free on application.—Burgess & Key, 103, Newgate Street; and 52, Little Britain, London.

DO YOU BRUISE YOUR OATS YET!—One bushel of Oats when Crushed will make two. Great saving OAT BRUISERS, Chaff-cutters, Ploughs, Threshing Machines Flour Mill Carts, Corn Dressing do., Horse and Steam Machinery put up, &c. Book on Feeding, 1*s.*

M. Wedlake, 118, Fenchurch Street, London.

The Agricultural Gazette.

SATURDAY, OCTOBER 6, 1855.

Mr. Northcote has published in the current number of the *Philosophical Magazine* a useful paper on the Function of Salt in Agriculture, to which we beg the attention of our readers. In reference to the alleged power of salt to fix ammonia, it has been understood that the sum of the affinities of muriatic acid for soda and of carbonic acid for ammonia, by which on the mixture of common salt and carbonate of ammonia these substances are enabled to retain the characters which respectively distinguish them, is so nearly equal to the sum of the affinities of carbonic acid for soda, and of muriatic acid for ammonia, by which these salts would decompose each other, that it depends on other circumstances capable of influencing the intensity of chemical affinity, whether these salts shall retain their original characters or assume those proper to carbonate of soda and muriate of ammoniate, into which, on mutual decomposition, they resolve. Such a mutual decomposition would furnish in carbonate of soda a salt more caustic than either of the original substances, and in muriate of ammonia a fixed salt in place of the volatile carbonate of that alkali. It is, therefore, greatly to be desired, in an agricultural point of view, that so cheap a mode of fixing this volatile part of manures should be available—and it is the near balance of the affinities on which such a method depends that the great variety of experience which has been published on salt as a fixer of ammonia depends.

The paper by Mr. Northcote relates his own experience on this subject in the laboratory, and that of other chemists. It appears that M. Barral "exposed to the air for 15 days equal weights of guano, and of guano previously mixed with half its weight of salt: the amount of nitrogen in each being determined at the end of that time, he found that the pure guano had lost 11.6 per cent. of its nitrogen, whilst that mixed with salt had lost only 5 per cent."

This is one of the instances indicating the retaining power of the soda salt over the volatile alkali, and a number of experiments by Mr. Northcote strikingly confirm this inference, correcting, however, the views which have been hitherto held on the subject by attributing the power in question in a great measure to the sulphate of lime present in the common salt of commerce, and showing that this power is not permanently exercised, but that the ammonia there collected is again gradually liberated. This, however, is by no means fatal to the agricultural value of this function of common salt, and Mr. Northcote's results may therefore be considered of great agricultural value. They are as follows:—

"That agricultural salt is a most energetic absorbent of ammonia, both in virtue of its chloride of sodium and of its soluble lime-salt, and that the proportion of the latter especially most powerfully affects its action; but that at the same time its agency does not seem to be altogether a permanent one; it will collect the ammonia, but it is questionable whether it can retain it for any great length of time, because in the very decompositions which happen in order to render the ammonia more stable, salts are formed which have a direct tendency to liberate ammonia from its more fixed combinations. It may, however, retain it quite long enough for agricultural purposes: if the young plants are there ready to

receive it, its state of gradual liberation may be for them the most advantageous possible; and to this conclusion all experiments on the large scale appear most obviously to tend. It is described as an excellent check to the too forcing power of guano; and from M. Barral's experiment we see that it either prevents the too rapid eremacausis of the latter, or stores up the ammonia as it is formed. As a manure for growing crops, all experience and all theoretical considerations therefore show it to be the most valuable; but when employed to mix with manure heaps which have to stand for considerable periods of time, theory would pronounce, as practice has in many cases done, that its power of retaining ammonia under those circumstances is at the best doubtful."

Draining, subsoiling, liming, burning, and the application of light earths and vegetable manures, perform wonders in transforming heavy clay into more porous and friable mould; yet, when all these means of amelioration, chemical and mechanical, shall have been everywhere persevered in, our present dead-fallow districts will still remain by comparison the "strong lands" of the kingdom—demanding great judgment and more than average labour in their tillage management. Chemically the clays are inexhaustibly rich: their physical properties, however, have prevented us from fully developing this fertility; and when we have tried every process for improving their texture, there will still be the problem *how to effect a thorough revolution in their mechanical treatment.*

"Britons" may "venerate the plough," but every observant cultivator of heavy soil can read counts of indictment against it; employing it only until a more perfect implement is supplied him. No one will say that *dragging horizontally* is essentially the right motion for *raising and turning* the soil, and that a tool originally devised for scratching the surface is specially adapted for inverting a deep staple. The screw-wedge implement, improved to the highest pitch of excellence, is (on stiff clays) only a make-shift expedient for applying animal power to an operation which only manual digging has ever yet done well. The plough only *partially inverts*—leaving unburied vegetation peeping from the furrow seams; it only half cuts and divides the soil—leaving slices of such size and continuity as to harden into unmanageable slags requiring weeks for their proper reduction. In effecting this imperfect tillage, it exerts *a detrimental action upon the subsoil,* by the pressure of its cleaving share, and the hard polishing of its sliding sole; and the horse's hoofs also pound and knead both surface and subsoil. Then the principle of twisting up a tough furrow-slice with a screw blade mould-board, and still more of sledging the whole weight of the implement, involves *an enormous amount of friction;* so that a third part of the draught is engaged in simply conveying the plough towards its work. Yet the avoidance of friction is one of the main points in a machine for tilling an adhesive clagging substance like clay. No modification of a drawn plough is therefore likely to be successful. Slight improvements alone are possible while the implement remains fundamentally wrong.

We may here advert to two ways in which the imperfect work of the plough has been sought to be obviated. In Jethro Tull's day, the ploughs cut in all strong land (as they do now) a thick furrow-slice in one whole piece, or but slightly broken; cross-ploughing did not thoroughly divide and overturn the furrows of the first ploughing, but drove them up into heaps, with their surfaces lying in various postures, so that the turf not turned undermost continued to grow vigorously, still matting the slice together with its roots. Heavy drags with huge iron tines in them were next employed to tumble and partially break the great pieces of furrows, but it required months to reduce them to a moderate fineness. Seeing that all this arose from the undue size and solidity of the first furrows, Tull contrived a plough with four coulters, which cut the slice to a great depth into four parts, each of about 2½ inches thickness, and these in turning over broke and fell into many smaller pieces. With this implement, followed by the common plough, &c., he could resolve stubborn ground into a fine seed bed in much less time than by any other means.

Upwards of 30 years ago, Mr. Brown, of Kinwarton, near Alcester, attached a couple of pulverising knives behind the mould-board of a plough, which, projecting horizontally into the furrow-slice, cut and crumbled it, so that on stiff adhesive soil the work had the appearance of that of the spade. This severing and disintegrating of each furrow-slice immediately after it is raised by the mould-board, and before it is pressed into a compact mass by a succeeding one, and so left to dry and harden in a whole piece, is analogous to the manipulations of the gardener, who bruises and pulverises each spadeful of earth as he throws it up from the trench. The knives add about 15 per cent. to the draught of the plough, but they produce a sufficiently fine tilth for the reception of seed, with very little after-use of the harrow—thus mainly avoiding the great injury of trampling and poaching. A full description of this invention is contained in the Royal Agricultural Society's Journal, vol. iii., 1842. Mr. Brown informs us that he still continues to use these knives when preparing land for seed, although they are not required for fallow ploughing.

Both these examples point out the right direction for improvements in tillage machinery: we must discard the longitudinal motion and wedge action of the plough, and *cut up the soil into considerably finer detail.* We *have* an implement answering these conditions, but unfortunately it cannot be worked by either horses or steam, and to employ manual labour for the purpose is thought too expensive, and otherwise impossible for large farms—we mean the *spade.*

If any inventor can construct an efficient revolving digger or forker strong enough to grapple effectually with tenacious clay, to be drawn by wire-ropes from a fixed steam-engine—or, still better, if a very light motive-power can be discovered and made to traverse our fields—we shall then possess the principal part of the machinery of which we are in search. But a few words more upon this subject on a future occasion. *I. A. C.*

THE SUFFOLK HORSE.

The death of the late Mr. Thomas Catlin, of Butley Abbey, occasioned the disposal of his valuable collection of cart horses. At the beginning of the present century the pure Suffolk horse was almost extinct. The late Lord Huntingfield and the late Sir Robert Harland were about the first men in high station who appreciated the value of the breed, and to what at that time was considered the enormous prices which they paid for colts and fillies of undoubted purity may be ascribed the impulse given to our agriculturists not to neglect any longer the development of the fine qualities characteristic of the race—strength of limb, compactness of mould, lightness of carriage, and soundness of constitution. Fortunately, Mr. Thomas Smith, of Parham, possessed an entire horse of unmixed blood, which became the progenitor of all the splendid animals that have since made the breed so renowned. The celebrity of the Suffolk horse, however, beyond the limits of the county, is in a great measure due to the exertions of Mr. Catlin. For a long period of years he had, in common with other gentlemen, devoted much care to the improvement of the stock, but he was one of the first, if not the very first, who boldly challenged comparison with other breeds at the meetings of the Royal Agricultural Society, and this brought it into the repute which it now enjoys throughout England and on the Continent. The high price of 300 guineas for which Boxer, an entire horse, was sold a few years ago to the Duke of Manchester, the high price of 100 guineas for which a foal was recently sold to the King of Hanover, and the numerous prizes gained by the Royal Duke and other horses at both national and provincial meetings, were so many laurels that placed Mr. Catlin in a position of which the whole county of Suffolk was justly proud.

The sale took place on Wednesday, and was conducted by Messrs. Cana & Cook, of Woodbridge. The attendance at one period was between 4000 and 5000 persons. The first lot put up was—Diamond, 3 years, by Duke, dam by Catlin's Old Boxer, in foal to Sultan; gained the first prize at the East Suffolk Agricultural Society's meeting, Ipswich, 1855; the prize as a 2-year old at the Saxmundham meeting, 1854, and was highly commended at the meeting of the Royal Agricultural Society held at Lincoln. The biddings commenced at 60 guineas, from which they made a jump to 100 guineas, next to 125 guineas, and then advanced 5 guineas each bid, until 180 guineas was reached, for which sum the mare was knocked down to Mr. Arthur Crisp. Lot 2, Doughty, 3 years, sire Duke, in foal to Sultan, awarded the first prize at the East Suffolk Agricultural meeting held at Ipswich, 1853, was put up at 60 guineas, and purchased by Sir Edward Gooch, Bart., M.P., at 95 guineas. Lot 3, Darby, 3 years, sire Duke, in foal to Sultan, was sold for 100 guineas to a Mr. Patterson. Lot 4, Depper, in foal to Duke, fell to Mr. Fisher Hobbs at 90 guineas. The remainder of the working horses and mares in foal realised prices below these, as will be seen by reference to the catalogue below, the amounts ranging from 24 guineas for lot 37, Proctor, 10 years, a gelding, to 80 guineas for lot 12, Diamond, 3 years, sire Benham's horse, in foal to Sultan. The 38 animals placed in this class produced a total of 2137*l.* 16*s.*, an average of 56*l.* 5*s.* each.

The first stallion offered—Duke, is described in the catalogue as the best cart stallion in England, 16½ hands high, 9 years old. The following prizes have been awarded to Duke:—In 1848, the first prizes as the best 2-year-old, at the meetings of the East Suffolk and the West Suffolk agricultural meetings; in 1849, the first prizes as the best 3-year-old, at the East and West Suffolk meetings; in 1851, the first prize at the meeting of the Royal Agricultural Society at Windsor; in 1852, and again in 1854, the first prize at the East Suffolk meetings. The auctioneer said the fame of Duke was so well known that it was useless to attempt to say anything about him—he might as well read the history of the great man whose name had been given to the horse! his fame was known all over England and on a great part of the Continent. "Royal Duke" passed into the hands of Mr. Fisher Hobbs, at the price of 255 guineas. The seven lots in the stallion class produced an aggregate of 824*l.* 5*s.*, or an average of 117*l.* 15*s.* each.

The entries in the class of entire yearling colts were six in number. They realised a total of 384*l.* 6*s.*, or an average of 64*l.* 1*s.* each. The next class of animals offered for sale was the brood mares with foals by their side, and here again the choicest lots commanded high prices. The aggregate realised by the 12 mares was 814*l.* 16*s.*, an average of 67*l.* 18*s.* each; and the aggregate realised by the 12 foals was 437*l.* 17*s.*, or an average of 36*l.* 9*s.* 9*d.* each.

In the class of bay teams there were 12 lots, which sold for 511*l.* 7*s.*, an average of 42*l.* 12*s.* each. Five three-year-old fillies and geldings sold for 265*l.* 13*s.*, an average of 53*l.* 3*s.* each. Of the two-year-old fillies lot 94, by Duke, own sister to lot 1 (obtained the first prize at the meeting of the East Suffolk Agricultural Association held at Saxmundham, 1854), was put up at 50 guineas, and after a spirited competition, fell to Mr. Wolton, at 125 guineas. Five two-year-old colts sold for 162*l.* 15*s.*, an average of 32*l.* 11*s.* each; and 10 one-year-old fillies and colts produced exactly the same average, being disposed of at a total of 325*l.* 10*s.* The remainder of the sale consisted of nag horses, colts, and ponies, which call for no especial notice. For the assistance of those of our readers who may feel interested in preserving a record of this remarkable sale, we append a classified summary of the results:—

		Total.	Average.
38	Working horses and mares ...	£2137 16*s.*	£56 5*s.* 2*d.*
7	Stallions	824 5	117 15 0
6	Entire yearling colts	384 6	64 1 0
12	Brood mares	814 16	67 18 0
12	Foals at Foot	437 17	36 9 9
12	Bay mares and geldings	511 7	42 12 3
5	3-year-old-fillies and geldings ...	265 13	53 3 0
7	2-year-old fillies	392 14	56 2 0
5	2-year-old colts	162 15	32 11 0
10	1-year-old fillies and colts ...	325 10	32 11 0
114	Total	£6256 19	

Average all round, £54 17*s.* 8*d.*

Abridged from the Suffolk Chronicle.

EXPERIENCES IN LAND DRAINAGE.

XXVIII. The result of my drainage operations on all descriptions of land has been perfectly satisfactory.—The drainage adopted is on a parallel system.—The prevailing depth of the drains is 4½ feet—I have made no difference in my mode of draining between arable and Grass land.—The direction of the minor drains is with the fall. I have not followed the furrows where the land is in ridges.—The pipes used have been 1½-inch for minor, from 3 to 6 and in some cases 8 inches for mains. No collars or socket-pipes used.—Giving air at places to either main or minor drains has not been found necessary.—No particular number of acres are drained into one outlet, but the size of the main-drain pipes is increased accordingly towards the outlet.—The subsoil is weald clay, in most cases intermixed with iron sandstone.—The mean height of the land drained above the sea level is a little over 200 feet.—The average depth of rainfall in this neighbourhood for the last ten years has been a little over 29 inches. *From Sir J. V. Shelley, Maresfield Park, Sussex.*

XXIX.—My drainage operations on all descriptions of land have been highly satisfactory.—I have adopted a parallel system.—The prevailing depth of the drains has been 4 feet for branches, mains 4½ or 5 feet, occasionally more, as the level requires.—No difference made in draining between arable and Grass land.—The direction of the minor drains has been generally with the fall, and generally following the furrows, which is found to answer best.—The pipes used have been 2-inch for minor, 4 and 5, occasionally 6 for mains. Not often used collars.—No benefit by giving air at places to either main or minor drains. All closed are preferred.—As to the average number of acres discharging at the one outlet, most fields have only one outlet.—The soil and subsoil is various, clay, moist soil, gravel, limestone bottom, &c.—The geological formation is chiefly sandstone, occasionally mountain limestone, millstone grit, &c. The mean height of the land drained above the sea level is between 600 and 700 feet. *Replies from Rev. J. Witham, Lartington Hall, Barnard Castle.*

XXX.—Drainage operations on all descriptions of land have been satisfactory.—The system adopted is parallel.—The prevailing depth of the drains is 3 to 5 and 6 feet.—No difference in the mode of draining between arable and Grass land.—Have followed the furrows where the land is in ridges.—The pipes used for minor and for main drains have been 1¼-inch for minor and 3-inch main; no collars or sockets.—I have never tried giving air at places to either main or minor drains.—The average number of acres discharging at the one outlet is 4 to 6 acres.—The soil and subsoil are clay and loam, and clay with gravelly veins at places.—The geological formation London clay and plastic clay.—The average depth of rainfall in this neighbourhood is 16 to 18 inches.[?]—I have drained extensively for the last eight years, both in Essex and Suffolk. I am of opinion that 3 feet is the best depth for heavy land with clay subsoil, where there is no bottom water. I usually drain 3 feet deep and 18 to 21 feet apart. I do not mean to say that 4 feet deep and 18 feet apart would not be efficacious; I think it would, but I do not think it would be better, and the expense is too great; decidedly 3 feet and 6 yards apart is better than 4 feet and 8 yards

apart. I know instances of deep drains at long distances apart on clay lands, with a small quantity of chalk in them, not running at all after the first year or two. On the other hand, if your subsoil is anything else but pure clay, or intermixed with any veins of gravel or stone, you cannot drain too deep. I have laid the wettest fields perfectly dry by drains 5½ feet deep and 60 feet apart. *S. B. Ruggles Brice, Spains Hall.*

XXXI.—The result of my drainage operations has been more satisfactory upon porous subsoils than on strong soils.—The drainage adopted is parallel.—Its prevailing depth 3 feet strong clay; 4 feet porous soils.—No difference in the mode of draining between arable and Grass land.—As to the direction of drains, I have always followed the course of the furrows distant 20 and 24 feet apart.—I have used for minor 2 and 2½-inch pipes, and for main drains 4 and 5 inch—no collars or sockets.—I have found benefit by giving air at places to the drains.—The number of acres discharging at the one outlet averages eight acres.—The soil a deep loam, part strong, but greatest portion porous—average 1 yard in 20.—The mean height of the land drained above the sea level is 200 feet.—I have nearly drained 1000 acres of the land that I occupy, and have in many instances nearly lost the first crop after the draining; but coming the second time over I find great benefit, the land being much lighter enables me to work it sooner in the spring; and the manures act with more certainty, particularly the artificials, when used on the green crops. *From Mr. Stephenson, of Throckley.*

XXXII.—The result of my drainage is perfectly satisfactory.—The drainage is made on a parallel system.—The depth of drains, minor 4 feet, main 4 feet 6 ins.—No difference made between arable and Grass land.—Direction of minor drains with the fall. No attention paid to furrows where land was in ridges.—Size of pipes for minor drains, 2 inches; and the main, from 3 to 4 inches. No collars or sockets used, the land being too strong.—Never tried giving air to the drains.—The average number of acres discharging at the several outlets varies from 5 to 15 acres.—The soil chiefly gravelly, and subsoil clay intermixed with sand. Geological formation chiefly grit or sandstone.—No means of ascertaining the height of land drained above the level of the sea.—Cannot state what average depth of rainfall is here. *From Captain Harcourt.*

XXXIII.—So far as my experience goes, drainage has been perfectly satisfactory.—The drainage adopted has been parallel always, and generally diagonally across ridge and furrow.—The prevailing depth of the drains has been from 3 to 5 feet, according to circumstances.—I have made no difference in draining between arable and Grass land.—The direction of the drains has been always with the natural fall of the land.—I have used 2-inch pipes for the small drains, and from 3 to 6 inches for the outfalls. No collars or socket pipes.—I have found benefit by giving air at places to either main or minor drains.—10 or 12 acres discharge at one outlet.—The soil is loamy clay, and clay subsoil, with sand occasionally.—The geological formation is red sandstone.—The height of the land drained is very little above the level of the sea. *Thomas Parrington, Lazenby, Redcar.*

XXXIV.—The result of our drainage operations on all descriptions of land has been satisfactory in every case during the last half dozen years (formerly we only drained about 18 inches, but have taken up these and put them in deeper, and where not done, it will have to be).—The drainage is parallel.—The prevailing depth of the drains is from 2½ to 4 feet; never less than 3 feet if I can get the fall, and never more than 4 feet unless it be through rushy ground.—I have made no difference in the mode of draining between arable and Grass land, but not much Grass drained; what has been done was where, from the abundance and luxuriance of aquatic plants, it was highly necessary; in one instance, 10 years ago, a 12 acre field was only drained 2 feet deep; in three or four years Rushes and Sedges disappeared, and it is now a beautiful pasture field.—The drains have been taken across the fall, and where the land is in ridges, across the ridges and furrows.—2-inch horse-shoe pipes principally; main drains, 3½ to 4 inches; no collars; no sockets.—About 7 acres discharge at each outlet.—The soil is warp upon clay; and warp upon moor.—The mean height of the land drained in this neighbourhood and Howdenshire is 4 feet below high water mark, all the county. *From J. Wells, Esq., Booth Ferry, Goole.*

XXXV.—The result of my drainage operations on all descriptions of land has been satisfactory.—I have adopted a parallel system.—The prevailing depth of the drains is 4 feet.—I have made no difference in my mode of draining between arable and Grass land.—The drains have been with the fall of the land, and crossing the furrows where necessary to correspond with the fall to lead more land to the outlet.—I have used 2-inch pipes for minor drains; for main drains they have varied much from 3 to 9 inches. Collars only used where the drains are unsound at the bottom.—I have not tried giving air at places to either main or minor drains to any extent.—The average number of acres discharging at one outlet varies from 20 to 100 acres.—The soil and subsoil are strong loam soil. Subsoil variable; part retentive clay, part sand, gravel, and marl.—The geological formation is red sandstone at various depths, but in all cases below the bottom of the drains.—The mean height of the land drained above the sea level has been about 600 to 700 feet. *From the Right Hon. the Earl Powys, Powys Castle.*

ON SOME POINTS CONNECTED WITH AGRICULTURAL CHEMISTRY.

By J. B. Lawes, F.R.S., and Dr. J. H. Gilbert, F.C.S.

British Association, Glasgow, *September* 17, 1855. Section B.—The authors explained that their subject was necessarily somewhat controversial, for Baron Liebig had recently published a criticism on their experiments and opinions which had been circulated very freely in England, France, Germany, and America. And, from the well merited reputation of that distinguished chemist, his statements and opinions had been echoed almost unexamined by numerous writers, both in the technical and general press. To those statements and opinions, therefore, the authors now proposed to address themselves. They would first call attention, however, to the unfairness of an article on the question at issue in a recent number of the Journal of the Highland Society;* as by so doing they would be naturally led to a proper definition of the subject before them. They explained that it was agriculture, not normal vegetation—that is, the growth of plants under cultivation, and not their growth in circumstances under which every element necessary for their development had to be specially provided. In other words they pre-supposed, as the preliminary conditions of their inquiry, a soil under ordinary cultivation and an atmosphere, each yielding their quota to the result. Indeed Baron Liebig had defined the province of agricultural chemistry to be that of producing more corn, and more meat, and not simply corn and meat, which had been produced for centuries without her aid.

Looking at the subject in this point of view, the authors maintained as a fundamental fact that the composition of agricultural vegetable produce was no direct guide in the choice of manure for the various crops grown in rotation, that which was required being simply the resultant deficit for the artificial production of that margin of produce which distinguished agriculture as practised in this country from natural vegetation, or, from produce obtained for the purposes of export without any return to the land by home manures.

Those of their experiments which had been passed under criticism by Baron Liebig were taken, with others by their side, to illustrate the conclusions to which the authors had arrived. They first brought a summary of the results of their experiments on the growth of Wheat by different chemical manures during many consecutive years; and they maintained that inasmuch as by means of such manures they could raise the produce by from 10 to 20 bushels per acre over the unmanured produce, and indeed far exceed the result obtained by the annual supply of farm-yard manure; that this being the case, the objection of Baron Liebig that their soil was naturally so rich as to be unfit for experiment must be considered to be entirely without foundation. They then illustrated by tables and diagrams of results, by reference to which Baron Liebig had endeavoured to prove the contrary, 1. "That the mineral constituents of Wheat cannot by themselves increase the fertility of land;" and 2. "That the produce in grain and straw is rather proportioned to the supply of ammonia." So far as it went, they fully accepted the above definition of their conclusions as given by Baron Liebig—subject of course to the qualifications which their own papers would indicate. But they utterly repudiated that definition when understood in the manner assumed by Baron Liebig when summing up, and giving his verdict on their opinions at the conclusion of his treatise. They next showed by reference to tables that nitrogenous manures, whether applied in the form of ammoniacal salts, nitrate of soda, or Rape-cake, had a great effect in the increase of produce of Barley also, the next in importance of the cereal grains.

Turning to Turnips, the type of the root crops grown in alternation with the cereals, they submitted that Baron Liebig's statement that phosphates were the only manures which they had found to increase the growth of the Turnip, was directly contrary to the whole tenor of their papers on the subject; in which they had maintained the absolute necessity of matters yielding both assimilable carbon and nitrogen within the soil, for the production of a full amount of the crop in question. They did maintain, however, that phosphoric or phosphatic manures had an action on the development of the underground fibrous feeders of the plant, and consequently on its rapid growth and development, which could not be accounted for by the mere supposition of supplying the actual constituents of the crop to be grown and removed from the land. They illustrated that in their experiments they had the very circumstances provided which had been demanded by Baron Liebig as necessary for the support of their conclusions; and thus it was proved that even where there existed in the land a residue of phosphates from previous manuring, more than would be contained in many heavy crops, still an annual additional supply gave annually a considerable increase of produce. They further pointed out that Baron Liebig had endeavoured to substantiate his objections by comparisons which they showed to be quite inadmissible; whilst one main argument he had founded upon a mere misprint, which reference to the succeeding tables would at once have explained. His argument on the point in question was, therefore, simply reversed.

They next illustrated by a collective table the action of manures on some of the most important crops of rotation, including Wheat and Barley as cereals; Turnips as a root crop, and Beans and Clover as leguminous crops. From this table it appeared, that whilst mineral manures alone had little or no effect in increasing the produce of Wheat and Barley grown respectively in succession, nitrogenous manures on the other hand yielded most striking results. And here attention was called to the fact, that these manures had a similar effect in raising the produce of corn after the exhaustion of corn cropping on the farm of the Earl of Leicester, at Holkham, of which the surface soil was thin and light, but with a subsoil of excellent marl; and also at the farm of the Duke of Bedford, at Woburn, on a soil and subsoil naturally of the poorest possible description. And they further maintained that these results of direct experiment on different soils were perfectly in accordance with the general experience of practical farming all over the country, as to what was the predominant characteristic of corn exhaustion. In the experiments quoted mineral manures were, however, of course found to give a further increment of increase when the nitrogenous manure employed was in excessive quantity.

With Turnips again, superphosphate of lime had given an average increase during a series of years of more than seven tons of the bulb; the addition of alkalies to this had even diminished the amount of increase. Ammonia salts alone, on the other hand, had only given a few hundredweights of increase, instead of more than as many tons by the phosphatic manure. The mixture of both mineral and ammoniacal manures had, however, given a better produce still; though not equal to that which would have been obtained had there been also a liberal supply of carbonaceous organic matter within the soil. Turning to Beans and Clover, nitrogenous manures which had been so beneficial to the cereals, and phosphates which had been so much so to the Turnips, had here comparatively little effect. The constituent of manure which acted in the most characteristic manner with these leguminous crops was the alkali potass; which, when used as a direct manure to soil of a similar description had comparatively little effect in the increase of growth of the cereals or Turnips. In these remarkable facts, though the experiments cited were by no means to be taken as examples of manuring, the authors considered there was afforded an interesting clue to the principles involved in manuring, fallow, and the rotation of crops.

(*To be concluded in our next.*)

* Professor Anderson, on the part of the Highland Society, repudiated its responsibility for the article in question; and Mr. Robert Russell, of Kilwhiss, also disclaimed all connection with its authorship.

ON FATTENING POULTRY.

(*Concluded from p.* 651.)

Chapter II.—The Practice of Feeding.

Section IV.—*Food.*

The food usually selected for fattening poultry is oatmeal mixed either with scalding milk or water; the cause of the superiority of this meal over that of Barley has already been stated. Cooped fowls should be supplied with fresh food three times daily—namely, at daybreak, or as soon after as possible, at midday, and again at roosting time; as much as they can eat should be given on each occasion, but no more than can be devoured before the next meal: should any be left, it should be removed and given to the other fowls, as, if kept, it is apt to become sour, when the birds will not eat it freely. The troughs for the soft meat should be scalded out daily, which can only be done conveniently by having a supply of spare ones.

In addition to soft food, a supply of fresh clean water must be constantly present, and a little gravel must be given daily, otherwise the grinding action of the gizzard, which is necessary to the due digestion of the food, does not go on satisfactorily; the supply of a little green food will be found very advantageous to health; a little sliced Cabbage, or some Turnip tops, or a green turf to peck occasionally, being all that is required.

A variation in the diet will be found very conducive to an increased appetite, and therefore the occasional substitution of a feed of boiled Barley for the slaked oatmeal is desirable. Some feeders have a division in their troughs, or still better a small extra trough, which always contains some grains for the fowls to peck at.

Should the birds be required very fat, some mutton suet or trimmings of the loins may be chopped up and scalded with the meal, or they may be boiled in the milk or water preparatory to its being poured over the food, and the fat of fowls so fatted will be found exceedingly firm.

An objection to this mode of fatting will probably be made—namely, that it is expensive owing to the cost of the oatmeal. In the yard of the writer this objection has been removed by the partial substitution of fine middlings for oatmeal. The plan adopted is to bake the middlings dry, and when made as hot as possible without burning cold water is added, so as to make the whole a crumbly mass. When it is borne in mind that the constituents of fine middlings are nearly the same as those of oatmeal, its value as a fattening food must be admitted; and the writer, from long experience, can speak very decidedly as to its utility when used in conjunction with oatmeal.

In the course of about a fortnight to three weeks at the utmost, a fowl will have attained under this system of feeding the highest degree of fatness of which it is capable, and it must then be killed; for if the attempt be made to keep it any longer in that state, it becomes diseased from an inflammatory action being established, which renders the flesh hard and even unwholesome.

When the fowls have arrived at a state fit for killing they should be kept for 12 hours without food or water, in order that the intestines may be as empty as possible, otherwise the bird turns green and useless in a short time; this is readily managed by killing the bird before feeding time in the morning.

The writer has never found it requisite to have recourse to the unnatural practice of cramming; but as a description of the process may be supposed to be essential to an essay on fattening fowls, an account is inserted.

In cramming, the usual plan is to mix the oatmeal rather solid with milk or water, and to roll it into small sausage-shaped masses, the size of the finger, and about 2 inches long; half a dozen of these are taken, and having been dipped in some liquid, as milk, are placed one after the other in the back part of the mouth of the fowl, when the beak is closed, and the mass gently assisted down the throat by the latter being stroked by the hand before a second is inserted.

The birds are crammed in this way two or three times a day, care being taken to ascertain, by gentle handling, that the last meal has passed through the crop; should this not be the case, more is not given, but some lukewarm water is poured into the mouth to loosen the hardened mass, and prevent the bird becoming crop-bound, an evil which would render it useless for the table.

The fattened Dorkings prepared for the London market by the plans above described are frequently termed capons, but incorrectly, as the operation of caponising has not been performed on them; in fact, it is not required if the birds are cooped before they arrive at maturity; and the extremely severe nature of the operation in fowls, as compared with the corresponding one on quadrupeds, renders it attended with so much risk and loss, that it is very seldom practised in this country.

In conclusion, a few words may be said respecting fattening the other varieties of domestic poultry.

Turkeys.—If well fed, scarcely require any fattening process. Should, however, it be deemed requisite, they may be confined within a moderate range, and liberally supplied with meal and milk, with occasional green food, as recommended for fowls. Barley meal is usually employed, but its inferiority to oatmeal has already been insisted on.

Geese.—Geese are also, if well kept, usually in sufficiently good condition for killing. Should it be required to fatten them, several together should be confined in a comfortable shed, kept very clean by the daily removal of the soiled litter, and they may be fed for a fortnight on Oats thrown into a pan of water; and should they be required still fatter, an additional ten days' feeding on scalded meal or middlings and meal will be found all that is requisite; a little green food and gravel being given at the same time.

When geese are killed very young, they are usually termed green geese; and for this purpose it will be found more desirable to restrict them from the water than to allow them free access to it, as they fatten more readily, and attain a larger size at their early age.

Ducks.—Ducks, from being not at all particular in their diet, require to be confined to clean food some days before they are killed. If they are shut up in a shed, or confined in a small enclosure, and liberally fed with whole Oats in water, and meal slaked, they will be found in a fortnight to have become sufficiently fat for all useful purposes. It is not essential that they should have water to swim in during fattening—in fact, such exercise rather lessens than tends to increase the accumulation of fat.

The early ducklings that realise such high prices in the London markets are of the Aylesbury variety, distinguished by their great size, white plumage, and large pale flesh-coloured bills. If fed with an unlimited supply of Oats placed in a vessel of water, and not allowed much room to swim, the old birds will lay freely in winter; when the eggs should be hatched under hens, and the ducklings liberally fed with slaked Oatmeal and fine middlings, and afterwards with Oats in water. Under this treatment they may be made ready for the table in less than two months, and yield a very remunerative return. Ducklings invariably grow much more rapidly if kept from swimming than if allowed free access to a pond or river. *W. B. Tegetmeier's Prize Essay in the Yorkshire Agricultural Society's Journal.*

Home Correspondence.

Everlasting Pea as a Farm Crop.—Having seen in the *Gardeners' Chronicle* (No. 36, Sept. 8) what appears to me an important letter by Mr. Marshall, Ely, headed "Everlasting Pea," I beg to say that I have tried it as food for cattle, horses, sheep, and pigs, all of which "ate it with a good gusto" on more than one occasion. One fact may suffice for the present as to its importance. On coming to reside here last May, I found in the garden, growing round an old stunted Cherry tree, a fine plant of this variety, and seeing the rapid progress it had made, and feeling the want of early provender, I cultivated it more than ordinarily as regards weeding, only with the view of getting it to bear seed to propagate from. It was then coming beautifully into blossom, which it continued to do as it clambered up the tree till the 8th of August, but producing no seed pods. I then cut it down, and ascertained the roots had occupied one square yard, in the centre of which stood the old Cherry tree, whose stem occupied at least a square of 15 by 15 inches. On weighing the produce, I found it to exceed 30 tons the statute or nearly 50 tons the Irish acre, without making any deduction for the space occupied by the stem of the Cherry tree. It is now one month and two days since it was cut, during which it has made shoots in some cases over 21 inches long. I mean to cut it again in another month, when I will remove both the tree and the plant. The latter I mean to propagate in lines, leaving the plants 3 feet apart every way to admit of better cultivation and manuring when required; and as the plant is one which requires support, I mean to insert beside each young one a pole 6 feet long, branched from bottom to top as supporters, and should the final result be of benefit to the public, they shall have it. In the meantime I may add from my own experience, there are many of our perennial, commonly called "herbaceous plants," used for decorating our flower borders, pleasure grounds, and parterres, that would be highly prized by the rent-paying farmer, if he but knew their true value, which it is the business, I had almost said the duty, of the more intelligent gardener to make known. *Edward Carroll, Cranemore House, Clonegal.*

Growth of Grain.—To ascertain the progress made in the filling of Wheat, I gathered from the same field for five successive weeks some ears of corn, and when quite dry, having selected the most perfect grains from each sample, found—

100 grains, gathered Aug.	5, weighed					
76 "	"	"	12	"	24	per cent. weekly increase
59 "	"	"	19	"	17	" "
54 "	"	"	26	"	5	" "
52 "	"	Sept.	1	"	2	" "

Thos. C. Brown, Cirencester.

Agricultural Statistics.—Mr. Caird, in his evidence given in a late Number, insists on the necessity of having some means of checking the accuracy of the returns made by the persons employed in the collection of agricultural statistics. This necessity is very evident. The value of the statistics depends on their accuracy, and their accuracy can only be ascertained by the application of some test. The plan of collecting agricultural statistics now carried out in Scotland under the auspices of Mr. Hall Maxwell confessedly affords only incidental opportunities of checking the returns. It has, however, worked so well as to render any change, such as the substitution of Mr. Caird's plan, undesirable. By the addition of an efficient check it would be rendered complete. Such a check would require to be both co-extensive with the survey and independent of it; and the one I am about to propose appears to me to fulfil all the conditions required. Every year a change of occupancy takes place over a considerable area in every district over the country. In the great majority of cases when a farm passes from an "outgoing" to an "incoming" tenant, the growing crops are valued, *i. e.*, their produce is estimated by men of skill. These valuations are as near the truth as possible, and we have this pledge of their accuracy that the payment of large sums of money depends on them. A small fee paid for every certified copy of such a valuation delivered to some of the county officials would ensure returns of all the valuations made in every county. These returns would show both the distribution of the crops and the average produce over a certain portion of each county. Whether such average coincided exactly with the true average of the whole crop would depend in some measure on the extent of the area over which the valuation extended, which would vary from year to year, but the individual farms being as it were taken at random, would afford a pretty fair average sample of every county. The valuations are generally made on the eve of harvest, and as the compilation of the returns would not involve much labour the averages deduced from them might be published before or shortly after the conclusion of the harvest. The plan proposed might be carried into execution at a trifling expense, and it would be valuable as affording an independent estimate which would act as a check on the annual "stock taking" of the crops of the country, which we may now look forward to with some degree of confidence. *B. D. T., Sept.* 28.

Smutty Wheat.—I should be very glad of your advice in the management of a crop of Wheat badly infected with smut. A large portion of the ears although looking well at first sight are filled with a black powder of a fetid odour, and when it is threshed this dirties and fouls the sample so that it appears of the colour of Coffee on the barn floor. I have tried washing it, and this seems to clean it if it could be dried effectually on a large scale. I should like to know what is the best course for me to pursue, so that I may sustain as little loss as possible. It was steeped in the ordinary way in urine and dusted with lime, but I think the urine was hardly stale enough. I may mention that a neighbour had a field sown with his own seed infected, while a field sown with seed from another farm was free of the disease. Any information in your Paper will oblige. *A. H. F. C.* [Millers get rid of it by a machine which beats and crushes the smutty grains and blows them out.]

Societies.

Tipperary.—At the annual dinner of this Society, the following remarks were made by Lord Stanley on the advantages of agricultural societies to those who were members:—He had been going about the farmers for the last few days, and he found that many were not aware of the extent, scope, or what might be expected from the exertions of the Society; but he was certain they would soon perceive the beneficial effects of its operations. In England the effects of such operations, which had increased there greatly within the last few years, had given a decided impetus to agricultural science, and the improvement consequently was universal. Take an isolated case—a farmer well to do remained at home, content with what he had, and heedless as to how the world went on, unaware that there was any farm superior to his own, or any system of agriculture better than that which he and his neighbours had acted on. Not so with the farmer who had become acquainted with what was passing beyond the limits in which he resided—who knew what had been done to improve the soil, to improve cattle, to advance farming in every particular. The last-mentioned farmer, actuated by that principle of human nature which will not permit the mind to rest where superiority is seen to exist, without an endeavour to emulate or excel, must endeavour to improve; with eyes and ears open, he returns to farm with a determination to do what he can to make his farm as good as that of which he has heard, or which he may have seen; he finds that he has not been so very improving as he had imagined, and he sets about remedying defects of which he had no knowledge before. He would not speak from imagination or from fancy—he would tell what he had seen and what they had seen, not only within the last few days, but years ago. They enjoyed an unparalleled climate and a soil the most abundant in the world. They had seen fields and farms divided 8, 9, 10, 12 yards from side to side, with fences which were not only wasting all the land that might be used profitably, but a nursery for all those weeds which overran the fields, and for those blazing flowers of red weed which they knew so well and which appeared like an overgrown crop in some localities. He had seen the farm-yard so well planned that all the refuse and manure of the yard and the pig-stye drained into it, thus not only wasting the manure which might be placed so profitably to account, but poisoning that water which might be a source of health and cleanliness to himself and to his family. He had seen whole families living in rags and in want on a miserable patch of land which was not sufficient to afford them sustenance for three months in the year; and they lived on that wretched patch in that misery and destitution, because they preferred this "dignity" of occupying land to the labour of earning a livelihood from others who could afford them employment. He did not talk of introducing costly and cumbrous machinery at weighty expenses, such as they had in England. It would be difficult at any time to introduce machinery of that kind—their farms were too small for it—and they would continue, he believed, always too limited for the employment of such machinery as that to which he referred. There were evils to be remedied, but they were not of a nature that could not be easily removed by the application of that common sense which was so natural to the Irish people. It was a calumny to say, as some had said, that the peasantry of Ireland were naturally idle; he did not believe that—he repelled the calumny. Who was it that made the railway? Who was it that dug the canal? Who was it that did all the hard work that was done in England? Who that cleared the new lands of America and removed the forests? Who did all these things? In nine cases out of ten, he was prepared to answer, it was the Irish peasant. Who had improved every country in the world but his own? If he went back to causes for this state of things, he could, he repeated, find them—but in stating them he should say something that would not be agreeable to all, or practically useful at the present moment. He believed that much of the misery they had to deplore was caused, not by one class, but by all classes, and that all were equally in fault. He would say, let bye-gones be bye-gones. He believed that a new era had opened for Ireland, and that they would now consult their own duties by taking immediate advantage of the advent.

Reviews.

Little Millie and her Four Places. By Margaret M. Brewster. Hamilton, Adams, and Co.

This is a story book addressed to servant girls—intended professedly for their benefit, though after reading it we should have judged it adapted rather for the correction of their mistresses. We believe there are few who rightly understand the minds of the poorer classes whom they attempt to teach. In order to give those below us a lift forwards we must place ourselves on their level; and though many kindly disposed people seek their society with this view they fail, it would seem, to get real insight into their prejudices, difficulties, and trials. There is many a cottage home where all is mismanagement, and most of its experience misery, because those who ought to guide the house with discretion know not how to make it better and happier. But when their richer neighbours have gone to visit them their circumstances have been looked upon with unaccustomed eyes, and it has not been seen where aid was really wanted, or how cottagers may be essentially and permanently benefited by opportunities of helping themselves. We are glad, however, to see this little volume from the pen of Miss Brewster. It addresses an introductory chapter to girls at school, and is no doubt intended in all benevolence to benefit this class, for which school teaching has hitherto proved very inadequate. Something more like practical and bodily experience seems needed besides book learning, and this Miss Brewster undoubtedly sees; but she has evidently made her book too like a novel, and we fancy she would see less refinement of sentiment in the generality of servant girls than she gives us in the fancy character of "little

Millie." She will often, indeed, find in everyday life sound sense and steadfastness of purpose, though very uncultivated and needing more than romance for education; but while we cannot too highly value the deep Christian feeling which Miss Brewster makes most truthfully the basis of all solid good in character, we confess we think her book shows too much experience in the construction of a sentimental love tale to be very useful in the matter-of-fact business of educating servant girls.

Miscellaneous.

Food Markets, Prussia.—In the meantime a nearer danger is recognised in the high price of provisions, for no rebellion is so bad as the rebellion of the stomach. Three years of inundations and wet, with harvests below the average, have exhausted the stocks of grain in hand all over the country; epidemics and sickness of various kinds have reduced the number of labouring hands that might house and thresh the present harvest; so that the corn that really has been garnered in this year comes but sparingly to market; what was not housed some weeks back is now laid by heavy rains, and will probably be lost. All import from the Black Sea and from Russia is entirely at an end. To meet this emergency the Government has wisely suspended, for the third year, the import duties on corn, and has made arrangements for the supply of the army by large purchases in the United States, which are understood to amount to 5,000,000 thalers. Thus the prices in the home market will not be run up by having Government entering it as a buyer. In the meantime every other product of the land, whether direct or indirect, has attained a price that drives housekeepers distracted and leaves poor people very hungry. In addition to bread, fodder of all sorts, meat, butter, and oil (Rape oil), which is here a considerable article of expense, seeing that no candles or other succedaneum are burnt, make living very difficult. Rents have risen also, but, of course, from widely different causes. This is the subject which excites the most attention here just now, to the exclusion of Sebastopol, and, still more easily, of the elections. As, according to Mr. Cobden, Prussia is the brain of Germany, and all the world knows that Berlin is the metropolis of intelligence, Athens on the Spree, it may not be uninteresting to learn what steps are taken to procure a supply of cheap meat for the capital. In the case of cattle imported, so heavy a duty is laid upon them per head—one forming so large a proportion of the entire value of the beast at the frontier—that few persons are to be found adventurous enough to import; and add to the above that on those parts of the frontier where the cheapest cattle are to be had a three weeks' quarantine is imposed, for fear they should bring in with them a murrain. When the duty has been paid and the quarantine undergone, and the expenses of transport up to the capital defrayed, an *octroi* at the gates of the city must be paid of so much per head equally for lean and fat, large or small beasts. Such cattle breeders as can choose another market naturally avoid Berlin, rather than risk this further outlay, which practically puts them into the power of the buyer, as compelling them to sell rather than drive their cattle back and lose the *octroi*. The authorities who levy this impost would willingly show some indulgence, but the butchers here, who possess more cunning than capital, and are hardly more numerous now than they were a century back, refuse to deal for any cattle on which the charges have not been previously paid, so as to have the whip hand of the seller. The supply of meat is thus made scanty, bad, and dear, for the guild and trade corporation institutions with which the liberty movement of 1848 has blessed us enable the butchers to prevent any due increase of their own numbers in proportion to the increased population; thus they can prevent journeymen from becoming masters, and they can prevent masters from taking more than a certain small number of assistants and apprentices; they can prevent any capitalist from entering the business by their law that no one shall be master who has not served his time, &c. In the meantime the Berliners have to pay three times as much for their meat as their friends who live 10 miles off on a line of railway. *Times.*

The Cheese Manufacture.—Mr. White, of Warrington, writes to the *Times* as follows:—Thousands, I doubt not, are ignorant of the fact that the cheese they eat (and much of the butter also, especially in winter) is artificially coloured; others probably know that colouring is employed, but fancy that it is necessary, or that it improves the flavour. Now I wish to inform the first of these parties that all cheese that has not the appearance in colour of milk or cream is coloured; and both that the colouring matter is not only useless but very objectionable. Before entering further into the discussion of this subject I will quote from my own account of Cheshire cheese making, which appears in the Royal Agricultural Society's Journal for 1845, the description there given of what cheese-colouring is—

"This ingredient is, or should be, annatto (or annotto), the produce of the bixa orellana of Linnæus. It is, I believe, chiefly imported from the West India islands, and used for dyeing. The colouring commonly used in cheese-making is prepared by manufacturers in this country for the purpose. It gives the cheese that amber appearance which is unfortunately required in order to please or deceive the eye of the London consumer. For Manchester and Liverpool markets and for home consumption the Cheshire farmer rarely uses it in his cheesemaking, as it is well known it does not improve, but, if an inferior article is bought, and especially if much be used, it may deteriorate the flavour very much. Those who wish to be enlightened on this subject would do well to read the 'Essay on Cheese Colouring,' written by Mr. Whitley, of Stretton, published by Mr. Ridgway, in which it is clearly proved that the greatest bulk of the cheese-colouring used in this country is only an imitation of annatto, but sold by that name, and consisting of such ingredients as turmeric powder, potash, and soft-soap or train oil, well mixed to form a mass, along with a little real Spanish annatto."

Now, in the first place, I would ask, are our London friends or any others willing to have such compounds as these administered to them, although only in homœopathic doses, for I can assure them it is entirely their own fault that they are so administered? The dairymaids will gladly give up infusing this nauseous compound into their cheeses whenever the London cheese-factors ask them to do so; and I doubt not the factors will as willingly give up buying coloured cheeses whenever their customers (the consumers), are content to give up eating them. Even admitting that the colouring matter is a genuine preparation from annatto, it is a most disagreeable, not to say disgusting, thing, both to the smell and taste, and has the further objection of being an expensive article, the retail price being now 7*s.* 6*d.* per lb. It is estimated that 1 lb. is sufficient for colouring a ton of cheese, but I have no doubt in many dairies much more than this proportion is used. In Gloucestershire the estimate formerly was 1 lb. for half a ton of cheese. As it is not improbable but that more than 6000 tons of coloured cheese are made in Cheshire at least 6000 lbs. of colouring matter is required, and will cost 2250*l.* This amount is no doubt trifling when compared with the value of the cheese, but the absurdity of the thing is that it is so much money indirectly paid by the consumers in London and elsewhere, and imposed upon themselves, in order that they may have the gratification of eating an adulterated article. I beg to add that I am in no way interested either in the cheese trade or in the manufacture of cheese, beyond my connection with estates in Cheshire as a land-agent, and I believe the opinions I have expressed are those held in common with many respectable agriculturists in Cheshire and in other counties. *Henry White, Warrington, Sept.* 17.

Calendar of Operations.

OCTOBER.

Cheshire, *Oct.* 2.—After more than seven weeks of as fine harvest weather as can well be remembered, the corn and second crops of Clover, with but few exceptions, have been secured in the best possible condition, and the gloomy anticipations of sprouted corn, arising from the fact of the crops generally having been laid to an almost unprecedented extent, have long been dispersed. The Wheat crop, however, as was predicted early in July, will prove deficient in yield, as will Barley also, but the fullness of the crops may in some measure make up for it, although we can hardly expect an average yield per acre, which after all is the true test of the crops. Oats appear to have been the best crop of the three, and we hear of Beans being very productive where they are drilled and the intervals kept clean by scarifying, hoeing, &c. The rain within the last few days has greatly improved the appearance of Mangold Wurzel and Turnips, and also the pastures, and there is now every prospect of the two former being tolerably fair crops. Winter Potatoes, which are now being raised, appear to have less disease than for many years past, and the crop generally is more abundant than it has been of late years, and the quality too is excellent; perhaps the foregoing remarks will apply more strictly to the driest and best Potato soils, as occasionally we do hear serious complaints of the disease in some localities. The teams are now busily engaged in preparing the Oat lea or other ground for Wheat, and on the strong clay land Wheat sowing is about commencing. Store pigs are very scarce and dear, owing, it is supposed, to the severity of the late spring, which destroyed many of the young litters. The "pleuro-pneumonia" is not so prevalent as last year, but we are grieved to say it still lingers in some localities to an almost ruinous extent to the dairy farmers. *W. P.*

Hexham, *October* 2.—The weather has been all that could be wished for securing the crops, which in this district are now very generally under "thack and rape." Notwithstanding the favourable weather, the harvest has been, owing to the unequal ripening of the corn, a long one—rather over a month. There has been an occasional shower, but no rain to do damage since harvest commenced, and both Turnips and pastures are suffering very much in consequence. The heavy frost rime of the 7th ult. completely destroyed the Potato shaws, but as they were generally ripe or nearly so we hope the roots have escaped hurt, and we are still free of blight. Since finishing the carrying of our crop we have been "skimming" our fallows, using for that purpose our ordinary ploughs with a very wide feather on the share, taking a furrow of about 2 inches deep, and 10 or 12 broad. After harrowing and gathering the Couch Grass the usual winter furrow will be given. The day labourers and boys have been engaged in completing the thatching and "shaving" the stacks, which last operation we find to pay, especially with mown corn, where you have necessarily more heads in the bottoms of the sheaves. Your Wester Ross correspondent seems to have a decided advantage over his southern brethren, and, at the rate he mentions, reaping machines would be of little use to him; we would be inclined to infer from the quantity cut—an acre and two-thirds per day for each scythe—that the crop has not been heavy. With the exception of two fields our crop is by no means a bulky one, yet even our piece men did not cut nearly so much, and the cutting, binding, and stooking cost us 11*s.* 2*d.* per acre on an average. One field cost us 15*s.*, but it was much laid, and about 70 full stooks per acre. Wages have ranged from 17*s.* to 21*s.* per week, with food for men; and from 10*s.* to 14*s.* without food for women.

Notices to Correspondents.

Lime: *J G.* We should apply over the Clover stubble 40 bushels an acre of lime, and if it could have been made into a compost with any vegetable refuse for some weeks before the application to the land, so much the better. The quantity recommended ought of course to depend on the period of the last application of the kind, which we do not know.

M.-General Arbuthnot's Wheat: *To Correspondents.* Having received numerous applications from gentlemen requesting to know if they can be supplied with seed Wheat of the sort called Tiney's Success, M.-General Arbuthnot begs to refer them to his bailiff, Woodford House, Thrapston.

Peat for Kilns: *A Y* asks for information, founded on experience, as to the utility of wood or peat as a substitute for coal in the burning of lime or drainage tiles, particularising the proportions of each to produce a given heat. The articles "Bricks" and "Tiles" in "Blackie's Cyclopedia" give information on the general subject of burning these articles.

Wild Parsnip: *Liverpool.* We do not know how to obtain the seed of this plant in any quantity, unless it be by offering a reward to the school children in your neighbourhood for ripe heads of seed.

WARNER'S 4½-inch IMPROVED LIQUID MANURE PUMP, with Ball Valve, fitted with 1½ inch Brass Union for attaching flexible suction, with strong wrought iron Straps for screwing on to any ordinary Water-butt or Cart, as shown in drawing.

Price of Pump and Union, 50*s.*

1½-inch Flexible Rubber and Canvas Suction for ditto, 3*s.* 6*d.* per foot.

1½ Gutta Percha Suction, 1*s.* 6*d.* per foot.

WARNER'S IMPROVED LIQUID MANURE, OR GENERAL PORTABLE PUMP.

The valve is a ball of imperishable material, and cannot clog in action. The barrel is of galvanised iron, not likely to corrode, and can be raised or lowered at pleasure. The legs will fold together, and the whole may be carried on shoulder to any pond or tank required.

Price of 4½ in. Pump, with legs, 3*l.* 3*s.* The barrel is 27½ in. long, and the legs are 5 ft. high.

1½ inch Gutta Percha Suction Pipe, 1*s.* 6*d.* per foot.

1½ inch Flexible Rubber and Canvas Suction Pipe, 3*s.* 6*d.* per foot.

May be obtained of any Ironmonger or Plumber in town or country, at the above prices, or of the Patentees and Manufacturers, John Warner & Sons, 8, Crescent, Jewin Street, London.

Every description of Machinery for Raising Water, by means of Wheels, Rams, Deep Well Pumps, &c.; also Fire and Garden Engines, &c.—Engravings sent on application.

WARNER'S PATENT VIBRATING STANDARD PUMPS.

PATENT CAST-IRON PUMPS, for the use of Farms, Cottages, Manure Tanks, and Wells of a depth not exceeding 30 feet.

Diameter of Barrel.	Length of Barrel.		£	s.	d.
2½ in. short	1 ft. 7 in.	Fitted for lead, gutta percha, or cast iron flanged pipe, as required.	1	12	0
2½ „ long	3 „ 3 „		1	15	0
3 „ ditto	3 „ 6 „		2	12	0
3½ „ ditto	3 „ 6 „		2	18	0
4 „ ditto	3 „ 6 „		3	5	0
2½ „ short, with 15 feet of Lead Pipe attached, and Bolts and Nuts ready for fixing			2	12	0
2½ in. long	ditto	ditto ditto	2	15	0

The short barrel Pump is very convenient for fixing in situations of limited height and space, for the supply of coppers and sinks in Wash-houses with soft water from underground tanks, or in Hot, Forcing, and Plant Houses; they may be fixed, when desired, under the stage.

May be obtained of any Ironmonger or Plumber in Town or Country, at the above prices, or of the Patentees and Manufacturers, JOHN WARNER AND SONS, 8, Crescent, Jewin Street, London.

Every description of Machinery for Raising Water, by means of Wheels, Rams, Deep Well Pumps, &c.; also Fire and Garden Engines, &c. &c.—Engravings sent on application.

OAT-CRUSHING AND BEAN-SPLITTING MILL (Turner's No. 5).

This Mill is recommended to the use of every person keeping a Horse, as superior for efficiency, durability, and ease in working to any manufactured. Two bshls. of crushed corn afford more nourishment both to old and young horses than three bushels of uncrushed!

Price £5 15*s.* 6*d.*

Made and Sold by E. R. & F. TURNER, St. Peter's Iron Works, Ipswich.

ROYAL AGRICULTURAL SOCIETY OF ENGLAND. MEETING AT CARLISLE, JULY, 1855.

First Prize Awarded to

RICHMOND AND CHANDLER'S No. 3 B CHAFF MACHINE, Price £7.

All the various modern Implements of Agriculture manufactured on the most scientific and improved principles, suitable for home use and exportation.—Address, Richmond & Chandler, Salford, Manchester: and 32, South John Street, Liverpool.

☞ Catalogues Gratis.

HORTICULTURAL BUILDING AND HEATING BY HOT WATER.

AT THE LOWEST PRICES CONSISTENT WITH GOOD MATERIALS & WORKMANSHIP.

GRAY & ORMSON, DANVERS STREET, CHELSEA, LONDON.

GRAY AND ORMSON, Danvers Street, Chelsea, having had considerable experience in the construction of Horticultural Erections, which, for elegance of design, good materials, and workmanship, combined with economy and practical adaptation, cannot be surpassed by anything of the kind in the country, are in a position to execute orders on the lowest possible terms.

G. & O. have been extensively employed by the Nobility, Gentry, and London Nurserymen; and they can with the greatest confidence give the most satisfactory references to all by whom they have been favoured with orders. Their Hot-water Apparatus is also constructed on the most approved and scientific principles, for all purposes to which the application of Heating by Hot Water can be made available.

COTTAM AND HALLEN, Engineers, Founders, &c,

2, WINSLEY STREET, & 76, OXFORD STREET, LONDON.

A SHOW ROOM DEVOTED ENTIRELY TO ARTICLES OF HORTICULTURE.

ILLUSTRATED CATALOGUES UPON APPLICATION.

Conservatories	Mowing Machines	Hand-glass Frames	Garden Engines	Flower Sticks
Greenhouses	Fountains	Game Netting	Do. Syringes	Garden Bordering
Hot Water Apparatus	Ornamental Wire Work	Hurdles	Do. Rollers	Watering Pots
Garden Vases	Flower Stands	Garden Chairs	Flower Labels	Garden Arches, &c.

IRON HURDLES, STRAINED WIRE FENCING, GAME NETTING, &c.

AGRICULTURAL LIST UPON APPLICATION.

EVERY DESCRIPTION OF PLAIN, ORNAMENTAL, CAST AND WROUGHT IRON, AND WIRE WORK,

EXHIBITION PRIZE MEDAL GATES AND ENAMELLED MANGERS.

SLATE WORKS, ISLEWORTH, MIDDLESEX.

EDWARD BECK MANUFACTURES in SLATE a variety of articles for Horticultural purposes, all of which may be seen in use at Worton Cottage, on application to the Gardener, Sundays excepted.

Priced Lists of Plant Tubs and Boxes forwarded on application.

THE HYDRAULIC RAM will raise water, without manual labour, to any height, where a small fall can be obtained.

PARSEY'S PATENT REVOLVING PUMP lifts three times the quantity of water with the same labour, than any other Pump.

Fire, Garden, Deep Well, Liquid Manure, and all other Pumps.

Fountains of every description erected; Rockwork, Grottoes, &c.

Hose Pipe of every kind for watering Gardens.

W. F. ROE (late FREEMAN ROE), Hydraulic Engineer, 70, Strand, London.

FRENCH MODERATOR LAMPS.—A very large and superior stock now on sale at DEANE, DRAY, AND CO.'S (Opening to the Monument), London Bridge.

Established A.D. 1700.

HORTICULTURAL WORKS AND HOT-WATER APPARATUS MANUFACTORY.

KENSAL GREEN, HARROW ROAD, LONDON.

JOHN TAYLOR AND SON beg to call the attention of the nobility and gentry to the very superior manner in which they Erect all kinds of Conservatories, Vineries, Greenhouses, &c., combining every improvement with elegance of design, and durability of materials and workmanship.

Their VENTILATING APPARATUS for the Fronts and Roofs of Houses has given the highest satisfaction. Churches, Chapels, Schools, Entrance Halls, Public Buildings, &c., heated with Hot-Water Apparatus in a most economical and efficient manner. J. T. & Son have great pleasure in referring to numbers of the nobility and gentry by whom they are extensively engaged.

BY HER MAJESTY'S ROYAL LETTERS PATENT.

E. DENCH, PATENT HOTHOUSE WORKS, King's Road, Chelsea.

These Patent Horticultural Buildings are superior to all others, wood being used for the frame work, but covered with Galvanised Iron Sashes, and all completed for 1s. 3d. per foot super. Hundreds of references can be given, and Printed Price Lists sent.

HOTHOUSES, CONSERVATORIES, FRAMES & LIGHTS FOR PITS, CUCUMBER & MELON BOXES & LIGHTS.

JAMES WATTS, HOTHOUSE BUILDER, 8, Claremont Place, Old Kent Road, London.

Green and Hothouses, 9, 10, 11, 12, 13, and 14 feet wide, any length, from 16 to 100 feet. Frames and Lights for Pits, 6 ft. 6 in., 7 ft., 7 ft. 6 in., 8 ft., and 8 ft. 6 in. wide, any length, from 12 to 100 feet. Upwards of 200 Cucumber and Melon Boxes and Lights, from 4 ft. by 3 to 10 ft. 6 in. by 5 ft. 6 in., kept ready, glazed with stout sheet glass, painted four times, complete, ready for immediate use, all made of best material, packed and sent to all parts of the kingdom.—Reference may be had to the Nobility, Gentry, and the Trade, in most of the counties in England.

C. STEPHENSON, late STEPHENSON AND SONS, 61, Gracechurch Street, London, Manufacturer of Iron Hurdles, Fencing, &c., Improved Iron and Copper Conical Boilers and Apparatus for Warming Buildings of every description, by Hot Water.—Prices and Estimates furnished upon application.

HORTICULTURE IN ALL ITS BRANCHES.

JOHN WEEKS & Co., King's Road, Chelsea,

HOTHOUSE BUILDERS.

THE NOBILITY AND GENTRY about to erect Horticultural Buildings, or fix Hot-water Apparatus, will find at our Horticultural Establishment and Hothouse Works, King's Road, Chelsea, an extensive variety of Hothouses, Greenhouses, Conservatories, Pits, &c., erected, and in full operation, combining all modern improvements, so that a lady or gentleman can select the description of House best adapted for every required purpose.

The HOT-WATER APPARATUS, which passes through all the Houses and Pits affording both top and bottom heat, is in constant operation and particularly worthy of attention.

Many of the Houses and Pits are of wide and lofty dimensions, and together equal in length 1000 feet. They are all effectually heated by *one boiler*, which, during the severe winter months does not cost in labour and fuel more than 3s. 3d. per day, and the apparatus is so arranged that each House or Pit may be heated separately and to the required temperature. The splendid collections of Stove and Greenhouse Plants are also in the highest state of cultivation, and for sale at very low prices. Also a fine collection of strong Grape Vines in pots, from eyes, all the best sorts.

Plans, Models, and Estimates of Horticultural Buildings; also Catalogues of Plants, Vines, Seeds, &c., forwarded on application to JOHN WEEKS & Co., King's Road, Chelsea, London.

HEATING BY HOT WATER.

JOHN WEEKS & Co., King's Road, Chelsea, Horticultural Builders and Hot Water Apparatus Manufacturers. At our two Establishments horticultural science is fully carried out in all its branches.

The accompanying sketch represents our Improved Boiler. These Boilers are very powerful, durable, and economical. The whole of our extensive nursery establishment is heated by *one boiler*, measuring only 5 ft. by 3 ft. 6 in. The Houses heated consist of forcing-houses of various descriptions, many of them are of wide and lofty dimensions, in length 1000 ft. and exposing to the atmosphere upwards of 16 000 superficial feet of glass. During the late severe winter it only cost us 3s. per day for fuel, and we had more than a sufficient command of heat. Any number of forcing-houses can be heated by *one of our Boilers*, and any part regulated at pleasure. Plans, Models, and Estimates of Horticultural Buildings, or Heating by Hot Water, forwarded on application.

JOHN WEEKS & Co., King's Road, Chelsea, London.

HOW TO KILL RATS, MICE, AND MOLES BY HUNDREDS.—A method will be forwarded with instructions for 30 postage stamps, which will destroy the above vermin quickly and without trouble. 1000 Acres may be cleared for a few shillings.—Gilbert Dyson, Hoo, Rochester.

WARNER'S SWING WATER-BARROW
(TO HOLD THIRTY GALLONS)

Is intended for all large Establishments where much watering is done by the watering-pot. By its use much time and labour of the Gardener are saved, particularly where the Tank, Pond, or Pump, is at a distance from the garden. May be obtained of any Ironmonger in town or country for 3*l.* 3*s.*

Manufactured by
John Warner & Sons, 8, Crescent, Jewin Street, London.

JOHN WARNER AND SONS,
Crescent, Jewin Street, London.
GALVANISED IRON TUB GARDEN ENGINE,
With Warner's Registered Spreader,

is strongly recommended, for durability and low price, viz., 2*l.* 19*s.*, to hold 10 gallons.

Larger sizes in wood or iron, viz., 14 gals., 24 gals., & 35 gals. May be obtained of any Ironmonger or Plumber in town or country, or of the Patentees and Manufacturers, as also Machinery of all kinds for raising Water from any depth to any height by Steam, Horse, or Manual Power. Prices sent on application. Syringes of various constructions and sizes from 9*s.* upwards. Metallic String from 5*d.* to 1*s.* 3*d.* per lb.

TO AGRICULTURISTS AND OTHERS.

SIMPSON and BARNES, Openshaw, near Manchester, beg to call the attention of parties requiring power to their PORTABLE and STATIONARY STEAM-ENGINES, from one-horse power and upwards, having the boiler and engine attached. They require no foundation, are simple and cheap, and are sent from the works ready to start when they arrive at their destination.

TO NURSERYMEN, FLORISTS, AND OTHERS.

TO BE SOLD, the LEASE of GROUND, near town, with Greenhouses, Pits, &c., well stocked with Plants. Rent 10*l.* per annum.—Apply to Mrs. Preston, Florist, Kilburn; or to Mr. Goddard, 14, Great Portland Street, Cavendish Square.

CANNES, SOUTH OF FRANCE, ON THE SHORES OF THE MEDITERRANEAN.

TO BE SOLD, the CHATEAU St. GEORGES, at Cannes, one of the most delightful marine residences in Europe, with its elegant and appropriate furniture, all in perfect order, and fit for the immediate reception of any nobleman's or gentleman's family. The chateau is in the Palladian style of architecture, fitted up with every English comfort, and in a beautifully warm and dry climate, where sea-bathing may be continued all the year with the greatest convenience. The gardens on the south side of the chateau slope down to the sea, with doors opening on to the beach. On the north side the property is bounded by the grand route from Paris to Nice, from which latter town it is distant about 20 miles south-west. The chateau is only a few minutes from the seat of Lord Brougham, and about one mile west from the town of Cannes, from which port there are steamboats weekly to and from Marseilles, and four diligences to and fro daily between Paris, Marseilles, and Nice. The chateau is on an elevated terrace, rising up from the orange garden, and within 200 yards of the seashore. It was originally built by the late Lieutenant-General Sir Herbert Taylor, but has since received considerable additions and embellishments. The terrace floor, occupying the south front, consists of splendid double drawing-rooms, library, dining and breakfast rooms, all *en suite*, and opening on to a Doric colonnade of hewn stone, and descending by steps to a beautiful gravelled terrace, 250 feet long, facing the "blue Mediterranean." From the drawing-room floor a splendid marble staircase leads to a first and second floor of elegant bedrooms, of which there are on the two floors nine to the south front, two to the east, and six to the north, besides six servants' rooms in the attics. Excellent porter's lodge at the entrance, poultry houses, six-stalled stables, large coach-houses, and splendid flower and kitchen gardens, and a great variety of shady and ornamental walks amongst the natural woods of Cork trees, Fir, Myrtle, Arbutus, and maritime stone Pines; and amongst the gigantic rocks are growing the Cactus, flowering Aloe, and other tropical plants in their natural state, the great variety of level and cultivation giving the idea of a much larger extent of ground. The whole is enclosed with walls, but not obstructing the fine view of the magnificent scenery around, and forms a parallelogram containing about 30,200 square yards, or about 7 English acres. The remarkable salubrity of the climate of Cannes, where winter is unknown, and the magnificence of the coast and finely wooded mountain scenery around, render it one of the most delightful places in Europe for invalids; and its easy approach from England by the opening of the Mediterranean Railway direct to Marseilles, places a climate superior to Naples within 48 to 50 hours of London, viz., 13 hours London to Paris, and 20 hours thence to Marseilles, from whence to Cannes is 11 hours per steamboat, or posting 14 hours, or per diligence 17 to 18. The electric telegraph is laid along the grand route, past the lodge gates on the north side of the property. The new English church will be opened (D.V.) in the course of next month.

For further particulars, apply to Messrs. Green, Estate Agents and Auctioneers, 28, Old Bond Street, London.

FLORIST'S BUSINESS.

TO BE SOLD, the NURSERY GROUND, GREENHOUSES, &c., of the late Mr Henry Groom, at Clapham Rise, Surrey, in consequence of his death, and the GOODWILL of the well-established BUSINESS to be disposed of. The Premises (exclusive of a strip of land held rent free, subject to six months' notice) comprise 3¼ acres, and are held at the low yearly rent of 80*l.* for an unexpired term of 36 years from Michaelmas, 1855. The House adjoining, late in the occupation of Mr. Groom, is not comprised in the lease, but may be rented. The Premises may be viewed on application, and further information obtained of Messrs. Protheroe & Morris, American Nursery, Leytonstone, Essex; and of Messrs. Barnes & Bernard, Solicitors, 2, Great Winchester Street, London.

TO BE LET, A NURSERY AND SEED BUSINESS—John Young begs to say that he is desirous of treating with a Tenant for his Nursery Ground, which he is at present occupying himself, and which offers an eligible opportunity to any one wishing to enter on the business. The stock is light, and the quantity of land may be made to suit the convenience of the Tenant.—For further particulars apply to John Young, Elm Cottage, Taunton.

TO BE LET, CHEVINGTON WOODSIDE FARM, in the parish of Warkworth, Northumberland; tithe free, and entered to at May-day, 1856, containing about 566 acres, of which 90 acres are in old Grass. The tillage land is of sound good quality, and the old Grass is very valuable fattening pasture. A large portion of the farm has been thorough drained under Government grant. The Farm is within two miles of the Addington Station. Mr. Thos. Brown, of Whitefield House, near Acklington, will show the farm with a plan.—Further particulars may be had by application to George A. Grey, Esq., Millfield, Northumberland, by whom offers will be received till 12th Nov.

CARDIGANSHIRE.

TO BE LET, and entered upon immediately, a highly improvable FARM of about 280 acres of Arable, Meadow, and Pasture Land, with an excellent newly-built Dwelling House fit for the occupation of a family of respectability. The Estate is called Wstrws, and situate at Capel Cynon, about seven miles from Newcastle Emlyn and the same distance from the thriving port of New Quay. It is well watered, having a brook running through it, and slopes for the most part towards the south. In addition to an excellent Dwelling House just about finished, there is a Cottage and Garden (let at 3*l.* 10*s.* a-year), and the fair tolls of Capel Cynon Fair, held twice a year, are received by the tenant, worth from 5*l.* to 10*l.* annually. The property offers great advantages to an experimental farmer with capital and application. Rent, in its present state, 100*l.* per annum; the proprietor would make further permanent improvements to suit a tenant on having a moderate return for the outlay. The Dwelling House contains on the ground floor two excellent Sitting Rooms 18 feet by 14 each, Study, Kitchen, and Offices, with Six Bedrooms over, and all conveniences for a respectable family. A long lease would be granted to an approved tenant, and more land might be obtained on moderate terms, with the right to shoot over about 800 acres. The neighbourhood is good, the Tivy side and Bwnwydd hounds meet in the neighbourhood very frequently. It is expected that the estate will be greatly increased in value on the extension of the railway from Carmarthen to Llandysil and Cardigan, for which an act has been obtained. The present lessee John Price Hilton, Esq., Glanyrafon, near Llandysil, Cardiganshire, will show the property on an appointment being made with him; and for further particulars apply to Thomas Davies, Esq., Solicitor, Cardigan; or Messrs. Henderson, Howard, and Wilcocks, Solicitors, 50, Broad Street, Bristol.

Sales by Auction.

DUTCH BULBS, STANDARD AND OTHER ROSES, ETC.

MR. HASLAM will Sell as above, at the Auction Mart, London, on THURSDAY and FRIDAY next, Oct. 11 and 12.—Catalogues to be had at the Mart.

ORCHIDS—AN IMPORTATION FROM THE BRAZILS.

MR. J. C. STEVENS will Sell by Auction, at his Great Room, 38, King Street, Covent Garden, on TUESDAY, 16th inst., an Importation of fine Plants in excellent condition of Lilia purpurata, Cattleya lobata, Leopoldi, Mossiæ, crispa superba, granulosa, violacea, &c., and an unknown species of Galeandra.—May be viewed on the morning of sale, and Catalogues had.

STOVE AND GREENHOUSE PLANTS.

MR. J. C. STEVENS will sell by Auction, at his Great Room, 38, King Street, Covent Garden, on TUESDAY, Oct. 9th, at 1 o'clock precisely, a Collection of STOVE and GREENHOUSE PLANTS, including many fine specimens and some choice Camellias and Azaleas, well set with bloom, and a few Orchids.—May be viewed on the day prior, and catalogues had of Mr J. C. Stevens, 38, King Street, Covent Garden.

TO GENTLEMEN, NURSERYMEN, AND OTHERS.
Rose Cottage Nursery, Retford, Wilts.

MESSRS. F. WHITE and SON will sell by Auction, on TUESDAY, 9th October, on the above premises, in consequence of the ground having been sold, F. Pennington's stock of early prolific RHUBARB ROOTS, the same with which he has supplied the Manchester and Sheffield markets in the early part of the season for several years, comprising 10,000 strong healthy roots of Linnæus, together with a Nursery Stock, consisting of Forest, Fruit, Ornamental, Evergreen, and Deciduous Shrubs, with a quantity of Quick Privet, &c.; one 32 Light Pit.

CHOICE TULIPS.

MR. ALEXANDER has been instructed by Mr. Willison, of the Rose Nursery, Whitby, to offer for sale by Auction, at the Mart near the Bank of England, on WEDNESDAY, Oct. 24, at 12 o'clock, his unrivalled SEEDLING TULIPS, comprising feathered breaks of the following first-rate varieties, viz., Gem, Juliet, Eva, Queen, King, Mr. J. F. Wood, Mr. Sanderson, Sir J. Paxton, Exquisite, (Purity, and Yellow Model Selfs). Any comment upon these unrivalled flowers would be superfluous.—Catalogues may be had at the Mart, and also of Messrs. Dawe, Cottrell, & Benham, Seedsmen, Moorgate Street; White Swan, West Ham; Mulberry Tree, Bromley; Mr. Willison, as above, and of the Auctioneer, Shacklewell and Leyton, who will execute any commissions for country growers.

MR. HUMBERT will Sell by Auction the following STOCK, on FRIDAY, October 19th, at 12 for 1 o'clock, at Harwood's Farm, Watford, Herts, by direction of the Earl of Essex, 375 pure South Down Ewes and Tegs, being the whole of the celebrated flock of the Earl of Essex, also 50 Fat and Store Pigs of the best breeds, 26 Ayrshire and Short-horn Heifers and Steers, 10 Calves, 4 black Ponies, under 12 hands, which have been driven together, and 100 loads of prime Hay; also the well-known Flock reared by his lordship with so much solicitude during the past 10 years, and now disposed of solely because he intends to adopt another system of farming.—May be viewed by applying to Mr. Swanston, at Harwood's Farm, of whom Catalogues may be had; also at the Salisbury Arms, Hertford; the Peahen, St. Alban's; Red Lion, Barnet; King's Arms, Hemel Hempstead; King's Arms, Berkhamps'ead; George Inn, Bishop Stortford; Chandos Arms, Edgware; White Horse Inn, Uxbridge; and free by post of Mr. Humbert, Land Agent and Surveyor, Watford.

GRANGE ROAD, BERMONDSEY.
To Noblemen, Gentlemen, and Pine Growers.

MR. W. T. ATTWOOD will Sell by Auction, on the premises, without the least reserve, the extensive stock of healthy PINE PLANTS, principally Queens, together with the various Ranges of Graperies and Forcing Pits, also the whole of Hot-Water Apparatus, comprising about 1590 feet of pipe and three large Boilers. The above property is in good condition, and offers a valuable opportunity to persons requiring Pine Plants and Forcing Houses. The sale will take place about the end of October.

NURSERY STOCK.
To Noblemen, Gentlemen, Contractors, and Others.

MESSRS. PROTHEROE and MORRIS will Sell by Auction, on the Premises, Albion Road, Stoke Newington, on MONDAY, October 22d, and following day, at 11 o'clock each day, fine Ornamental Trees, Evergreens, and Shrubs, consisting of Aucubas, Hollies, Box, Laurels, Arborvitæ, Limes, Poplars, Lilacs, Weeping Ash, Purple Beech, Scarlet Chesnuts, Evergreen Privets; Rhododendrons, Azaleas, and other American Plants; choice Fruit Trees, including Apples, Pears, Plums, Cherries, Peaches, Apricots, Grape Vines, &c.; Standard Dwarf and Climbing Roses, and a large assortment of Hardy Climbers in Pots; choice Cinerarias, Chrysanthemums, &c.—Catalogues may be had on the Premises, of the principal Seedsmen, and of the Auctioneers, American Nursery, Leytonstone, Essex.

FULHAM.
Lockhart's Annual Sale of Bulbs and Flower Roots.
TO NOBLEMEN, GENTLEMEN, NURSERYMEN, AND OTHERS.

MESSRS. PROTHEROE and MORRIS will Sell by Auction, on the premises, Parson's Green Lane, Fulham, on MONDAY, October 15th, at 11 o'clock, without reserve, a costly and extensive collection of BULBS and FLOWER ROOTS, being about 50,000 in number, and consisting of all the approved Hardy and Ornamental varieties of Hyacinths, Early and Late Tulips, Crocus, Narcissus, Anemones, &c., in good condition; also 4000 Sir Charles Napier Ranunculus, the finest variety yet raised; with a collection of Herbaceous Plants, and sundries.—May be viewed three days prior to the sale; Catalogues had, 6*d.* each, returnable to purchasers, of the principal Seedmen in London, and of the Auctioneers, American Nursery, Leytonstone, Essex.

CLAPHAM RISE.
To Noblemen, Gentlemen, Florists, and Others.

MESSRS. PROTHEROE and MORRIS will Sell by Auction, on the Premises, Clapham Rise, near London, on MONDAY, October 29, and following days, at 11 o'clock each day (by order of the executors of the late Mr. Henry Groom), the whole of the extensive, costly, and unrivalled collection of TULIPS, Offsets, and Breeders, which include the most rare and approved varieties in cultivation, and choice Seedlings not in the possession of any other grower, being the study of 40 years of the deceased's life, whose judgment and taste was universally admitted. Also Dutch and other Bulbs, consisting of the finest Double and Single Hyacinths, Narcissus Crocus, Jonquils, Gladiolus, &c., with a rich assortment of Ranunculuses, Anemones, &c. May be viewed prior to the sale.—Catalogues may be obtained 1*s.* each, returnable to purchasers, of the principal Seedsmen in London; and of the Auctioneers, American Nursery, Leytonstone, Essex.

HACKNEY.
To Gentlemen, Nurserymen, and Others.

MESSRS. PROTHEROE and MORRIS are directed by Messrs. Brown and Taylor to Sell by Auction, without reserve, on the premises, Hackney Nursery, Dalston Lane, Middlesex, on THURSDAY, the 11th of October, and following day, at 11 o'clock each day precisely (in consequence of the number of lots), the whole of the NURSERY STOCK; comprising Ornamental, Fruit, and Forest Trees, Evergreens and Deciduous Shrubs: also the Greenhouse Plants consisting of large specimen Camellias, Azalea indica, well set with bloom buds, Acacias, Cytissus, Myrtles, Deutzia gracilis, Forsythias, &c.; together with two Greenhouses, Pits, two and three Light Boxes, a quantity of Hot-Water Pipe Boilers, Wheelbarrows, 200 feet Stove Shelvings, capital Nest Seed Drawers, Counter, Garden Tools, and sundry effects.—May be viewed prior to the sale; Catalogues may be had on the premises; of the principal Seedsmen in London; and of the Auctioneers, American Nursery, Leytonstone, Essex.

CLARENDON NURSERIES, CAMBERWELL.

MESSRS. PROTHEROE and MORRIS are instructed by Mr. Joseph Fryer to submit to public competition on the above premises, on the 8th, 9th, and 10th days of October, at 11 o'clock each day, a portion of his extensive Nursery Stock, consisting of fine Standard and Dwarf Trained and Untrained Apple, Pear, Plum, Cherry, Peach, Nectarine, Apricot, Fig, Raspberry, Gooseberry, Currant, &c.; 2000 Mulberries, the finest stock in the trade, 4 to 10 ft.; 3000 Limes, 6 to 10 ft.; 4000 Lilacs of all sorts, 3 to 10 ft.; 2000 Evergreen Oaks, 2 to 5 ft.; 4000 Evergreen Privet, 3 to 6 ft.; also large quantities of Scarlet, White, and other Rhododendrons, Azaleas, Andromedas, Magnolias, and other varieties of American Plants; Garryas, Glycines, Clematis, Passion Flowers, Bignonias, Virginian Creepers, Ivies, Box, Laurels, Althæas, fine large Elms, Lombardy and Balsam Poplars, Acacias, Scarlet Thorns, fine strong Seakale, &c. &c.—May be viewed prior to the sale, and Catalogues may be had on the premises, of the principal Seedsmen, and of the Auctioneers, American Nursery, Leytonstone, Essex.

IMPORTANT STOCK SALE AT BARWAY, SOHAM, CAMBRIDGESHIRE.

MR. C. M. BIDWELL is instructed by Jno. Rayner Hovelly, Esq., who quits his occupation at Michaelmas, to Sell by Auction, on the premises, on WEDNESDAY, October 10, at 11 o'clock, without the least reserve, his carefully selected Herd of 40 improved SHORT-HORNS, comprising Cows, Heifers, Bulls, and Calves: valuable Flock of 400 SHEEP, viz., 290 half-bred Shearling Wethers, in good condition, 90 Two-shear Cheviot Wethers, and 18 prime Lambs; 10 excellent working CART-HORSES, 3 FOALS, and 5 NAGS. Also, all the valuable AGRICULTURAL IMPLEMENTS, consisting of a very complete portable Steam-engine by Hornsby, with Threshing Apparatus, Machines for Grinding, Crushing, and Dressing, an excellent Reaping Machine, improved for heavy crops, Manure and Corn Drill, with patent steerage, Garrett's patent Horse-hoe, Crosskill's Broad-wheeled and other Carts, Market Cart, new Dog Cart for a Cob, Iron and Wood Rolls, Richmond's Steaming Apparatus, Corn's Chaff-cutting Machine, Biddell's patent Wrought-iron Scarifier, Phillip's Turnip Cutter, Bean Mill, Ransome's Iron and Butterworth's Fen Ploughs, Harrows, Horse Harness, Iron and Wood Hurdles, 4 Iron Stack Stands, Double-action Churn, Glass Milk Pans, and numerous other effects. Barway is Three Miles on the Cambridge side of Ely, and a Special Train will convey Passengers from the Ely Station immediately after the arrival of the 10h. 47m. a.m. train, and set them down opposite the Farm, returning at 6h. 3m. p.m.

The Auctioneer begs to call the particular attention of Agriculturists to this sale, as a rare opportunity for parties wanting good stock and first-rate implements. The Shorthorns are well bred, many of them with good pedigrees, and great attention has been paid to their milking properties. The Horses are young and excellent workers. The Farming Implements made with modern improvements, and in good order. Refreshments will be provided on the Farm during the Sale on the Norfolk plan.—Catalogues may be had at the Lion Hotel, Cambridge; White Hart Hotel, Newmarket; Crown, Soham; Angel, Peterborough, and C. M. Bidwell, Land Agent, Ely and Cambridge, who will forward some by post on application.

Circulars free by post.

A CLEAR COMPLEXION,

GODFREY'S EXTRACT OF ELDER FLOWERS is strongly recommended for softening, beautifying, and preserving the skin, and giving it a blooming and charming appearance, being at once a fragrant Perfume and delightful Cosmetic. It completely removes tan, sun-burn, redness, &c., and by its balsamic and healing qualities renders the skin soft, and free from dryness, scurf, &c.; clears it from every humour, pimple, or eruption; and by continuing its use only a short time the skin becomes and continues soft and smooth, and the complexion clear and beautiful. In the process of shaving it is invaluable, as it annihilates every pimple and all roughness, and affords great comfort if applied to the face during cold easterly winds.—Sold in Bottles, price 2s. 9d., with directions for using it, by all Medicine Vendors and Perfumers.

ECONOMY OF FERMENTATION.

BUSHE'S PATENT ROOT GRATER, manufactured by FOWLER AND FRY, Temple Gate, Bristol, entirely supersedes the necessity of Cooking Turnips, Mangold, and other Roots; it effects a saving of 30 to 40 per cent. of the Roots, besides that of fuel. Price 3l. 10s. Printed testimonials and directions may be obtained gratis by applying to Fowler & Fry, Bristol. Licensed Makers of Corne's Patent Chaff Cutters and General Agricultural Implement Makers and Dealers. The Root Grater may also be seen in the Agricultural Department of the Crystal Palace, Sydenham.

BY ROYAL LETTERS PATENT.

With every other kind of Flower roots equally moderate in price. Descriptive and priced Catalogues forwarded on application.

Wm. Denyer, Seedsman and Florist, 82, Gracechurch Street.

DUTCH FLOWER ROOTS.

PETER LAWSON AND SON, Seedsmen and Nurserymen to Her Majesty the Queen, and to the Highland and Agricultural Society of Scotland, respectfully intimate that they are now ready to execute orders for HYACINTH ROOTS, &c., &c., of the finest kinds and in excellent condition. Catalogues may be had, free, on application.

27, Great George Street, Westminster.—Oct. 13.

IMPORTED DUTCH BULBS.

EVAN PAUL begs to inform his patrons and friends that he has received his first importation of the above, which have arrived in first-rate condition, early orders for which are respectfully solicited. Catalogues forwarded postage free on application.—The Nurseries, Derby, Oct. 13.

DUTCH BULBOUS ROOTS.

MARTIN AND SON have much pleasure in informing their friends that they have received in good condition their annual importation of the above, which are particularly fine, and trust to be favoured with early orders.—Catalogues may be had and also of their Nursery Stock for two stamps.—Nursery and Seed Establishment, Cottingham (1788); Hull Branch, Junction Street.

IMPORTED DUTCH FLOWER ROOTS.

T. F. WINSTANLEY, Seedsman and Florist, begs to inform his patrons and friends that he has received direct, from one of the first growers in Holland, his first annual importation of the above, comprising Hyacinths, Narcissus, Early and Late Tulips, Jonquils, Iris, Crocus, Gladiolus, Anemones, Ranunculus, &c. &c. All are unusually fine and well ripened. Descriptive Priced Catalogues can be had on application.—28, Market Place, Manchester.

NEW ROSES.

M. DUCHER, Rue du Vivier Guillotiere, Lyons, France, offers the following NEW ROSES:—

MARSHAL PELISSIER—Hybrid Perpetual, very strong growth; flowers very large and very highly perfumed; petals bright red on the edge, and very pale beneath. This plant deserves a place in the best collections.

GENERAL SIMPSON—Hybrid Perpetual, very strong growth, and flowers abundantly; flowers medium size, very full and well-shaped; bright red carmine—superb plant.

MARCHIONESS OF MURAT—Strong growth, flowers large, full, and very well-shaped; very beautiful blush and very agreeable perfume. Somewhat resembles Duchess of Sutherland.

Each Plant 15 francs, or 12*s.*; to be delivered on the 1st November next.

EARLY FLOWERS.

ADAPTED FOR BLOOMING IN-DOORS, AND IN THE BORDERS IN WINTER AND EARLY SPRING.

CLARKE AND CO., SEEDSMEN and FLORISTS, 86, High Street, Borough, about 30 doors from London Bridge Railway Terminus, beg respectfully to intimate to the nobility, gentry, and the public that they have imported a Stock of DUTCH and other FLOWER BULBS, of the finest possible quality, and take the liberty of offering the following assortment for 10*s.*, viz.:—Half a dozen best Hyacinths for glasses, half a dozen good Hyacinths for pots, 50 Crocuses (four separate colours), 50 large double Snowdrops, half a dozen double Van Thol Tulips, half a dozen early Van Thol Tulips, one dozen double white Sweet-scented Narcissus, half a dozen double Jonquils, one dozen winter Aconites, 12 splendid mixed Tulips, one dozen beautiful mixed double Anemones.

BASS AND BROWN'S
NEW AUTUMN CATALOGUES,

Comprising a considerable portion of descriptive and useful information, will be sent free by post complete for three penny stamps, and will be supplied gratis to our customers as usual. The articles will be found very select, and the best in cultivation.

NO. I. CATALOGUE CONTAINS:

BULBS & FLOWER ROOTS, comprising collections of the finest and most interesting bulbs in cultivation. The greenhouse varieties are distinguished from the hardy, and the colours and months of flowering are specified. A scale is also appended, giving the months best suited for planting.

HARDY HERBACEOUS PLANTS, with descriptions of heights, colours, and months of flowering, and embracing also our superb collections of Potentillas, Phlox, Penstemons, &c.

HOLLYHOCKS, the finest sorts, with full descriptions.

HELIANTHEMUMS, or Dwarf Rock Cistus, in 24 beautiful varieties.

SELECT and POPULAR TREES and SHRUBS, containing choice Collections of Coniferæ, Sikkim, and other Rhododendrons.

HARDY ORNAMENTAL CLIMBERS.

SELECT ROSES, with descriptions, and instructions for culture of each class.

FRUITS of the choicest sorts with select lists of each kind.

RHUBARB, Seakale, Asparagus, &c.

NO. II. CATALOGUE CONTAINS:

GERANIUMS, in divisions of Show, Fancy, French, Horseshoe Leaf, Scarlet, and other bedding varieties.

CINERARIAS, choicest varieties.

FUCHSIAS, best new of 1854.

AZALEA INDICA, including several beautiful new Continental and other varieties.

STOVE and GREENHOUSE PLANTS, &c. &c.

NEW SHOW GERANIUMS OF LAST SEASON.

For varieties of previous years see Catalogue. Fine selections, 9*s.* to 18*s.* per dozen. Purchaser's selections, 12*s.* to 21*s.* per doz.

IMPORTED DUTCH HYACINTHS.

Our Dutch Roots have arrived in very fine condition. We beg to offer the following, of our own selection, in fine assortments, with printed instructions for their culture:—

50 Hyacinths in 50 choice sorts	30*s.*	Choice varieties, per dozen	6*s.*, 9*s.* & 15*s.*
25 ditto 25 ditto	16*s.*	Separate colours without name, per dozen	3*s.*

If required for Forcing we particularly recommend early planting. For our extensive Collection of Bulbs see Catalogue.

☞ *Goods Carriage Free (not under 20s.) to all the London Termini and free to all stations on the London and Norwich Line, viâ Colchester. Extra Plants gratis with orders of 40s. and upwards.*

BASS & BROWN, Seed & Horticultural Establishment, Sudbury, Suffolk.

HYACINTHS.

MESSRS. E. G. HENDERSON & SON

BEG to announce that they have now received their noted collection of HYACINTHS in excellent condition. They also beg to state, that having been for nearly 50 years the largest and most successful cultivators of this highly popular Flower in the vicinity of London, they can with confidence recommend the varieties named in their Catalogue as being the most suitable for pot or glass culture, and every way worthy the attention of Amateurs, &c.

Catalogues can be had on application, and for the assistance of those persons unacquainted with the culture of the Hyacinth, printed instructions will be given gratis with each order they are kindly favoured with.

CUCUMBER—HENDERSON'S "NAPOLEON III."

E. G. H. & Son have great pleasure in informing those who are fond of a really good Cucumber that they have succeeded in obtaining the stock of the above variety. It is one of the best for Winter culture and early forcing; is a free bearer and perfect in its form, possessing, indeed, all those qualifications of a good Cucumber which the most fastidious could desire. In packets, containing two seeds, 3*s.* each; ditto ditto, four seeds, 5*s.* 6*d.* each.

FLOWER SEEDS FOR AUTUMNAL SOWING.

Collections containing 12 distinct varieties, with printed instructions, 3*s.* 6*d.* each, postage free; ditto, 24, 6*s.*; 36, 8*s.* 6*d.*; 48, 10*s.* 6*d.*

CALCEOLARIA, CINERARIA, AND PRIMULA,

Saved from the choicest varieties, may be had in packets at 2*s.* 6*d.* and 5*s.* each; the finest quality of Calceolaria is only offered at 5*s.*; second quality, 2*s.* 6*d.* The finest fimbriated Primula in the country, 2*s.* 6*d.*

NEW PLANTS.

In the possession of E. G. Henderson & Son, and will be sent out for the first time in October. Full Descriptions of the following may be seen in the New Autumn Catalogue, just published.

DUKE OF CAMBRIDGE (Henderson's)
GIOVANNA (Henderson's)
LA STELLA (Henderson's)
MOONLIGHT (Henderson's)
REINE DU BAL (Henderson's)
ROSY-LIP (Henderson's)
QUEEN OF THE FETE (Henderson's)
SWEET LUCY (Henderson's)
TITANIA (Henderson's)

CINERARIAS.

ADMIRAL LYONS (Henderson's).—Large full-sized flower, white, with purplish violet edging, dark dice, fine form. 10*s.* 6*d.*

FUCHSIAS.

BANKS' FAVORITE. 10*s.* 6*d.* | PRINCE OF WALES. 10*s.* 6*d.*

RHODODENDRONS.

The following magnificent new species, collected from the Bhotan Mountains, by Thomas J. Booth, Esq., are now, for the first time, offered for sale.

Boothi, | Hookeri, | Calophyllum, | Kendricki, | Eximium, | Windsori Leucanthum.

For full descriptions, with prices of the above splendid varieties, see Spring Catalogue, page 85.

GYNERIUM ARGENTEUM (The Pampas Grass).

E. G. H. and Son having in their possession the largest stock in the country of this noble ornamental Grass, will supply healthy plants in October at 2*s.* 6*d.* each or 25*s.* per dozen.

N.B.—Price to the Trade per 50 or 100 can be obtained on application.

GLOXINIA ERECTA.

Messrs. E. G. Henderson & Son have great pleasure in announcing that they have a very large stock of this new class, and most showy upright flowering Gloxinias. They are the most abundant flowerers, containing among them some of the most lively contrasts of colours imaginable. The Collection includes the new varieties sent out this season. Price 5*s.* and 7*s.* 6*d.* each, or 42*s.* and 60*s.* per dozen.

The following can be supplied in fine plants for flowering next season:—

CAMELLIAS AND ORANGES, at 30*s.* and 42*s.* per dozen. | AZALEAS, ERICA, EPACRIS, and APHELEXIS, at 12*s.*, 18*s.* to 42*s.* per dozen.

N.B. Price to the Trade per 100 or 1000 can be had on application.

☞ *The Spring Catalogue or General List of Plants will be forwarded post free on application; and a beautiful Coloured Plate of* NINE NEW FLOWERS *will be sent on receipt of* 12 *postage stamps.*

Wellington Nursery, St. John's Wood.

SPLENDID HYACINTHS, ETC. (IMPORTED).

JAMES CHARTRES AND CO. can strongly recommend their 20*s.* Collections of the above, which have always given such general satisfaction. 12 splendid named Hyacinths for pots or glasses; 12 do. do for Borders; 6 Polyanthus Narcis.; 12 Pheasant-eyed do.; 6 splendid Early Tulips for pots; 12 do. Late do. for Borders; 100 Crocus, sorts; 12 fine Iris; 6 Snowflakes; 6 Double Jonquils; 25 Double Snowdrops. A general and priced Catalogue on application.—Seed Warehouse, 74, King William Street, City, London.

THE PAMPAS GRASS, "Gynerium Argenteum."

LUCOMBE, PINCE, AND Co. having now for sale the finest stock of flowering plants in this country of the above, are enabled to offer their well established plants to bloom this autumn at the following prices:—

Fine specimens with two flower stems ...	21*s.* 0*d.* each.
Ditto with one ditto	10*s.* 6*d.* "
Smaller plants to bloom next year	7*s.* 6*d.* "

L., P., & Co. have also healthy seedlings at 30*s.* per dozen, which will be ready in October, which, however, they deem it right to say will most probably not bloom for two years. To such parties as wish at once to see the plant in its beauty, L., P., & Co. would strongly recommend the larger sizes, as they are much better and cheaper.

Few plants are more ornamental than this Gigantic Grass, the leaves (which are more than 7 feet in length, curving gracefully outwards) grow in large tussocks, thereby producing a very fine effect, and from the midst of these numerous flower stems arise to the height of from 6 to 8 feet, surmounted by elegant panicles of inflorescence nearly 3 feet long, resembling beautiful waving plumes of silvery feathers. It is perfectly hardy, and is also easy of cultivation. A grand specimen of this noble plant is now in the Exeter Nursery, pushing up nearly twenty large flower stems and numerous small ones, and will continue to be an object of great attraction for a considerable time.

EXETER NURSERY, EXETER.
Established 1720.

MAGNIFICENT SPECIMENS OF CONIFERÆ.

LUCOMBE, PINCE, AND CO. respectfully call attention to their very superior specimens of the above, which are worthy of the notice of all who are engaged in ornamental planting, their growth and shape being perfect, and their roots all that can be desired, so that where immediate striking effect, combined with perfect safety of removal to any distance is required, these large symmetrically grown and well managed plants can with confidence be recommended.

VINES FOR FRUITING IN POTS.

MESSRS. J. AND J. FRASER, NURSERYMEN, Lea Bridge Road, Essex, beg to announce that they have a very choice selection of the best sorts of VINES from eyes grown in 12 and 15-inch pots, Price 5*s.* and 7*s.* 6*d* each.

N.B. Strong Vines for planting out, 3*s.* 6*d.* each.—Oct. 13.

FRUIT TREES IN POTS.

HLANE AND SON have the pleasure of announcing that their very extensive collection of FRUITS IN POTS are now ready for sending out, well set with bloom-buds, consisting of Peaches, Nectarines, Apricots, Cherries, Plums, Pears, Apples, &c., and are quite worthy the attention of those who take a delight in this particular branch of horticulture.

The Nurseries, Great Berkhamstead, Herts.

CHOICE CALCEOLARIA SEED.

LUCOMBE, PINCE, AND CO. have now ready for sending out Seeds of their very superior CALCEOLARIA, saved with great care from all the newest and choicest varieties, which if sowed now will flower finely next summer.

The great satisfaction which their Calceolarias have given for several successive years enables them to recommend their Seed of the present season with much confidence.

Packets sealed and warranted by them, at 2*s.* 6*d.*, free by post.

EXETER NURSERY, EXETER.
ESTABLISHED 1720.

GEORGE JACKMAN begs to state his PRICED CATALOGUE of choice CONIFERA, HARDY EVERGREENS and ORNAMENTAL TREES, which are well grown, and constantly removed; also Roses, Standard, Dwarf, and dwarf-trained Fruit Trees, and Forest Trees, can be had on application by enclosing one Postage Stamp.

G. J. respectfully invites persons planting to pay a visit to his extensive nursery, one and a half mile from Woking Station, South Western Railway, where all trains stop, and conveyances can be had.—Woking Nursery, Woking, Surrey.

TO PLANTERS.

JOHN SCOTT, of the Merriott Nurseries, Crewkerne, Somerset, has for Sale large and fine specimens of EVERGREENS, &c., at the lowest prices. The following are fine bushy plants, from 3 to 6 and 7 feet high, and from 6 to 16 feet in circumference:—Deodars, Cedars of Lebanon, Red Cedars, Arbor-vitæ, upright Cypress, Silver Fir, Evergreen Oak, Portugal Laurel, Arbutus, &c., in large numbers. Also all the leading Deciduous Trees from 6 to 16 feet high, all moved last May, and are now finely rooted; Forest Trees, many hundred thousands ready for planting; with fine Standard and Dwarf-trained Fruit Trees, of all the best and leading kinds, at very moderate prices. Gentlemen requiring large numbers will find the above well worthy of attention. Prices and signs sent to any application.—Oct. 13

CHARLES SCHOFIELD (late J. SCHOFIELD & SON), SEEDSMAN and FLORIST, begs to invite the attention of Florists to his large and superb Stock of CARNATIONS, PICOTEES, PANSIES, PINKS, HOLLYHOCKS, &c., which he now offers at greatly reduced prices of the best quality. A Catalogue, descriptive of the above Flowers, is now ready, and will be sent on application.

PANSY SEED, in Packets, selected with the greatest care, from the best Show Flowers, 2*s.* 6*d.* each.

Also a few Packets of Extra-fine CALCEOLARIA SEED, 2*s.* 6*d.* each.

The finest HOLLYHOCK SEED, 1*s.* per Packet.

Knowsthorpe, near Leeds, Yorkshire.

NEW STRAWBERRIES AT REDUCED PRICES,
GROWN AND OFFERED FOR SALE BY

WILLIAM J. NICHOLSON, Egglescliffe, near Yarm, Yorkshire.—The following splendid varieties have been well proved this season and given complete satisfaction, viz., Sir Harry (Underhill's), 100 plants, 4*l.*; 40, 1*l.* 18*s.*; and 20, 1*l.*; or 12*s.* 6*d.* per dozen. Omar Pacha (Ward's), 1*l.* per 100; 12*s.* per 50; 7*s.* per 25. Scarlet Nonpareil (Patterson's), 2*l.* per 100; 1*l.* per 50; 12*s.* per 25. Sir Charles Napier (Smith's), 1*l.* per 100; 12*s.* per 50; 7*s.* per 25. Admiral Dundas (Myatt's), 1*l.* per 100; 12*s.* per 50*s.*; 7*s.* per 25. Nicholson's Ajax, Ruby, Captain Cook and Fill-Basket, 6*s.* per 100; Ingram's Prince of Wales, Nimrod, Eliza (Rivers's), Surprise (Myatt's), and Bicton Pine, a large white one, 6*s.* per 100; British Queen, Black Prince, Eleanor (Myatt's), Old Pine, Trollope's Victoria. Goliah (Kitley's), Keens' Seedling, Old Roseberry, all at 4*s.* per 100; Crystal Palace, a very large and late variety, 10*s.* per 100. Post-office Orders payable at Yarm are expected with all orders. The plants will be securely packed and forwarded to any part of the kingdom.

Plants kept in frames for spring planting.

FRUIT TREES.

THOMAS RIVERS begs to submit to the Public the following synopsis of his Fruit Tree Culture, which is this season more than usually complete and extensive.

APPLES, on Crab Stocks.—Standards for orchards, dwarfs, and dwarfs trained for espaliers.

APPLES, on Paradise Stocks, for gardens.—Pyramids, dwarf bushes, dwarfs trained for espaliers, and dwarf bushes in pots.

APRICOTS.—Standards, standards trained, half standards in pots, dwarfs, dwarf bushes for potting, dwarfs trained for walls, and dwarfs in a fruiting state in pots for orchard houses.

CHERRIES, on black Cherry Stocks.—Standards, standards trained, dwarfs, and dwarfs trained.

CHERRIES, on the Mahaleb Stock.—Dwarf bushes for potting and culture as bushes, dwarfs trained for walls, and dwarf bushes in pots.

CURRANTS.—Dwarf bushes, including some new and fine [varieties.

FIGS, in pots, in a bearing state.

GOOSEBERRIES.—Small, high-flavoured, old sorts, and all the large new Lancashire varieties.

GRAPES for Vineries, from eyes, in pots.—Strong plants, two and three years old; ditto, in pots, dwarf bushes for orchard houses; ditto, hardy sorts from the open ground for walls.

MEDLARS.—Standards and dwarfs.

MULBERRIES.—Standards and dwarfs trained for walls.

NECTARINES AND PEACHES.—Standards, standards trained, half standards in pots, dwarfs, dwarfs trained, and dwarfs in a fruiting state in pots for orchard houses.

NUTS AND FILBERTS.—Dwarf bushes, and standards 4 feet high grafted on the Hazel Nut.

PEARS, on Pear Stocks.—Standards, standards trained, dwarfs, dwarfs trained for espaliers and walls; pyramids six years old, twice or thrice removed, in a bearing state; these are adapted for gravelly and chalky soils unfavourable to pyramids on the Quince Stock.

PEARS, on Quince Stocks.—Standards trained for walls, pyramids, pyramids root-pruned, in a bearing state; dwarf bushes in a bearing state, for potting, or for culture as bushes; dwarf bushes in pots, in a bearing state, for orchard houses.

PLUMS.—Standards, standards trained, dwarfs, dwarf bushes for potting or for garden culture, dwarfs trained for espaliers and walls, dwarf bushes in pots for orchard houses, and pyramidal trees in a bearing state.

QUINCES.—Standards of the common Quince, and pyramids of the large Portugal Quince.

RASPBERRIES.—Canes of the finest varieties.

STRAWBERRIES.—Runners of the finest varieties.

WALNUTS.—Standards and dwarfs for gardens of the Dwarf Prolific Walnut.

The descriptive Catalogue of Fruits, which is so arranged as to point out to those commencing Fruit Culture the most select varieties, will be ready for delivery in a few days.

Nurseries, Sawbridgeworth, Herts, Oct. 13.

RHODODENDRONS.

JOHN WATERER begs to announce that he is now prepared to execute orders for his two New Hardy Hybrid Rhododendrons, in good established plants, at 42*s.* each.

Rhododendron JOHN WATERER, colour glowing carmine, large truss, fine foliage, and a most abundant bloomer, in perfection about the 15th June.

Ditto, MRS. JOHN WATERER, a bright rosy crimson, fine conical truss, a very free blooming kind, in flower about 15th of June.

To the admirers of this justly noble class of Plants, JOHN WATERER has the pleasure of recommending the above as being the greatest acquisitions yet offered. They combine in a marked degree the necessary requisites for really first-rate hardy crimson varieties, viz., imposing colours, abundant bloomers, extreme hardiness, and flower at a time when they are not liable to be injured by spring frosts.

The American Nursery, Bagshot, Surrey, Oct. 13.

WATERER'S AMERICAN PLANTS.—A new DESCRIPTIVE CATALOGUE is now published of the celebrated Collection of hardy Scarlet and other Rhododendrons, as exhibited by JOHN WATERER at the Royal Botanic Gardens, Regent's Park; it will be found to contain a few practical observations on their successful management, and will be forwarded on application by enclosing two stamps for postage. Apart from its enumeration of the most popular American Plants in cultivation, a List of choice Coniferæ will be seen, embracing the latest importations of this fine and hardy tribe of Plants.

J. W. has now the pleasure to offer in large quantities, and of all heights, the following selection of CONIFERS, with the remark that they are all now growing in the open ground, are bushy and handsome as can be desired, and have been transplanted each succeeding spring, whereby no risk can be encountered in their removal from the nursery:—Araucaria imbricata, Cryptomeria japonica; Pinus Douglasi, Cembra, excelsa, Lambertiana, insignis, Jefferyana, Beardsleyi, tuberculata, &c.; Cedrus Deodara, Lebanon, and Africana; Wellingtonia gigantea, Cupressus, Juniperus, Taxus, Thuja, &c.

☞ The attention of gentlemen, public companies, and others engaged in planting, is especially directed to the foregoing; indeed, all intending planters would be well repaid by a visit to inspect our stock, as much may be seen which of necessity cannot be given within the limits of an advertisement.

The Nursery is easily reached by railway, being near the Farnborough Station, South-Western Railway, and Blackwater on t e South-Eastern Railway.

The American Nursery, Bagshot, Surrey.

RARE AND NEW FERNS.

R. KENNEDY having at present a good assortment of the more choice species of FERNS would especially recommend the following selection:—

Acrophorus hispida	Lomaria Magellanica
Cheilanthes Alabamaensis	Nephrolepis Davalliöides
" vestita	Nothochlæna nivea
Cassebeera farinosa	Platycerium grande
Gymnogramma lanata	Drynaria coronans
" pulchella	Trichomanes Andrewsi
" dealbata	Davallia tenuifolia
" chrysophylla	Woodsia hyperborea
" tomentosa	

Prices and General Catalogue forwarded on application.

Bedford Conservatory, Covent Garden, Oct. 13.

MYATT'S ADMIRAL DUNDAS STRAWBERRY.—Strong plants packed and delivered free in London, 25*s.* per 100. Also MYATT'S British Queen, Cinquefolia, Globe, Eliza, Mammoth, 3*s.* 6*d.* per 100; Keens' Seedling, Hooper's Seedling, Black Prince, Bicton Pine, 3*s.* 6*d.* per 100.

MYATT'S BRITISH QUEEN.—In reply to several correspondents, and in confirmation of the private answers I gave last summer, I beg leave to state that the only Strawberry bearing the name of "British Queen" is MYATT'S, and when Mr. Beach, in his advertisement says "his true British Queen," he is obviously in error, and arrogates to himself the credit due to my late father, Mr. JOSEPH MYATT, who was the originator of the variety in question.—W. MYATT, Manor Farm, Deptford.—Oct. 13.

CHARLES TURNER begs to offer the following NEW PLANTS, which will be sent out this autumn for the first time:—

NEW CARNATIONS.	Per pair—*s.*	*d.*
Omer Pacha (Puxley), scarlet bizarre, very fine	10	6
Silistria (Puxley), scarlet bizarre, large and fine	7	6

General Simpson (Puxley), crimson bizarre, very fine ...	7	6
Morgan May (Puxley), P. P. B., very fine	7	6
Sir Colin Campbell (Puxley), P. P. B....	5	0
Orion (Puxley), scarlet flake	5	0
Warrior (Puxley), crimson bizarre	5	0
Lord Cardigan (Puxley), crimson bizarre	5	0
NEW PICOTEES.		
Sultana (Turner), medium red edge, extra fine large smooth petal	10	6
Dr. Pitman (Turner), heavy red edge, pure white, with very solid red edge, without spot or bar, extra fine ...	10	6
Mrs. Drake (Turner), heavy scarlet edge, full size, large petal, and colour solid on the eye, extra fine. Figured in the "Florist," for September, 1855	10	6
Eugenia (Turner), light red edge, very large, an extra fine variety	10	6
Mrs. Lochner (Turner), heavy red edge, great substance, and very solid and bright, very fine	10	6
Mrs. Dodwell (Turner), very fine heavy red edge, with very large petal, rather thin, fine	7	6
Mrs. Pitman (Turner), heavy scarlet edge, very large, and a great improvement on Green's Queen	7	6
Mrs. Gair (Turner), light rose edge, large and fine ...	7	6
Mrs. Aitken (Turner), medium purple edge, full flower large and fine	7	6
Bessie (Turner), medium purple edge, extra fine	7	6
Chancellor (Headley), heavy red edge, fine	5	0
Lady Eleanor Cathcart (Turner), heavy scarlet edge, very bright, fine	5	0
NEW PINKS.		
Mrs. Stevens (Looker), purple edge, extra fine	5	0
Mrs. Norman (Norman), purple edge, very smooth. This very fine variety was raised by Dr. Norman, of Colchester, the raiser of Colchester Cardinal and other fine varieties, and has obtained first class certificates at the principal London exhibitions	5	0
Lady Grenville (Turner) red edge, fine petal, extra fine ...	5	0
Peter Young (Turner), red edge, large and very fine. Received a first class certificate at the National Floricultural Society	5	0
Great Criterion (Maclean), rosy purple edge, very large petal, smooth, too thin for southern growers, but suitable for northern growth	3	6
Star (Westbrook), red, very bright, and of fine quality, but rather small. Received a certificate at the Royal Botanic Society	3	6

NEW GERANIUMS AND NEW FANCY DITTO.

See Geranium Catalogue just published.

Royal Nursery, Slough.

GRAPE VINES FROM EYES IN POTS.

LUCOMBE, PINCE, AND CO. beg respectfully to call attention to their remarkably fine stock of Grape Vines, raised from eyes in pots, in a bearing state.

L., P., & Co. having two years ago erected a Vinery 90 feet long for the especial purpose of proving every good Vine in cultivation, are enabled to say that the Plants sent out by them are true to name.

LUCOMBE, PINCE, AND CO.,
EXETER NURSERY,
EXETER.
ESTABLISHED 1720

THE EXETER NURSERY, EXETER.

LUCOMBE, PINCE, AND Co. respectfully beg leave to inform the Public that their Nursery is this season abundantly furnished with a fine healthy Stock of all the best varieties of

HARDY ORNAMENTAL TREES AND SHRUBS,
HARDY EVERGREENS, CONIFERÆ,
FRUIT TREES, FOREST TREES,
RHODODENDRONS,
&c., &c., &c.

Their stock of every description of Nursery produce is so good as well as extensive that they are enabled to offer advantageous terms to Purchasers, for particulars of which apply as above.

THE BEST TWELVE HYACINTHS FOR POTS OR GLASSES.

(*Parcels if not less than 20s. value, carriage free.*)

The best 12 HYACINTHS imported (by name) ...		9*s.*	0*d.*
Double do. for open ground, mixed ...	per doz.	4	0
CROCUSES, many sorts mixed, ...	per 1000	12	6
TULIPS, fine mixed, early for pots or borders,	per 100	6	0
ANEMONES, fine double mixed	per 100	5	0

And all other BULBOUS FLOWER ROOTS at low prices, as per Catalogue just published.

JOHN SUTTON & SONS, Seed Growers, Reading, Berks.

SUTTON'S IMPROVED ITALIAN RYE GRASS.

SUTTON AND SONS, SEED GROWERS, Reading, are now harvesting their crop of Seed of this superior variety of Italian Rye Grass, and are also importing a supply of fresh Lombardy Seed. As the demand appears likely to be great, Messrs. SUTTON respectfully recommend their friends who intend to sow these articles next season, to favour them with their orders early, in case the stock should prove short.

N.B. SUTTON & SONS *do not appoint Agents for the sale of their Seeds; but they deliver them carriage free by Rail to most parts of the United Kingdom.*

CATTELL'S EARLY BARNES CABBAGE; DO. DO. RELIANCE; ALSO PARAGON, IMPERIAL, KING, NONPAREIL, ETC.

JOHN CATTELL has now ready Bedded Plants of the above, at 5*s.* 6*d.* per 1000. No charge for crates, baskets, or packing. Packages of 5000 or more are delivered to London and to the Edenbridge Station of the South-Eastern Railway carriage free. A remittance or reference to accompany orders from unknown correspondents.—Nurseries, Westerham, Kent.

AGRICULTURAL SEEDS, ETC.

PETER LAWSON AND SON, SEEDSMEN AND NURSERYMEN TO HER MAJESTY THE QUEEN, and THE HIGHLAND AND AGRICULTURAL SOCIETY OF SCOTLAND, are now supplying the following seeds of the best quality:—

Italian Rye-Grass, Foreign seed	Dwarf Essex Rape
Crimson Clover (Trifolium incarnatum)	Winter Tares
Alsike Clover (Trifolium hybridum)	Natural Grass Seeds, for Pastures and Lawns, &c. &c. &c.

27, Great George Street, Westminster.

The Gardeners' Chronicle.

SATURDAY, OCTOBER 13, 1855.

THE outcry against bridging over the water in ST. JAMES'S PARK has died away. JACOB OMNIUM no longer swaggers in the *Times;* and Sir JOHN SHELLEY'S Westminster constituents, having discovered that the proposed roadway will be useful to everybody and an injury to no one, have wisely abandoned their opposition to the measure. They seem indeed to have suddenly remembered that the proposal is after all not so much to form a new way to Westminster as to restore an old one, the closing of which, ugly as it was, some two-and-thirty years ago, was one of the most distasteful and despotic acts of the Government of King George the Fourth. Nevertheless, it seems desirable to revert once more to the subject, for the purpose of explaining more fully than has hitherto been done, what Sir BENJAMIN HALL'S plan really is.

The proposed road is for foot passengers and carriages only, not for heavy traffic. It passes out of the west end of Pall Mall into the Park, nearly opposite St. James's Street, and terminates at the Broadway in Westminster, crossing the park and water upon arches, in the manner represented in the accompanying sketch. In order to bring it from Pall Mall the ugly German Chapel next Marlborough House is to be removed, which will also enable Stable Yard to be enlarged, and will give more room for carriages attending levees and drawing-rooms. At the Westminster end the road passes into Queen Square through an old house or two and finally reaches the space in front of the Abbey, joining Victoria Street.

Such is the line of communication which has been so much objected to in a few quarters. It is, we think, impossible to devise one of more importance to the west end of London and to the inhabitants of Westminster, who, if they understand their own interests, will be its most strenuous advocates. It is true that it does nothing for Belgravia; but we entertain no doubt that if the inhabitants of that great quarter can persuade Lord FITZ-HARDINGE to surrender the lease of his house by Spring Gardens, the present Government would be prepared to lend

a favourable ear to any proposal for opening another road into the Strand through Charing Cross, and for thus connecting Belgravia with the city.

With regard to the proposed bridge itself, small as the scale necessarily is on which we are obliged to represent it, there can scarcely be two opinions as to the charming effect which it will produce when executed. It crosses the water upon three beautiful cast-iron bronze-coloured arches, gracefully decorated with statuary, and enriched lamp-posts.* At either end it is connected with the Mall by passing over a colonnade in harmony with the bridge and affording ample communication between the two sides of the Park, exactly where the present walk passes by the margin of the water. On the one hand the Horse Guards will be seen in the distance beneath the arches; on the other will be had a view of Buckingham Palace. The whole will be a structure worthy of the good taste and architectural reputation of Mr. Pennithorne.

Nor will the roadway take anything appreciable from the present park, for it is carried through the masses of bushes, which now extend nearly from the Mall to the water, and which will hereafter to a great extent mask the roadway till it reaches the colonnades. We may also add that the direction of the road is such that only one tree of the least importance will have to be removed.

If we have at all succeeded in making the proposed measure intelligible, we confidently believe that the good sense of the public will put an end to all further cavilling on the subject, and that the sanction of Sir Benjamin Hall's plan will be one of the earliest as well as most popular acts of the next session of Parliament.

We are continually called upon to give our opinion on some particular disease, and to suggest a remedy, without a particle of information as to previous treatment, or any intimation of the conditions under which the diseased plants have grown. Such is the case at the present moment with specimens of Gladioli which formed part of a large bed, consisting of various varieties, all of which seem to have been affected almost indiscriminately by some disease which has caused a total failure. The tubers have either rotted off suddenly at the base when the stem and leaves were apparently healthy, or the whole plant has gradually withered. In either case it should seem that the affection is precisely the same; that of the organs above the roots it is the base of the tuber from whence the roots are given off which is affected; and that the leaves, stem, &c., above the tuber perish only in consequence of the proper supply of nutriment being cut off below, or the little which passes vitiated by decomposed matter.

Now if the roots themselves are examined, their condition will be found such as to make it very probable that the evil has commenced there, and that the base, which consists principally of a complicated mass of vascular tissue, has perished in consequence of some malady affecting, in the first place, their extreme branchlets. The roots consist of a cortical stratum of irregular cells succeeded by ligneous cells, and then by a large cylinder of vascular tissue composed of scalariform reticulated and spiral vessels threaded by large ducts. The first indication of disease consists in a discoloration of some of the vessels, especially those which have a real spiral thread. Other vessels, however, are affected, and after a time they are either completely clogged up by brown matter, or they contain scattered brown granules very distinct, tolerably regular in outline, and larger than those which attracted so much attention in the first speculations on the origin of the Potato murrain. If a root is cut through in this state a black spot appears in the centre, confined to the vascular portion. Matters, however, do not remain in this condition. Fungous threads soon appear in the cavities of the vessels running up the walls or passing from tube to tube, the consequence of which is that the whole portion affected by them decays, and the root is often found to have lost the whole or the greater part of its vascular apparatus by mere decomposition, whether induced immediately by disease or by the action of the fungus, so as to present a hollow cylinder. Under such conditions it is easy to understand that the base of the tuber could not long remain healthy.

Now without an opportunity of inspecting the locality it is perhaps rash to suggest a cause, but as vegetation appears to have gone on well up to a certain point, though it has evidently been checked after a time from the small size of the new tubers, and there is no reason to believe that the disease is due to fungous matter, while the upper portions should seem to have perished simply from the abstraction of the proper supplies, we must look for some external cause, and this may very possibly have been some accidental drought, which has affected the spongelets and thus in process of time induced decomposition and ultimately given rise to fungal mycelium. These Gladioli dive deeply into the earth for moisture, and if a proper supply has failed below during the excessive drought of the past summer, while the more superficial fibres have rapidly absorbed that which has been applied frequently to the surface, it is very possible that an unhealthy condition may have been induced, which has ultimately affected the base of the tuber, and in consequence the vitality of the whole plant. We are convinced that in many a case where the Melon and Cucumber diseases are accused of being the authors of failure, the prime cause of evil has been slight superficial watering, while the deeper roots have been seated in a dry and often a burning soil. In many a case complete drought is less injurious than a mere sprinkling, which, if repeated frequently, renders the plant only more impatient of drought, while the supply is quite insufficient for its wants. It is very possible that in the case of the Gladioli we may be wrong, though we feel sure that the cause has been external, whatever it may have been, and that which we have mentioned is capable of producing such an effect, and accords with our own experience in similar cases; but our remarks will not be useless if they check the practice of frequent but scanty watering. It is very true that Melons will not bear much drenching, at least in our climate, though the continental practice is very different from our own; but it is equally certain that they cannot thrive when the subsoil is void of moisture, and a great bottom-heat is applied. If the spongelets are once affected, or the smaller fibres decay, there will always be danger of decomposition in the larger roots, and this will generally be aggravated by fungi, and according as the decomposition assumes a moister or a drier form will be the rapidity of the affection.

In the case before us it may be added that the mycelium is probably that of Cladosporium herbarum, the most common of all fungi, and which is breaking through the plant in every direction. *M. J. B.*

* These are not represented on the accompanying elevation. They are tastefully connected with the statues.

VEGETABLE PATHOLOGY.—No. XCI.

372. Caries (*Decay*).—True canker may be complicated by the presence of gum, resin, or watery fluid, and its real nature in consequence masked or entirely concealed. Every case, however, in which the more firm or solid portions of a tree are subjected to decomposition is not due to canker. Fungi or insects may have in the first place led to mischief, and a decay of the older parts ensued. In the natural course of things, however, where everything has been perfectly healthy, the organism will not live for ever. As a new layer of bark and wood, and consequently a new set of buds is added every year, life may be prolonged indefinitely in the direction of the circumference, but the older internal portions which have long since performed their functions gradually lose their vitality and become subject to chemical decomposition even where no external agents or accidents favour the process. They acquire in consequence a darker hue, assume the characters of ulmates and humates, and finally the central portions become soft, lose their adhesion and form a friable powdery mass. The decayed matter acts as a putrefactive ferment on the neighbouring tissues, and sometimes becomes moist from the absorption of sap; and the process goes on till some portion of the tree gives way in consequence of the wood becoming too thin or brittle to support the weight of leaves and fruit, and thus moisture is introduced from without or an exit is formed for the decayed matter. The tree finally becomes hollow, and in favourable circumstances the outer portions are still renewed, and sometimes the external fissure is obliterated by the projection of the new structures on either side, and matters proceed till a new cycle of phenomena has run its course and leads to the same result. Decay is, however, seldom dependent simply on the natural course of decomposition. Even where there is no external injury the inmost tissues are soon threaded with the mycelium of parasitic fungi, which aid materially in the decomposition of the firmest structures. The fungus itself soon makes its appearance in various situations according to different specific circumstances, and the agency of the outward elements rapidly aggravates the evil. Under the most complicated circumstances, however, it is astonishing how many years a hollow trunk will resist, producing every year as good and abundant fruit as if the tree were perfectly sound. To take the Apple tree as a familiar instance, whose wood does not in general resist decay so long as many forest trees. No sooner do the internal tissues begin to lose their vitality than they are attacked by the spawn of Polyporus hispidus or other fungi. If the fungus makes its appearance on one side only, decay may be confined to that side, and after a series of years the wood gives way; no more fungi are produced, and the tree becomes hollow; and in this condition, with proper care to exclude the weather, it may continue fruitful for years. In the Oak, on the contrary, the fungus more generally appears at the base and the decay proceeds upwards. In every case, however, where it is desired to preserve a tree either for use or ornament, the great point is to remove the decayed matter as completely as pos-

sible, and then to exclude the action of the outward air and rain. The circumstances of the case will best indicate what is the most proper course to pursue; sometimes where the cavity is small, it may be filled with some cement which will exclude moisture, or it may be closed with a plate of metal; or as a temporary remedy, where it is hoped that the fractured surface may soon be grown over, paint or varnish or some other anti-corrosive application may be used. Judicious measures will often be attended by success, and I could now point out a tree which was carefully tended more than 40 years ago, though then in a very dilapidated state, which is still at this present time in a fruitful condition, and may remain so many years longer. It does not, however, always follow that it is best to cover the cavity. Every one knows how slow the process of decay is in certain cases, where the cavity is subjected to a free current of air, while there is no lodgement of wet, and in some cases, as in the Elm, the surest remedy consists in some external outlet for the decomposed matter. *M. J. B.*

PROTECTING MATERIALS.

My foreman, who is a very intelligent man, prognosticates another hard winter; he says that severe winters always occur in groups of three or four together; therefore we are to have one or two more hard winters. He is as confident in this opinion as though he had the gift of prophecy, and really looking to my own experience, I am half afraid there is some truth in the matter, which makes me shrug up my shoulders rather ominously, for besides the crops here in the open ground being sadly thinned last winter, I had a considerable quantity of glass structures at work, forcing early Grapes, &c., and I do not want another winter season for trouble, anxiety, and coal bills, like the last. It has set me thinking upon what every one of any experience feels to be, if not *the* great want, at least a great want of the gardening craft, an effective material for and method of covering up and protecting pits, frames, hothouses, &c. How often have I in a sharp frosty night when the thermometer outside the forcing-house indicated 15° or 20° of frost, and in the house 60° or 65° (and a roaring fire to keep it there, too), stood and imagined I saw the whole of the glass covered with an effective protecting material, so that one might see all covered up warm, with a moderate slow-burning fire, and retire to rest feeling assured that all would be safe till the morning, come what weather there might. One great evil in many of our forcing-houses is a deficiency of piping; all forcing structures should be so heated that there should be no necessity to work the apparatus so hard; the great *desideratum*, however, is not the putting so much fire heat in, but to prevent so much going out; some effective protection is very much wanted for cold pits for wintering the numberless half-hardy plants in.

I have often thought that the forcing of early vegetables, Lettuces, Radishes, Carrots, Turnips, Potatoes, &c., might be carried on on a much larger scale than it is at present, for the large supply which we have from the Continent, being readily sold at high prices, proves that there would be an extensive sale for such articles if they could be sold at a moderate price. I imagine that they could be grown almost, if not quite as well, under an opaque covering as under glass, for nine times out of 10, when the weather is not frosty, all coverings are best off, and when it is frosty the plants do not want light; if a glass frame, which now costs 12*s.*, could be supplanted by one costing 2*s.* or 3*s.*, a great point would be gained.

Now what have we in the shape of protecting materials? Bast mats, I suppose, are as old as any, but every one knows that one is of very little use against a sharp frost. Two mats are not sufficient, and when they get frozen they are very awkward and difficult to put on or take off; besides two mats thick costs too much, as they will not last more than one season. Some use two mats with a layer of hay or straw between them fastened in with twine, so that they look like a mattress, and this is a very effective covering when dry, but when wet and frozen it is the worst of all.

Straw mats are a very cheap and good article, but they do not last long, and they lack one essential point of a good protection, viz. they are not waterproof. They freeze on, and when wet are heavy and soon rot. Reed mats are more durable, but when saturated with water they are very heavy, and in many places they cost more than many might imagine. I am of opinion that no material will be found suitable for general use that is not waterproof. I need say little about loose straw; it is a very effective covering when the weather is calm; but a cutting east wind in half an hour often blows it all off where it is wanted, and carries it where it will take all the next day to clear it up again. There can be no question, I think, that all these articles are very defective, and with them I must class Frigi Domo; to say that it is a perfect non-conductor and keeps a fixed temperature where it is applied, is quite a mistake. Those who have tried it have decided that as a protective material it is about equal to a single mat.

Canvas made waterproof is employed by a few, but its expense is against its general use: when kept some distance from the glass, so as to have a body of confined air beneath it, it is a most effective covering; but it has some serious drawbacks; it is very awkward to put on or take off unless it is on rollers; and even then, when most wanted, viz. during alternate frosts and thaw, sometimes you cannot roll it up; at other times you cannot get it down. I conceive it must be at times very troublesome; but I confess that I do not speak of it from experience. It is a mistake to think that a protecting material must be flexible. There will always be a difficulty in using it when most wanted in bad weather, and all waterproof textiles, if strong, cost too much. For this purpose some stiff substance, if it could be made light enough would, I think, be much the best, the facility in taking off and putting on being so much greater and surer. Asphalte felt, no doubt, makes a good covering, and I wonder it has not been more used for that purpose; but its cost has been against it—not the price of the felt, but it requires a frame with several bars to fix it on, and then it must be coated with tar, lime, and sand, so that by the time it is finished, it has cost nearly the price of a wooden shutter, which perhaps would be better. Wooden shutters are very effective, but very dear; 6*s.*, 8*s.*, and even 10*s.* in some places for a single shutter will always prevent them from being used. What we want is a cheap light waterproof covering, which could be easily applied. I have been trying various things for some time, and think I have made an advance; but I should like to see this matter freely discussed, for perhaps necessity has given birth to some idea which may be of benefit to us all. Let us hope that something will be done before this winter sets in. *Economy.*

NEW GARDEN FERNS.—No. V.

13. Nephrodium venustum, Heward MS. Aspidium — venustum, Heward, Mag. Nat. Hist., 1838.

Fronds glabrous lanceolate, pinnato-pinnatifid; pinnæ alternate, narrow linear lanceolate, sessile, or, the lower very shortly stalked; segments roundish oblong-obtuse subfalcate; sori submarginal; rachis stellato-tomentose in front.

This is a handsome free growing Fern of considerable size, the fronds being from 2 to 3 feet long, and from 7 to 10 inches broad. They are quite smooth and shining, bright green, pinnate; the lower pinnæ short, and somewhat stalked; the upper ones sessile, tapering from the base to a sharp elongated point. The pinnæ

are cut about half-way down into bluntly-oblong somewhat falcate lobes, which are entire, and slightly ciliated. The sori are submarginal, often becoming confluent in lines. The fronds are adherent to an erect rhizome. It is a native of Jamaica, and was introduced in 1852, to the Botanic Gardens of Kew and Glasnevin. It is an evergreen stove Fern.

14. Lastrea pilosissima, J. Smith MS. Aspidium pilosissimum, G. Don MS., Herb. Hort. Soc. Lond.

Fronds ternate, deltoid or pentangular; the lower branches tripinnate, trapezio-triangular, the posterior pinnæ thrice as long as the anterior ones; apex elongated; pinnules obliquely oblong-ovate, deeply pinnatifid, with oblong or obovate entire or sinuately notched segments; sori small scattered; rachis and costa hairy above, pubescent beneath; stipes hairy.

A very distinct plant, requiring stove heat, a native of Sierra Leone, and introduced to the Chelsea Botanic Garden in 1851, by the late Mr. Whitfield. The fronds are grayish green, herbaceous, and extremely liable to

become blackened by exposure; they grow a foot and a half or 2 feet high, and are three-branched, deltoid, or rather five-angled in consequence of the excessive development of the two divergent basal posterior pinnules. The composition of the central portion, which is equal sided, is similar to that of the posterior or more highly developed side of the branches; these parts are tripinnate in fully developed fronds, the ultimate pinnules being rather bluntly ovate or oblong ovate, and often oblique or unequal sided, deeply pinnatifid, the lobes oblong or obovate, entire or sinuately notched along their margin. The termination of both central and lateral branches is caudate. The sori are terminal on the veins, rather small, scattered over the whole frond, few on each segment. The stipes is densely covered with spreading white hairs, sparingly intermixed with long black hair-like scales; the rachis and costa are hairy above, pubescent beneath; and the upper surface of the frond is furnished with rigid divaricate hairs, which occur also beneath along the veins. This species seems closely related to the Aspidium subquinquefidum of Palisot de Beauvais, but is much more compound. *T. M.*

Home Correspondence.

Method of Cultivating Potatoes Free from Disease.—Use a pretty fair allowance of stable or yard dung, well incorporated previously with as much common refuse salt as will not prove destructive to the vegetation of the plants. Deposit this along the drills that have been opened for the reception of the sets, and place these (moderate sized whole tubers are the best) therein in the usual way on the top of the manure. Then throw over each set a spadeful of wood ashes, and afterwards fill up the drills with the earth that has been raised on either side in forming them. The salt thus supplied not only yields chlorine to the plants (of which there exists a large per centage in their composition, as found from analysis), but effectually prevents worms, slugs, &c., from lodging in the dung, as they would otherwise do; and the wood ashes afford an ample provision of potash, as well as tend to keep the soil dry and porous about them, all the other substances requisite for their food being contained in adequate proportion in the dung. I have never found this system of cultivation fail in averting the disease, as it causes the plants to grow in a most healthy robust state; and it has, moreover, invariably improved the quality, both in mealiness and flavour, and augmented the quantity of the produce of the crop in no small degree beyond what I have ever obtained in using dung alone. Whether the plants are at once able to assimilate to their requirements the chlorine and potash so administered I am not competent to determine, but there appears to me to be no doubt that these adjuncts become available to them in some way or other during their advancement in growth from the application of salt and wood ashes, very different from what is produced when the same substances are supplied to them, either in a simple or compound form, derived through the agency of the chemist, thus demonstrating that in the feeding of plants Nature possesses a talisman congenial to their appetite, and conducing to preserve them in a healthy condition, unattainable by art. As to the Potato being a nitrogenous or non-nitrogenous plant, or how far the state of the atmosphere may exercise an influence in occasioning the blight, I shall leave to others to decide, and with regard to the nostrums that are advertised to produce such wonderful effects, all I have to say is that I have fairly tested, I believe, most of these at a considerable expense, without deriving any benefit whatever, that I could perceive, in remedying the evil. The culture I have recommended for adoption, as stated above, is the result of my own experience; but whether it will turn out equally successful in all cases where it may be practised, of course, I cannot take upon myself to guarantee. As, however, its trials will not be attended with much expense, any of your readers who may be inclined to follow the plan are quite welcome to do so, for I have no intention to take out a patent for the recipe, nor any interest in retaining the secret, if so it may be called, my sole motive in addressing you on the subject arising from a desire to prove serviceable to them. For the benefit of those who may experience a difficulty in procuring wood ashes, I should imagine the manure dealers would find it to their advantage to keep a supply of that commodity for sale in store, in the event of its becoming extensively employed. *P. W., South Wales, Oct. 9.*

Gigantic Cockspur Thorn.—I have just returned from Devonshire, where I noted down the measurements of a specimen of the Cratægus Crus-galli that I now forward to you. It grows on its own stock, and measures in its smallest circumference (close to the ground) 6 feet 8 inches. At the height of 5 feet, and just below the lowest branches, the girth is 7 feet 6 inches. The circumference of its spread is 44 yards, and would be more but for the browsing of cattle and the encroachments of other trees. The maximum semi-diameter of its spread is 29 feet. It flowers and fruits freely, and is now covered with the latter. The blossom somewhat resembles that of the Pear, and the berries are six or eight in a cluster, and of the size of Cherries. The flower is white, the fruit red. There is no specimen of the kind in Kensington gardens, but I am told that there is a small one in those at St. James's Park. *J. F., Parthenon Club.*

Monstrous Cabbage Leaf.—I have sent you a Cabbage leaf, on whose midrib are numbers of small leaflets which grow larger and longer every day; in fact they progress much more rapidly than the leaf itself, and the plant shows no disposition to Cabbage. You will observe that the leaflets also have growths of a similar kind upon them. *Bolehope Fell.* [This is a curious, but not very

unusual condition of the Cabbage. It is one of the proofs that leaves *can* grow like branches.]

Stockwood Golden Hamburgh Grape.—Being about to plant a vinery I am anxious to procure the best Grapes, and have referred to the different periodicals on the subject. Amongst other remarks I found one in the "Cottage Gardener" for July 24th, on the new white Grape Stockwood Golden Hamburgh, which is said to be a seedling from Black Hamburgh, hybridised by "White" Sweet Water, and no doubt very excellent, but stated to be second to the Frontignan. On the 14th August I find words to the following effect:—"We cannot speak too highly of this Grape, which is without doubt the best of all except the Muscats." On Sept. 4th we have a full description of it in a leading article, in which the writer gives the preference to the Muscats only. Am I to understand that it is now found to be superior to the Frontignan? Is it not a curious circumstance that the Golden Hamburgh is an oval berry when neither of its parents are so? I should without at all doubting the merits of the Grape be inclined to think there is some mistake about its parentage. I have seen a white Grape in this neighbourhood raised evidently from the Black Hamburgh, which has all the characteristics of its parents except colour, which is a bright amber; form, size, flavour, habit, all correspond. The raiser has received letters from some of the leading horticulturists, who have seen it and all pronounce it good, and say that it is equal to the Golden Hamburgh, but quite distinct from it. Do you not think that this will be a great acquisition also? Will some of your correspondents favour me with the names of six or eight Grapes they particularly recommend? *C. Reid, Perry Bar, near Birmingham.* [We have always understood that the Golden Hamburgh was a pure seedling, not hybridized. We should say that too little is as yet known about it to justify very positive assertions. When we saw it we thought it an excellent variety; but we have only seen it once.]

Specific Gravity of Different Bodies.—It is interesting to read the reports of the British Association held at Glasgow this season, but there are some assertions connected with gardening which, if collected and made known, would perhaps puzzle some of the philosophers to understand them, but coming from the cultivators of Cabbages, of course they would be little esteemed. Water, we are told, is generally the substance employed for ascertaining the precise weight of any body, which is a very curious branch of the science of hydrostatics. The reason why any body floats in water is that, taking bulk for bulk, it will be found lighter. This relative weight in bodies is called their specific gravity, and water is always taken as the standard for the specific gravity of all bodies. If a body when thrown into water displaces a column of that liquid greater than its own bulk, it will immediately ascend to the top and float upon the surface, with as much of its bulk below as corresponds exactly with the quantity of water displaced; on the contrary, if it displaces a body of water less than itself it will sink to the bottom. It is on this account that a piece of marble will sink and a piece of cork will swim. In hydrostatic calculations, water, as the standard from which the respective gravities of other bodies are taken, is reckoned as unity or 1, 100, 1000, &c.; a cubical foot of it weighs 1000 ounces avoirdupois. Taking water at 1000, cork will be about 240, and the comparative weight of sand will be about 2590, and it is a common thing for cork to float and sand to sink. Yet I find in some of my operations that sand will rise through water and float upon the surface like cork. *P. Mackenzie, West Plean, Stirling.*

Effect of Overfumigating Vines with Sulphur.—A friend of mine erected a vinery about three or four years ago, and planted young Vines in it; they grew exceedingly well until last year, when the gardener having some plants with vermin on them in the same house, gave the whole a severe fumigating with sulphur, using by mistake twice as much sulphur as he ought to have done. The leaves all dropped off the Vines immediately, and the fruit which was then fully grown ripened badly. Since that time the wood is puny, and the fruit is small and poor in quality. Will you say if that overdose of sulphur was sufficient to cause this bad condition in the Vines? and if so, is the evil likely to continue much longer? The border for these Vines is 12 feet wide, and is raised rather high towards the house. The gardener says that the border is too narrow, and too high; is he right? Any suggestion to clear up this business and to effect a remedy will be thankfully received. *Roaldus.* [If, as we infer from your statement, your gardener *burnt* sulphur and so killed the foliage of your Vines, he ought to have known that such mischief would happen. You had better cut the Vines hard back in the winter. We see nothing the matter with the border.]

Grafting or Budding Walnut Trees.—Are Walnut trees ever grafted or budded? and if so, when is the best time for so doing? Several gardeners have been asked the question, but none of those asked had any idea or had ever heard of such a thing. It is well known that the tree raised from the Walnut seed does not produce a nut like the seed sown; for instance, a nice flavoured small nut sown produced a large half-filled French Walnut kind, with inferior flavour to the seed, and *vice versâ.* I should be obliged by any information on the subject. *A Constant Reader.* [Walnuts may be both budded and grafted, by taking proper precautions; especially by performing the operation after growth has well commenced. Full details are given in the Theory and Practice of Horticulture, p. 338.]

Grafting Embryos.—Your article on this subject at p. 627 has led me to try the experiment. I am not sure, however, that I fully understood your meaning, as I find some difficulties which I cannot satisfactorily explain. My experiments were made on the kernels of Peaches and Nectarines, and on the seeds of the common Nasturtium and Tropæolum canariense, the two former and the two latter being respectively grafted together. I found it impossible, by merely skinning the kernels, to place the surfaces in sufficient contact to bear the tying together, as they are rounded and very slippery, and you did not, I believe, in your remarks say anything about cutting or paring them down, so as to make the surfaces fit each other, which appears to be the only likely way of performing the operation neatly. If they are to be cut, in what direction is it to be done? The cotyledons of a Peach or Nectarine when separated in the kernel somewhat overlap each other at their inner edges, and in whatever direction they can be cut would be so injured as to destroy the form of the future leaf. But supposing that two or more were cut to fit each other, and could be made to grow together in the embryo, I cannot see that it would produce any effect on the future plant if the axes of the cotyledons remained free, as the roots and stems of the grafted cotyledons would then grow from those points independently of each other. The only plan of forming them into one plant appears to be by grafting the embryos at the axes of the cotyledons. Supposing this to be practicable each side of the graft would represent half of the diameter of the root and stem of the young plant; and the thing to be proved by the experiment is, I suppose, whether the leaves afterwards developed during growth will gradually lose their identity and produce a similar effect on the buds they may nourish, so as to give rise to a fruit of a twofold character. How such an effect can be produced any more by this plan than by the ordinary method of grafting does not appear very plain, as in both cases the wood alone is acted upon. Should not the operation be performed on the blossoms of the trees? for if that is practicable I can understand that the object might be attained. [No.] Let us trust that you will favour us with further information on the subject. *Gamma.* [We think the embryos must be pared down. You cannot graft wood itself by mere contact. But the mode of carrying out this operation is precisely that which must be made the subject of the proposed experiment.]

Sulphured Hops.—The fault does not wholly lie with Hops. Maltsters are well known to use sulphur in drying off malt to give it a brighter colour, such malt bearing a much higher price. *A Constant Reader.*

Vine Borders.—I shall be glad of advice under the following circumstances. I am making a new kitchen garden, and am now forming the borders in front of a greenhouse for Vines, from hints which I have taken from your Journal. In page 205, 1847, dead lime rubbish is recommended to form a portion of the composition. My nurseryman says that nothing is so poisonous to the roots of trees as that is. Is this so? I am about to pull down a building upwards of 100 years old, and shall have plenty of dead lime rubbish, if it is desirable to use it. The border will be 11 feet wide and 2½ feet deep, on a substratum of broken pieces of stone 1 foot deep, passing from the house to a drain; I propose to cover the stones with a thin coat of old lime rubbish, well beat down, to prevent the roots of the Vine from penetrating through the stones to the subsoil, which is not good. The site of the ground being on the slope of a hill, and the position of the greenhouse in other respects making it desirable to have it below the surface of the ground, the top of the Vine border will be only 6 inches below the sill of the front lights. My gardener says that will be an advantage. Is it so? In page 683, 1847, plaisterers' rubbish is again recommended, and materials from the tan-yard. The latter are now sold here for 14*l.* a ton, which is rather too expensive. I have a quantity of old must, the refuse of the Apple, which has been converted into cider; it has been lying for some years in a heap till it has become black and decayed. Is there any value in this? I am told that it is worthless as manure; would it be injurious to the garden mould if mixed with it? There is a new manure advertised under the name of nitrophosphate, a blood manure; would not this be good to mix up with the composition for the Vine borders, and in what proportion, though the price is rather high? *H. W., October* 8. [Lime rubbish, and especially plasterers' rubbish, is an excellent material for Vine borders. Tanners' refuse is also good: but not at all necessary. Bones crushed, and rotten dung—not too much of the latter—do as well. It is advantageous to have the border sloping well away from the front wall—*only* because it is thus kept warmer and drier. Decayed must is like decayed leaves or rotten wood; you cannot call it a manure. With the action of nitrophosphate we are unacquainted. Have any of our readers used it?]

Treatment of Orchids.—It has been repeatedly stated in your columns that Orchids do not require so high and moist a temperature as we generally find them grown in by some of our best cultivators. It is true that our Orchid growers are for the most part very successful both in cultivating and flowering their plants. But still the cost, trouble, and expense of the Orchid-house too often exceeds the gratification derived from it, besides which the great amount of heat and moisture maintained frequently deters those for whose pleasure the plants are cultivated from entering the house to examine or admire them. That the plants require a somewhat high temperature I allow, but that they must be cooped up in a close and very moist house I cannot believe. On the contrary such a practice appears to be unnecessary, and I am convinced that under contrary treatment the plants will succeed equally well. This summer several plants of Cymbidium aloifolium, Cattleyas Mossiæ and granulosa, Dendrobium nobile, Vanda Roxburghi, and others, were removed from the end of a very hot pit in the early part of the summer (in consequence of repairs, &c.), and placed in a greenhouse, the average temperature of which seldom exceeded that of the open air. The top of this house, which was on the ridge and furrow system, fell off at the back into a kind of recess or room immediately below a couple of chambers which formed part of a dwelling-house, and which effectually prevented the rays of the sun from scorching the plants within it. Now this recess, or part of the house, which was of some considerable size (45 feet by 15), and which contained several Orange and other trees, was selected as a repository for the outcast Orchids, which were either hung on the branches of the Orange trees or, as was the case with those in pots, placed on a pavement of white sandstone, and therefore were in a colder position than those suspended on the branches above them. Now under these conditions the plants grew and flowered far better than they did the preceding year in a hothouse whose temperature seldom fell below 75°, and sometimes reached 100°. Now to-day, by way of experiment, I placed immediately below a flower spike of Stanhopea tigrina a thermometer, so as to be enabled to ascertain the exact temperature in which the plant was blooming. This I found to be exactly 66°, and it frequently fell at night to 45° or 50°, so that I am now convinced that some of our most beautiful Orchids will bloom freely if placed in a tolerably shaded situation at the temperature I have mentioned. Of course I am not speaking of the more tender and valuable species. The plants above referred to were seldom watered during the time they were in the greenhouse, and the ventilators and doors were kept constantly open, so that there was nothing to impede a free current of fresh air from circulating among the plants. One of the latter (Dendrobium nobile), which was placed on the pavement, sent out shoots fully a foot long, and I never remember having observed a plant of this description looking more healthy or flourishing. It, however, did not flower as the Cattleyas, Stanhopeas, &c., did, it having, as I am told, not been in the habit of flowering for the last year or two; in the cool temperature of the greenhouse, however, I believe from its appearance that it would soon do so. To be able to observe these curious and beautiful productions during the heat of summer in a cool and shady greenhouse or conservatory, more especially when suspended from the larger trees and shrubs, or placed on stands amid them, is indeed a treat compared with the risk which some persons sustain from entering the close and humid houses in which we generally find them confined, and I trust that the hints here thrown out may be the means of making it more generally known that numbers of these fragrant and beautiful plants will flower and flourish during part of the year in any ordinary greenhouse or conservatory, without any of those extreme applications of heat or vapour generally afforded them. *Strathfieldsaye.*

Societies.

Entomological, *October* 1.—J. Curtis, Esq., F.L.S., President, in the chair. An extensive series of donations to the library was announced as having been received from the Natural History Societies of Belgium, Moscow, the Society of Arts, Messrs. Hewitson, Zuchold, Newman, &c. Mr. F. Smith exhibited an extensive series of rare Coleoptera, especially rich in Curculionidæ collected by himself during the past month at Deal, and Mr. Dawson a number of specimens of the hitherto unique Harpalus cordatus, from the same locality. A box of insects from Perthshire was also shown by Mr. Foxcroft. Mr. F. Bond exhibited the rare moth Heliophobus hispidus, from the Isle of Portland; Mr. Newman a specimen of Kirby's Xylocopa iricolor, a large imported species of bee, taken at Dulwich; and Mr. Power a specimen of Dinodes Maillei, a native of Turkey and Greece, which had been taken by Mr. A. Adams at Gurnard Bay, in Moss, near the western extremity of the Isle of Wight, also Elaphrus lapponicus. Mr. Stainton exhibited a new Lithocolletes, reared from the leaves of Vicia Sepium, and Mr. Curtis a gigantic scorpion from Sierra Leone. Mr. Westwood stated that he had received information from Mr. Mitchell of the destruction of a considerable quantity of Turnips by the attacks of aphides, which in their turn were devoured by the larvæ of Syrphideous flies. Mr. Curtis stated that he had been informed that the crops of red Cabbage near Cranford had suffered materially from the attacks of aphides. Mr. Westwood stated that he had observed that the past summer had been very propitious for the propagation of obnoxious species of sawflies; the Rose sawfly, the slimy larva of the Pear and Plum tree-leaves, and the Gooseberry sawfly had been superabundant. Mr. Lubbock stated that the nigger caterpillar of the Turnip had also appeared in large numbers in Kent. Mr. F. Smith stated that he had captured the fly Elachiptera brevipennis in the act of depositing its eggs in the body of a living Nabis subaptera. Mr. Douglas communicated a note on Elateridæ preying upon aphides. A note was read by Mr. Atkinson on several species of Indian butterflies, and one by Mr. Newman on the manufacture of hats impervious to wet,

from the silken texture obtained from Saturnia spini by the process invented by Herr Pretsch, of Vienna. Mr. Douglas mentioned the capture of the rare Licinus depressus and Tarus axiliaris, near Croydon. A letter from Mr. Bowring was read, giving an account of his entomological captures during his visit to Siam in company with his father, Sir J. Bowring; and Mr. Westwood communicated a paper on the Australian species of Pselaphidæ, in the collection of the late A. Melly, Esq.

British Pomological, *October* 1*st*. — Mr. Robert Hogg in the chair. Amongst other fruits exhibited were samples of the Oldenburgh Nectarine, from Messrs. Veitch and Son, of Exeter; this is a good melting and richly flavoured white-fleshed freestone variety, quite equal to any in cultivation, and from its condition so late in the season (from Devonshire) leads us to suppose it may be an acquisition. Some specimens of the Stanwick were exhibited from the same nursery, exceedingly fine and well grown, but devoid of flavour. The Red Nectarine Peach, of which samples were sent, is a bitter kernel Syrian variety; they were past their best, but gave evidence of the value of the variety. *From an Occasional Correspondent.*

Notices of Books.

Books for the Country—The Kitchen Garden. By E. S. Delamer. Routledge & Co. Small 8vo, pp. 184.

This little work contains information that may prove useful to the class of readers for whom it is intended. It has good remarks on the situation, plan, and mode of cropping a kitchen garden, but when the author comes to treat of gardening tools, it does not appear to us that he has had much practical experience in their use. "The English spade is a good implement, but it is too broad in the iron, and too short in the shaft for many soils and many workers. Women and boys can dig with greater ease, and even grown men can get over their work more quickly, digging at the same time to an equal or a greater depth, with the French spade, which somewhat resembles the implement used by the Lincolnshire marshmen to excavate their drains and ditches. The iron is 10 or 11 inches long, and 5 or 6 broad at the most, being narrower at the bottom than at the top. The shaft is five or six and thirty inches long, including the handle at the top, which is simply a cross piece of 3 inches. The long leverage of handle and the narrowness of the blade allow it to be used with less resistance from the soil, which at the same time is more finely divided than it would with a broader iron." Now, we differ from the author in nearly all these statements. In the first place, 10 or 11 inches of blade is too short for kitchen garden digging; and 5 or 6 inches too narrow except perhaps for such adhesive subsoils as the Lincolnshire marshmen have to excavate; tender soil would mostly fall off before it could be turned over, and no soil but what is friable is fit for a kitchen garden. For ordinary work a shaft of 36 inches is too long. Let any one practice, by himself, with such a long handled spade till he considers himself quite expert in its use; then let him try alongside one who can use a good English spade, such as one of Lyndon's patent, and the superiority of the latter implement will soon be apparent. To dig with ease the handle of a spade must be grasped with one hand, whilst in lifting the other should grasp the shaft at a distance of little more than the breadth of the man's shoulders from the other hand; farther apart, the power becomes diminished, both as regards lifting up and pressing down. A long handle may, however, be grasped at the proper distance between the hands; but then the weight of the soil on the spade would have double the leverage that it would on the common short-handled implement. In short, the English spade has properties which no other form can possess, as far as regards adaptation for digging kitchen garden ground.

The instructions for the sowing, planting, and general cultivation of crops are in accordance with those usually given by good authors. Some botanical names require correction, such as Leontodon tarexicum (taraxacum), Saturcia (Satureja); and among the names in a list of Pears, we find Beurré Capriomont, Muirford Egg, Beurré Rose, instead of Beurré de Capiaumont, Moorfowl Egg, and Beurré Bosc. The sorts recommended are, however, of more importance than these apparently typographical errors. The Bon Chrétien d'Été, and several others should not have been included in a list of those for ordinary cultivation.

The above, however, are exceptions to the general merit of the work, which "merely professes to act as a truthful and serviceable guide to aid beginners on their horticultural journey." A useful calendar is appended.

Garden Memoranda.

Mr. Salter's Versailles Nursery, Hammersmith.—Several things now in flower in this nursery deserve attention. In the first place, Mr. Salter has a good collection of the different kinds of Scarlet Geraniums, many of them novelties just imported from the Continent. Among the more striking of these and other little known kinds grown here were Hamelins, a rosy salmon sort with a broad white border and horseshoe-marked leaves; Louis Chaix, a pinkish salmon with a small white eye; Criterion, also pinkish salmon, with broadly marked horseshoe leaves; and Christianum, a small dwarf-growing kind of the same colour. Among white-flowered varieties of the scarlet class, Blushing Bride, a kind with horseshoe-marked leaves, is certainly one of the best. It is a considerable improvement on Boule de Neige, its flowers being larger and better shaped than those of that variety, and quite as good a white. Of clear pink kinds with a white eye we need scarcely say that Lady Holmesdale is still a favourite. Triomphe de Mont Rouge, a white, delicately suffused with pink, is also extremely pretty, and well deserving a place in every collection. Of kinds with scarlet flowers, Charles Sternaux is one of the most brilliant, without horseshoe on the foliage; Warnford Pet is also a large bold scarlet; Bishopstow, scarlet, is less robust, and, being brilliant in colour as well as compact in growth, looks as if it would be a good kind for bedding purposes. Beauté Meldoise, apparently a strong grower, has flowers of more than ordinary size and brilliancy. Variegated Geraniums are also plentiful here, and among them were some finely scented sorts.

Among other things we noticed some of the new Fuchsias with white corollas, both single and double; the plants, however, were so young, and had so few flowers on them that no opinion could be formed of their merits further than that they appeared to be free growers, and looked as if something good might be made of them. Of Sedum Sieboldi we observed some fine plants under glass, and when well grown as these were, nothing in a common way could possibly look handsomer. For placing in vases in halls, or for covering and rounding off as it were sharp corners of shelves, few plants are better adapted than this Sedum, and it is so hardy that it will live out of doors; but when placed there, except it is protected in some way, slugs are apt to eat and disfigure it. Of plants in suspended baskets a variegated variety of Vinca major had a fine appearance, its branches drooping several feet below the bottom of the basket. Several other common plants, including even the little trailing Linaria cymbalaria, are also grown here as "hangers," and skilfully used many other plants of this kind might be employed with great advantage in the decoration of our greenhouses, and would cost nothing beyond the trouble of collecting them. A variegated variety of Arundo Donax was growing under glass here, and a very handsome plant it is, its leaves being beautifully striped with white; along with it were also variegated Veronicas, Polemoniums, Neriums, Fuchsias, Coltsfoot, and other plants with fine foliage. We also noticed here an orange-flowered seedling Tropæolum, in the way of Caroline, named Brilliant, which may prove useful on account of the brightness of its colour. We likewise remarked plants of the Pampas Grass growing under glass in pots. Mr. Salter has found that when planted deep and kept in doors, they make plenty of roots, and may be divided into separate plants with every certainty of succeeding; but that dividing plants grown out of doors does not always answer, on account of their roots being coarser and more destitute of fibres.

Of novelties among Dahlias, of which a good collection is grown, may be named Inimitable, a salmon and buff kind striped with red; Alfred Salter, a large bold scarlet kind; Le Phantasque, a crimson tipped with white, the latter very clear and distinct; Kaiserin v. Oesterreich, a purplish lilac tipped with white; Richard Wagner, a dark claret tipped with white; Imperatrice Eugenie, a purplish violet broadly tipped with white and very showy; Madame Alfred Perignon, of a bronzy lilac shade tipped with white; Cornellius, a blush tipped with rose; Gold border, a German flower of a warm orange brown colour edged with yellow, and were it not for its "hard eye," very pretty; Gurnerbraut, white tipped with cherry, a small and attractive flower for bouquets, for which we believe it is much employed on the Continent; and Duchesse de Brabant, a rich golden orange kind which can scarcely fail to become a favourite. These comprise some of the best of the new Continental kinds, of which there is annually an abundance.

Chrysanthemums promise to bloom well here this year, and, as we understand they are to be planted out under glass in beds so as to form a kind of winter garden, they will doubtless have a fine appearance. In the open ground the yellow and white varieties of Chrysanthemum frutescens were in bloom, and showy beds they make, more especially the white sort, which flowers most profusely and is very compact in growth. These if lifted and potted before the frost injures them, bloom well all winter in the greenhouse, and at a time when flowers are most wanted. Of the yellow kind, Mr. Salter has a handsome double variety, very bright and clear in colour. In the open border here, we noticed a fine mass of Funkia grandiflora in bloom. The pure white flowers of this plant being sweet-scented are said to be much used on the Continent for wedding bouquets when Orange flowers or Tuberose cannot be had.

Fruit has here, as elsewhere, been most abundant this year, and some of the Apples more especially have been unusually large. One of a sort called the Giant, a large green cooking Apple, weighed 1 lb. 1 oz. Peaches and Nectarines on open walls have succeeded well, with the exception of the Stanwick, which did not ripen perfectly; a few gathered hard and green, however, very much improved in this respect after they had been indoors for a time, but still their flavour was not near equal to what it should have been.

Dioscorea Batatas, turned out on a border here, would seem to confirm what has been said about it, viz., that our climate is too cold for it. Out of a hundred planted, scarcely a dozen are now alive, and these are less in size than when they were put out. Of Holcus saccharatus we noticed several large plants in the open border luxuriant and healthy.

FLORICULTURE.

Dahlia and Hollyhock Competition.—At the great exhibition of these flowers, open to the United Kingdom, which was lately held in Edinburgh, in connection with the Caledonian Horticultural Society's show, the following premiums were awarded:—*Dahlias.*—For the best 24 blooms, produced by nurserymen. The 1st prize was gained by Messrs. Downie and Laird, for the following sorts, viz.:—Pre-eminent, Rachel, John Keynes, Immortal, Mr. Seldon, Duke of Wellington, Fanny Keynes, Plantagenet, Beauty of Slough, Bob, Miss Caroline, Sir F. Bathurst, Edmund Foster, Mrs. Ferguson, Ruby Queen, Malvina, Admiral Dundas, Lady Folkestone, Annie, Empress, Frederick Jerome, Port Royal, and Sir C. Napier. The 2d prize was awarded to Messrs. J. & R. Thyne, of Glasgow, for Robert Bruce, King, Lady Folkestone, Edmund Foster, Triumphant, Sir F. Bathurst, Lady Bathurst, Shylock, Rose of England, Yellow Standard, Plantagenet, Primrose Perfection, Glory, Lilac King, Sir C. Napier, Amazon, Edward Harrison, General Canrobert, Negro, Duke of Wellington, Queen of Whites, General Faucher, Empress, and John Keynes. The 3d prize was awarded to Mr. Handasyde, of Musselburgh, whose blooms were Robert Bruce, George Glenny, Agincourt, Fanny Keynes, Mr. Seldon, John Keynes, Lady Folkestone, Bob, Beauty of Slough, Sir R. Whittington, Rachel Rawlings, Edward Harrison, Lady Bathurst, Reine des Matins, Lord Bath, Primrose Perfection, Caractacus, Port Royal, Rosea elegans, Gem of the Grove, Rose Unique, Sir C. Napier, Empress, and Beeswing. For the best 12 blooms produced by practical gardeners and amateurs. The 1st prize was gained by Mr. Henderson, gr. to C. K. Sievwright, Esq., Cargilfield, who produced the following sorts:—George Glenny, Robert Bruce, Beauty of Slough, Bob, Sir F. Bathurst, Lilac King, Plantagenet, Rachel Rawlings, Annie, Amazon, Mrs. Ferguson, and Sir R. Whittington. The second prize was awarded to Mr. Oswald, Murthy Castle, for Fanny Keynes, King, George Glenny, John Keynes, Sir F. Bathurst, Miss Susan Sainsbury, Mr. Seldon, Duke of Wellington, Miss Caroline, Lady Bathurst, Abbe-Von, and King of Yellows: the stand which stood third in order of merit was disqualified from want of the proper declaration. The third prize was therefore awarded to Mr. Walker, gr. to J. Mood, Esq., Rosehall, for Robert Bruce, King of Yellows, Plantagenet, Lilac King, Bob, Annie Salter, Nil Desperandum, Rachel Rawlings, Mr. Seldon, Amazon, John Keynes, and George Glenny. For the best six blooms produced by practical gardeners and amateurs, not growing more than 40 plants. The first prize was gained by Mr. Henderson, with Rachel Rawlings, George Glenny, Plantagenet, Beauty of Slough, Lilac King, and Sir F. Bathurst. The second premium was awarded to Mr. Berry, gr. to R. Newton, Esq., Newington, for Beauty of Slough, John Keynes, Queen of Lilacs, Edmund Foster, Sir F. Bathurst, and Duke of Wellington. For the best 12 blooms of Fancy Dahlias, produced by nurserymen, the prize was awarded to Messrs. Downie & Laird, for Triomphe de Roubaix, Jonas, Miss Ward, Princess Charlotte, Topsy, Comet, Emperor de Maroc, Baron Alderson, Kossuth, Pigeon, Unanimity, and Phaeton. For the best six Fancy Dahlias produced by practical gardeners or amateurs, the prize was awarded to Mr. Walker, for Topsy, Duchess of Kent, Glorie de Kain, Wonderful, Emperor de Maroc, and Kossuth. *Hollyhocks.*—For the best and most distinct 11 spikes produced by nurserymen, the prize was awarded to Mr. Chater, Saffron Walden, for the following sorts, most of them seedlings, and those marked with an asterisk being particularly fine:—President, Cream, *Lilac Queen, *Golden Sceptre (orange), *Queen of Buffs, Prince Albert, Mont Blanc, Hon. Mrs. Ashley, Fairy, *Queen Victoria (light fawn), and Pourpre de Tyre. The 2d prize was awarded to Messrs. Ballantyne & Sons, Dalkeith, for Emperor, Agricola, Glory of Cheshunt, Beauty of Cheshunt, Rosy Circle, Felicia, Unique, Pourpre de Tyre, Souvenir, Hon. Mrs. Ashley, and Lizzy—the three last being particularly fine. The 3d prize was assigned to Messrs. Downie and Laird, whose best spikes were Beauty of Cheshunt, Duchess of Sutherland, and Mrs. Ashley. For the best and most distinct nine spikes produced by practical gardeners or amateurs, the 1st prize was gained by Mr. Pow, gr. to A. Berwick, Esq., of Norton, with Watford Surprise, Beauty of Cheshunt, Pourpre de Tyre, Hon. Mrs. Ashley, Lizzy, Solfaterre, Beauty of Beechwood, Unique, and Yellow Model. The 2d premium was awarded to Mr. Cossar, Kingsmeadows, for Prince of Orange, Walden Gem, Sulphur Queen, Beauty of Tweeddale, Agricola, Eva, Beauty of Cheshunt, Pourpre de Tyre, and Shaded Model. The 3d prize was assigned to Mr. Laing, gr. to the Earl of Rosslyn, whose kinds were Mrs. Ashley, Agricola, Yellow Model, Emperor, Lizzy, Joan of Arc, Beauty of Cheshunt, Emily, and Miss Ashley. For the best and most distinct 5 spikes produced by practical gardeners and amateurs, not growing more than 30 plants, the 1st prize was gained by Mr. Henderson, with Unique, Emily, Beauty of Cheshunt, Mrs. Ashley, and Joan of Arc. The 2d prize was awarded to Mr. Melville, gr. to A. Blair, Esq., Beechwood, for Souvenir, Pourpre de Tyre, Mrs. Ashley, Mrs. Forster, and Emperor. The prize for the best spike in the exhibition was gained by Mr. Chater with Queen of Buffs. The award of One Guinea and a Half offered by Mr. Bircham for the best 7 spikes of sorts and seedlings sent out by him, was awarded to Mr. Pender, Moredun, for the following sorts, viz.,—Golden Nugget, Pourpre de Tyre, Hedenham Rival, Yellow Model, Jenny Lind, Solfaterre, and Meteor. The prize of One Guinea and a Half offered by Mr. Charter, for the best 7 spikes of sorts let out by him, was awarded to Mr. Blackwood, Peebles, for Rosea grandiflora, Safranot, Souvenir, Sulphur Queen, Rosy Circle, Lilac Model, and Eva.

Miscellaneous.

On the supposed Influence of the Papaw on Meat.—It is commonly believed, both in the East and West Indies, that this tree has the property of rendering tender meat of any kind that is brought near it. In Ceylon the opinion is that the effect is secured merely by suspending the meat beneath the foliage of the tree during the night. In Barbadoes greater reliance is placed in wrapping the meat in its leaves for a few hours with a portion of the young fruit. The trials I had made afforded negative results, tending to prove that the effect on the meat was owing to other and incidental circumstances, rather than to any special power possessed by the plant. I shall mention one in illustration. Of two fowls killed at the same time one was wrapped in the leaves of the Papaw by my cook in the most approved manner, not neglecting the introduction of a piece of the young fruit; the other was similarly treated, substituting the leaves and fruit of the Squasse (*Cucurbita Pepo*, Linn.). Both roasted were found equally tender. Other trials, using the leaves of other plants, gave like results. The juice of the leaf, to which by some the supposed effect on the meat is attributed, appeared, as well as I could judge, to possess very little activity. It is milky, almost insipid, or only in the slightest degree acrid, and only after many hours promotes fermentation, and that in a very slight degree when added to a solution of sugar in water. The incidental circumstances alluded to, whether the suspending

of the meat under the leaves of a succulent plant exhaling moisture, or the wrapping it in the same, may be sufficient to account for the softening effect on the meat at a temperature such as that of Ceylon or the West Indies, so favourable to rapid change, that change on which tenderness in meat depends, without reference to any occult virtue in the plant. *Dr. Davy in the Edin. New Philosophical Journal.*

Radishes (Raphanus sativus) find in the South and East climates much more genial to their constitution than with us, and the roots acquire a large size, red, white or black (although we have never seen any of those yard-long black Radishes mentioned as having been exhibited at Moscow), but the flavour is seldom so mild and delicate as in our gardens. Both the long and the Turnip-rooted were known to the ancient Romans, and Professor Targioni, reading in botanical works that Raphanus sativus is a native of China, appears somewhat puzzled to imagine in what remote times it could have been imported from thence to Rome. The fact is, there are no more wild succulent-rooted Radishes in China than elsewhere, and any one who observes with an unprejudiced eye the varieties of shapes assumed by the pod of the R. raphanistrum on the shores of the Mediterranean, can scarcely fail to come to the conclusion, that he sees in that species the wild prototype of our garden Radish. *Journal of the Horticultural Society*

Calendar of Operations.

(*For the ensuing week.*)

PLANT DEPARTMENT.

Conservatory, &c. — We must now be expecting cold nights and occasionally damp cloudy weather, and if there are any plants here likely to be injured by a rather low temperature they should be removed to better quarters at once if they are expected to be of any farther service. Should the weather necessitate the use of fire-heat be as sparing of this as possible, using it merely when absolutely necessary to prevent injury from damp, and to maintain a temperature between 40° and 45°. Where it can be done it will be advisable to water in the morning, so as to allow of having the floors, &c., dry before night, as there will now be considerable danger from excess of moisture in the atmosphere at night, particularly where Camellias and other things easily injured by damp are in bloom. Chrysanthemums will now be in a forward state, and such as have their buds prominent should be got under glass, and if it is desirable to have them in bloom as soon as possible they may safely be placed where a little artificial warmth can be afforded them; but see that they are placed near the glass and well supplied with manure water, and give air very freely, as anything like confinement soon ruins these. Indeed the whole stock of these should now be placed where it can be covered at night in case of frost, for although they will bear more frost than most things, it is not good policy to leave them to the mercy of the weather after this season, unless in favoured localities; but it will be better to place them in skeleton frames or any sheltered situation where they can be covered in case of need, than to huddle them too thickly together under glass, or to put them under the shade of Vines. See that tree Violets are perfectly free from their enemy red spider, for if the foliage is allowed to get disfigured at this season the plants will be unsightly for some time. Greenhouse.—See that Epacrises and other winter blooming things are placed in a light part of the house, where they will be fully exposed to the sun, so as to get the wood well ripened, and ensure their blooming freely. Examine Heaths and anything else subject to mildew frequently, and apply sulphur immediately the pest can be perceived. Water must be very carefully applied at this season, especially in the case of large specimens, for there is much more danger in overwatering now than when the weather is warmer and the plants more active. therefore look over the plants frequently, and never water until it is necessary. Any of the late growing Heaths which may be in want of more pot room may still be shifted, but do not expose them to cold winds and water very carefully afterwards, for the roots cannot be expected to progress very rapidly at this season. Get everything requiring it nicely tied as soon as possible, so as to give the plants a neat appearance, and render the house as interesting as possible, in the absence of any grand display of bloom.

FLOWER GARDEN AND SHRUBBERIES.

Where alterations are in hand concentrate all the strength that can be commanded upon this work, and get the removal of large Evergreens, &c., effected as soon as circumstances will admit, for the most favourable season for this work will soon be past. And now that the weather is showery not a day should be unnecessarily lost in getting whatever large plants it may be intended to remove this season into their fresh places, as if transplanted at once there will be a chance of the plants forming a few fresh roots before winter, therefore see to getting this kind of work forward as rapidly as possible. The scarcer varieties of variegated Geraniums should not be risked in the beds too long, but had better be taken up and potted immediately the weather becomes threatening for unless they can be covered at night in the event of frost, and even then they are hardly likely to be of any service in the flower garden much longer this season, and as it is a work of time to get up a good stock of these, they should not be risked out too late where it can be avoided. After potting it will be a good plan to place them on a gentle bottom-heat in a pit or house where the atmosphere can be kept sufficiently dry to prevent injuring the foliage; here they will soon get hold of the soil, and may then be stored away for the winter in a cool, dry house. Any of the beds which have become shabby, and that are to be planted with bulbs or anything else for spring flowering, should be cleared at once and replanted. Keep the grass short and frequently rolled, so as to prevent the growth of Moss, and keep the surface hard and smooth. Also roll gravel walks frequently in damp weather, so as to render them hard and smooth.

FORCING DEPARTMENT.

Pineries.—If the bottom heat is obtained partly from tan and partly from pipes under the bed, as is frequently the case where the pot system of culture is practised, care must be observed not to get it too strong, of which there will be some danger, owing to the increased amount of fire heat that will be necessary after this season. Provided there is the means of stopping the circulation in the pipes under the bed, as there always should be, the temperature will be very easily regulated, but where the one set of pipes cannot be worked without the other the bottom heat must be frequently examined, especially where fresh tan has lately been added, and if found to be getting too strong the pots should be slightly raised, drawing the tan from about them. Any excess of bottom heat is very injurious to Pines at any season, and would be particularly so now when the injured roots would not be so speedily replaced by new ones, as would be the case in spring or summer when the plants are growing more vigorously, and no care that may be necessary to secure a steady bottom-heat of about 80° or 85° should be spared. Give air rather freely on bright days to plants ripening their fruit, and also to young stock in a growing state, and do not keep the latter so warm as to induce anything like weakly growth, or long thin foliage; but regulate the temperature according to the amount of light and the state of the plants. Where the temperature is maintained by means of dung linings, the plants must be kept very close to the glass and rather dry at the root, admitting air as freely as can be done without lowering the temperature too much, for there will be nothing gained by growing plants at this season as freely as it is possible to do in dung heat. Success in Pine growing is to some extent dependent upon having a supply of suitable soil, and fortunately this is not difficult to obtain in most neighbourhoods; but the best turf is greatly injured by being cut and carted in a wet state, therefore see to getting a good stock laid in before the ground gets saturated with wet. Vineries.—Attend to last week's directions as to protecting the borders from heavy rains, and whatever it may be purposed to do in this way should not be put off until the ground gets saturated with wet. Keep houses in which the fruit is ripe dry and cool, using gentle fires with a little air when the weather is damp, and also on cold nights. Be very sparing, however, in the use of fire heat after the Grapes are fairly ripe, as most varieties soon shrivel if kept too warm after they are ripe; but where the fruit is not yet ripe use brisk fires with a free circulation of air. Keep Vines in pots, where the object is to ripen the wood, rather dry at the root, with a rather warm dry atmosphere, and expose them to all the light possible; and where the wood is properly ripened get the plants pruned and remove them to a cool situation, but if out of doors see that the roots are protected from too much wet or frost. Young Vines planted this season that have made a fair amount of growth should be kept rather warm with a dry atmosphere, divesting them of all useless laterals, so as to get the canes thoroughly ripened, but such as may not be considered sufficiently strong, and are growing freely, may be encouraged with a moderately warm moist atmosphere for some time longer; but it must not be forgotten that small well ripened canes will break more strongly next season than large gross ill ripened ones. Peaches.—Keep as cool and dry as possible where the wood is ripe, and draw up the sashes at night when there is any appearance of rain, so as to prevent the inside borders getting saturated with wet. Also do what little pruning may be necessary as soon as the leaves are fairly off, and get the paint, &c., washed, and the house thoroughly cleaned, after which it may be used for sheltering plants where room is scarce; but be careful not to introduce anything that is infested with black thrips, for if this pest once gets into a house it is not easily got rid of. If any of the trees have to be replaced this should be done at once.

HARDY FRUIT AND KITCHEN GARDEN.

Attend to what fruit remains out of doors, looking over it frequently, and gathering it as it becomes fit, so as to prevent its being blown down and bruised by high winds. Keep the fruit-room cool and airy, and examine the fruit frequently and pick out any that are found to be decaying. Use every possible means to get the wood of Peach and Nectarine trees well ripened, and where the walls are flued a little fire heat should be applied until the leaves begin to fall freely. Also, if the trees are too thick of young wood every shoot that will not be wanted at nailing time should be cut out, so as to expose those left to all the light possible. Attend to former directions as to root pruning, and where this is required get it done at once. Root pruning, however, is not of much service where the subsoil is such that the roots can strike down into it, and where such is the case it will be better to lift overluxuriant trees and concrete the bottom of the border, as cutting the horizontal roots, although it might check the gross habit for a season, would not induce a fruitful habit. Clear off all crops that are done with, and get the ground manured and ridged up for the winter; also see that weeds are destroyed among growing crops, taking advantage of dry days for this work, and get every corner thoroughly cleaned, for the weather may soon be less favourable for this sort of work. Keep Celery rather closely earthed up, in order to prevent the plants getting injured by frost.

STATE OF THE WEATHER AT CHISWICK, NEAR LONDON.
For the week ending Oct. 11, 1855, as observed at the Horticultural Gardens.

Satur.	20	59.1	40.3	49.7	14	0.34	1	3	—	3	5	6	8	3

The highest temperature during the above period occurred on the 24th, 1845—therm. 76 deg.; and the lowest on the 19th, 1843, and 20th, 1842—therm. 22 deg.

Notices to Correspondents.

Acre: *D. Bowman.* Any book of Arithmetic will give you the information. An English acre consists of 4840 square yards.

Adulteration of Food: *P D.* The report to which you allude was confined to Chicory and Coffee. It was prepared for the use of the Excise officers and the Board of Excise, and has not been published.

Diseases: *G F.* It is a fungus called Æcidium laceratum, one of the most mischievous of all parasites. The White Thorn, the Pear, and the Service are most especially subject to its attacks, which occasionally destroy them. There is no known remedy. We should cut off the parts attacked and burn them. The seeds of the fungus are supposed to be taken up from the soil by the roots of the trees that are attacked.

Fruit Borders: *Inquirer.* We do not consider cropping fruit-tree borders with Strawberries a proof of good gardening—quite the contrary. Indeed many gardeners are against cropping them at all, but this we think is carrying the thing to the opposite extreme, as it is very rare that borders can be dispensed with. Provided they are well manured, Lettuces and similar dwarf crops may be grown without injury to the fruit trees, but in no case should vegetables of any description be sown or planted nearer than 4 feet from the stem. *B.*

Fruit Trees: *W C.* You will do well to select the six sorts of Pears you propose, for they are known to be good. The merits of the twelve others you mention have not been sufficiently ascertained in this country. ‖

Glass: *Henry.* The proper lap is always understood to equal the thickness of the glass and no more.

Insects: *R M.* We suppose (although your description is far too vague) that the caterpillars on your Cauliflowers are those of the large garden white butterfly. Hand-picking is the best remedy; a child will clear a bed in a couple of hours—*T L.* Your caterpillar is the common hop-dog, or larva of Bombyx (Dasychira) pudibunda.—*C F.* The grubs in your pasture are not those of the daddy-longlegs. They are the young larvæ of the common cockchafer. As they appear to be numerous, it would be well to turn up the infested spots and pick out the grubs; rolling the part will not be effectual. *W.*

Names of Fruits: *W G R.* Your Pear is the Marie Louise.—*Clapham, W.* 1, Beurré Diel; 2, 8, Passe Colmar; 3, 6, Marie Louise; 4, Glout Morceau; 5, Beurré de Capiaumont; 9, the Apple is Fearn's Pippin.—*W K.* 45 and 47 are of the Doyenné kind; probably both are the Doyenné blanc; 46 is an old French Pear, the Mansuette.‖

Names of Plants: We have been so often obliged to reluctantly decline naming heaps of dried or other plants, that we venture to request our correspondents to recollect that we never have or could have undertaken an unlimited duty of this kind. Young gardeners, to whom these remarks more especially apply, should bear in mind that, before applying to us for assistance, they should exhaust their other means of gaining information. We cannot save them the trouble of examining and thinking for themselves; nor would it be desirable if we could. All we can do is to *help* them—and that most willingly. It is now requested that, in future, not more than four plants may be sent us at one time.—*B H C.* See p. 648. Your initials were misread. It happened that two persons with the same initials received answers; but you were supposed to be *B H L.* You will find your answer at the place indicated. The plant is in a very succulent condition, and approaches A. angustifolia, although we believe it to be really referable to A. patula.—*F M C.* A Euonymus and apparently E. atropurpureus.—*E Y W.* Erica cinerea and Luzula sylvatica.

Nectarines: *Mary.* Your seedling proved very good; it much resembles the Violette Hâtive.‖

Plums: *E Pierce.* Your "seedling" is excellent; it may bear comparison with the Royale Hâtive or with the Purple Gage.‖

Pyroligneous Acid: *An Old Subscriber* will be much obliged to any of our correspondents who will state their opinion as to the distance from a dwelling-house in the country at which a manufacture of pyroligneous acid may be carried on without endangering the health or comfort of the family residing in that dwelling house.

Roses: *J W.* We are still of opinion that your Rose is a very tender kind, and that your climate is too cold for it. The only remedy therefore is replacing it with a hardier sort.‡

Rose Stocks: *M D.* Doubtless there is risk in removing Briar stocks, the buds of which have not begun to grow, because it is probable that the removal will give the stock a check, the result of which will certainly be to cause it to cast its bud. But if you can remove the stock without doing any thing to its roots to cause the spring growth to be checked, then the risk falls to 0.

Seeds: *Sub.* Vegetable and flower seeds imported from the continent are exempt from duty.‡

Misc: *J H.* Your seedling is very glossy and pretty, but of no merit. ‖

*** As usual, many communications have been received too late and others are detained till the necessary inquiries can be made. We must also beg the indulgence of those correspondents, the insertion of whose contributions is still delayed.

THE FOLLOWING MANURES are manufactured at Mr. Lawes' Factory, Deptford Creek:—Turnip Manure, 7*l.* per ton; Superphosphate of Lime, 7*l.*; Sulphuric Acid and Coprolites, 6*l.*—Office, 69, King William Street, City, London.

N.B. Genuine Peruvian Guano, guaranteed to contain 16 per cent. of ammonia. Nitrate of Soda, Sulphate of Ammonia, and other Chemical Manures.

THE LONDON MANURE COMPANY'S NITRO-PHOSPHATE OR WHEAT MANURE FOR AUTUMN SOWING.—This Manure, composed of blood, animal matter, and dissolved bones with silicates, is most strongly recommended to the notice of Agriculturists. It contains from 7 to 8 per cent. of nitrogen, in a form yielding ammonia by slow decomposition, and is therefore particularly adapted for Wheat. The quantity required is 2 to 3 cwt. pef acre drilled in with the seed. Price, per ton, 7*l.* 10*s.* in London.

PERUVIAN GUANO, FISHERY SALT, and every other MANURE on best terms, strictly warranted.

40, Bridge Street, Blackfriars. E. Purser, Sec.

ARTIFICIAL MANURES, &c.—Manufacturers and others engaged in making ARTIFICIAL MANURES may obtain every necessary instruction for their economical and efficient preparation, by applying to J. C. Nesbit, F.G.S., &c., Principal of the Agricultural and Chemical College, Kennington, London. Analyses of Soils, Guanos, Superphosphates of Lime, Coprolites, &c., and Assays of Gold, Silver, and other Minerals, are executed with accuracy and dispatch. Gentlemen desirous of receiving instructions in Chemical Analyses and Assaying, will find ample facility and accommodation at the College.

DRAINAGE OF LAND, BOGS, ETC.

MR. HUMBERT, of Watford, Herts, supported by unquestionable references and testimonials, offers his services to proprietors about to execute works of drainage, which he will undertake personally to lay out and superintend, and to supply the forms and attendances necessary to obtain the certificate of the Inclosure Commissioners at a fixed price per acre. Mr. Humbert (having been more than 15 years established in business as a Surveyor and Land Agent) has found that wet heavy soils can be usually carefully and thoroughly drained, with pipes 4 feet deep, and upwards, at from 4*l.* to 5*l.* per acre, inclusive of every expense.

LAND DRAINAGE.

MR. THOMAS SCOTT, Land Agent and Valuer, 5, Charing Cross, London, is prepared to undertake the Planning and Execution of LAND DRAINAGE in large or small quantities, by Contract or on Commission. He has now at work around London steady and well-organised "gangs," under competent Foremen and Pipe-layers.

Mr. Scott is at present carrying out extensive Drainage Works on Crown Lands, which he will be happy to show to Gentlemen desirous of seeing them. Communications addressed to him, as above, will be immediately attended to.—Oct. 13.

LAND DRAINAGE.

J. BAILEY DENTON, Engineer to the General Land Drainage Company, offers the following publications, which may be had by post (stamps being sent with the order) of W. P. Metchim, 20, Parliament Street, London.

1. LAND DRAINAGE AND DRAINAGE SYSTEMS. Second issue (1855), price 3*s.*

"The best practical treatise we have yet seen." *Agricultural Gazette.*—"A very able treatise." *Mark Lane Express.*

2. TABLES OF COST OF LABOUR AND MATERIALS. Price 1*s.* 6*d.* For the Pocket.

3. RELIEF OR SURFACE MODELLING, as Suggestive of Drainage and the Profitable Use of Drainage Waters. Second Edition (1850), price 3*s.* 6*d.* Medals (R. A. S. E., 1840, and Exhibition, 1851,) were awarded for this method of Modelling.

4. GENERAL DRAINAGE AND THE DISTRIBUTION OF WATERS; a Paper Reprinted from the "Westminster Review" (1842). Price 2*s.* 6*d.*

5. Also, THE DRAINER'S A LEVEL FOR THE USE OF WORKMEN. Price 30*s.*

Mr. Bailey Denton's engagements do not preclude him from Designing or Superintending the Drainage of Estates on terms to be ascertained of him at No. 52, Parliament Street, London.

THE GENERAL LAND DRAINAGE AND IMPROVEMENT COMPANY

Incorporated by Special Act of Parliament.
Offices, 52, Parliament Street, London.
Directors.
Henry Ker Seymer, Esq., M.P., *Chairman.*
Sir John V. Shelley, Bart., M.P., *Deputy-Chairman.*

George Thomas Clark, Esq.	William Fisher Hobbs, Esq.
John C. Cobbold, Esq., M.P.	Edward J. Hutchins, Esq., M.P.
Sir William Cubitt, F.R.S.	Sir S. M. Peto, Bart.
Henry Currie, Esq.	William Tite, Esq., F.R.S.
Thomas Edward Dicey, Esq.	William Wilshere, Esq.

Empowered to execute Drainage, Road-making, and other Land Improvements, and to Erect Farm Buildings upon Estates under Settlement, Mortgage, or otherwise; or Church property, and without investigation of Title to charge the whole outlay and expenses upon the Estate, to be repaid by instalments spread over any period determined by Landowners within the limits of 50 years for Drainage and Roads, and 31 years for Farm Buildings.

Landowners may arrange with the Company for the execution of the works by their own agents, with the use of their own or the Company's Capital. William Clifford, Sec.

THE LANDS IMPROVEMENT COMPANY.—Incorporated by Act of Parliament, 1852—53, for England and Scotland, and further empowered by Amendment Act, 1854—55. To Landowners, the Clergy, Solicitors, Estate Agents, Surveyors, &c., Tenants for Life, Trustees, Owners in Fee, Incumbents of Livings, Bodies Corporate; Lessees for Lives renewable, or for a term of more than 25 years; (and Lessees for Lives not renewable, or for a term less than 25 years, with consent of their Lessor), &c, are enabled, by way of Loan from the Company, or by their own funds, to execute and charge on the Lands improved, by way of rent-charge for a term of 25 years, repaying capital and interest, the cost of every landed improvement, especially of Drainage, Irrigation, Warping, Embanking from the Sea, from Lakes, Rivers, or Streams, Inclosing any Land, or improving Drains, Streams, or Water-courses, Reclamation, Farm Roads, Clearing, Erection of Farm-houses and other Buildings required for farm purposes, and the Improvement of and Additions to Farm Houses, and other Buildings for Farm purposes already erected; Planting for Shelter and for Periodical Cuttings, Jetties or Landing Places on the Sea Coast or on the banks of navigable Rivers or Lakes in the Highlands and Islands of Scotland; Engines and Machinery for Drainage, Engine-houses for Farm Steadings, &c., Water-wheels, Tanks, Pipes, Water-courses, Bridges, Sluices, &c. The Plans of Buildings, Specifications and estimates are prepared by the Applicant's own Agents and are submitted to the approval of the Inclosure Commissioners' Inspectors who are also the sole judges of the due execution of the works. Proprietors may apply jointly for the execution of Improvements mutually beneficial,—such as a common Outfall—Roads through the District—Water power, &c. The Directors wish it to be understood that the Company is of a strictly commercial character, and that the details of the Plans and of the execution of the Works are not interfered with by them, but are controlled by the Landowner and by the Inclosure Commissioners. For further information and for Forms of Application, apply to the Honourable William Napier, Managing Director, 2, Old Palace Yard Westminster.

SMITHFIELD CLUB, 1855.—FAT CATTLE SHOW.—The ANNUAL CHRISTMAS SHOW of FAT CATTLE, SHEEP, and PIGS, will take place on the 11th, 12th, 13th, and 14th of December, 1855, at the Carriage Bazaar, King Street, Portman Square, when nearly 800*l.* will be awarded in Prizes and Medals.

The printed forms of Certificates, properly filled up, must be returned to the Honorary Secretary on or before SATURDAY, November 10th. Prize Sheets and the necessary printed forms of Certificates are now ready, and can be obtained on application to B. T. Brandreth Gibbs, Honorary Secretary, Corner of Half-moon Street, Piccadilly, London.

All communications on the Club's business should bear the words "Smithfield Club" on the outside.

THE BIRMINGHAM CATTLE AND POULTRY SHOW, 1855.—The Seventh Great Annual Exhibition of CATTLE, SHEEP, PIGS, and DOMESTIC POULTRY, will be held in Bingley Hall, Birmingham, on TUESDAY, WEDNESDAY, THURSDAY, and FRIDAY, the 11th, 12th, 13th, and 14th of December next, when PRIZES will be awarded as follows:—

	£	s.	d.
CATTLE.—Including Two Extra Prizes of 20*l.* each and Two Gold Medals or other pieces of Plate of the value of 20*l.* each, for the best Ox or Steer, and the best Cow or Heifer	340	0	0
SHEEP.—First Prizes of 10*l.*, and Second Prizes of 5*l.*, for Leicesters, Long-Woolled Sheep not being Leicesters, South or other Down Sheep, Shropshire, and other Black or Grey-faced Short-Woolled Sheep—10 classes	150	0	0
PIGS.—Including Prizes for Pens of Breeding Pigs of a large and small breed	69	0	0
ROOTS.—Including a Silver Cup, value Five Guineas, for the best Collection of four different varieties	27	6	0
POULTRY.—Including Nine Silver Cups, of the value of Ten Guineas each, for the best Pen of Pencilled Hamburgh, Spangled Hamburgh, Polish, Spanish, Dorking, Cochin China, Game and Gold, or Silver Bantams; and for the best four Pens of Pigeons, to be exhibited, especially for this prize	451	10	0
	£1037	16	0

Exclusive of Silver Medals to the Breeders of Cattle, Sheep, and Pigs, and Prizes in the Extra Classes and for Cottagers' Poultry.

Mr. Ottley has also offered a Gold Medal, of the value of Ten Guineas, as an extra prize, for the best Pen of Polish Fowl of any colour, to be selected from the several classes for this variety.

Prize Lists, Certificates of Entry, and any further information may be obtained from the Secretary. The Entries close on Saturday, Nov. 10. John Morgan, Jun., Sec.

Offices—38, Bennett's Hill, Birmingham.

COLLEGE OF AGRICULTURE AND CHEMISTRY, AND OF PRACTICAL and GENERAL SCIENCE, 37 and Lower Kennington Lane, Kennington, near London.

Principal—J. C. Nesbit, F.G.S., F.C.S., &c.

The system of studies pursued in the College comprises every branch requisite to prepare youth for the pursuits of Agriculture, Engineering, Mining, Manufactures, and the Arts; for the Naval and Military Services, and for the Universities.

Analyses and Assays of every description are promptly and accurately executed at the College. The terms and other particulars may be had on application to the Principal.

PRUNING.

THE GRECIAN PRUNING SAWS are universally acknowledged to be the best for every description of Pruning. They cut faster and cleaner than any other, and do not bend or break. Price 2*s.* 6*d.*, 3*s.*, and 3*s.* 6*d.* each.

Thomas Hill, late W. Coleman, Cutler, 4, Haymarket, London.

HOSE PIPING.

WAITHMAN'S PATENT FLAX HOSE PIPING will sustain a greater pressure, is lighter, less bulky, will wear longer, and is about 60 per cent. cheaper than the leather hose pipe.

Manufactured only by Waithman & Co., Bentham, Lancaster.

No. 1 Quality, Inches in Diameter and Price Per Yard:—½, 9*d.*; ¾, 11*d.*; 1, 1*s.* 1*d.*; 1¼, 1*s.* 3*d*; 1½, 1*s.* 5*d.*; 1¾, 1*s.* 7*d.*; 2, 1*s.* 9*d.*; 2¼, 2*s.*; 2½, 2*s.* 3*d.*; 2¾, 2*s.* 6*d.*; 3, 2*s.* 9*d.*

Super Extra Stout Quality:—2, 2*s.*; 2¼, 2*s.* 3*d.*; 2½, 2*s.* 6*d.*; 2¾, 2*s.* 9*d.*; 3, 3*s.*

No. 0, a cheaper Hose, to bear a low pressure for Garden and Agricultural purposes, at greatly reduced prices:—1, 9*d.*; 1¼, 10*d.* 1½, 11*d.*; 2, 1*s.*; 2¼, 1*s.* 3*d.*; 2½, 1*s.* 6*d.*

The Hose is Burnettised at an extra charge of 3*d.* per yard.

Union Joints, Branch Pipes, and Jets are also supplied.

"FRIGI DOMO."—Patronised by her Majesty the Queen, the Duke of Northumberland for Syon House, his Grace the Duke of Devonshire for Chiswick Gardens, Professor Lindley for the Horticultural Society, Sir Joseph Paxton for the Crystal Palace, Royal Zoological Society, late Mrs. Lawrence, of Ealing Park, and — Collier, Esq., of Dartford.

PROTECTION FROM MORNING FROST.

"FRIGI DOMO," a Canvas made of patent prepared Hair and Wool, a perfect non-conductor of Heat and Cold, keeping, wherever it is applied, a fixed temperature. It is adapted for all horticultural and floricultural purposes, for preserving Fruits and Flowers from the scorching rays of the sun, from wind, from attacks of insects and from morning frosts. To be had in any required length, 2 yards wide, at 1*s.* 6*d.* per yard run, of Elisha Thomas Archer, whole and sole manufacturer, 7, Trinity Lane, Cannon Street, City, and the Royal Mills, Wandsworth, Surrey; and of all Nurserymen and Seedsmen throughout the kingdom. "It is much cheaper than mats as a covering."

LIGHT, CHEAP, and DURABLE ROOFING.—CROGGON'S PATENT ASPHALTE ROOFING FELT is perfectly impervious to rain, snow, and frost, and has been tested by a long and extensive experience in all climates. Saves half the timber required for slates. Can be laid on with great facility by farm servants or unpractised persons. Price 1*d.* per square foot. Croggon's Patent Non-conducting Felt, for covering steam boilers and pipes, saves 25 per cent of fuel. Samples and testimonials sent by post, on application to Croggon & Co., 2, Dowgate Hill, London, who also supply ship-sheathing felt and inodorous felt, for damp walls, and lining iron houses, and roofs generally, to equalise the temperature.

WATERPROOF PATHS.
BARN AND CATTLE SHED FLOORS.

THOSE who would enjoy their Gardens during the winter months should construct their walks of PORTLAND CEMENT CONCRETE, which are formed thus:—Screen the gravel of which the path is at present made from the loam which is mixed with it, and to every part of clean gravel add one of sharp river sand. To five parts of such equal mixture add one of Portland Cement, and incorporate the whole well in the dry state before applying the water. It may then be laid on 2 inches thick. Any labourer can mix and spread it. No tool is required beyond the spade, and in 48 hours it becomes as hard as a rock. Vegetation cannot grow through or upon it, and it resists the action of the severest frost. It is necessary, as water does not soak through it, to give a fall from the middle of the path towards the sides.

The same preparation makes first-rate paving for BARNS, CATTLE-SHEDS, FARM-YARDS, and all other situations where a clean, hard bottom is a desideratum. May be laid in winter equally well as in summer.

Manufacturers of the Cement, J. B. White & Brothers, Millbank Street, Westminster.

FIRST PRIZE REAPING MACHINE.
NOTICE.

MESSRS. BURGESS AND KEY beg respectfully to inform the public, and particularly the noblemen and gentlemen whose orders they were obliged to decline for this season on account of the manufacture not being fully arranged, that the Royal Agricultural Society's First Prize of 30*l.* was awarded to them for M'Cormick's Reaper, with their patent screw platform, at the trial at Leigh Court, near Bristol, upon the 29th of August last. Amongst the competing machines were Bell's, by Crosskill; Forbush's, exhibited by Mr. Palmer; and Hussey's, with tilting platform, by Wm. Dray & Co. The reports of farmers who have worked the machines during this present harvest, show that the average quantity of Wheat, Barley, and Oats which they cut was from 1¼ to 1½ acre per hour. Two horses work the machine with ease, and the only attendant required is a man or a boy to drive. Further particulars and prices sent free on application.—Burgess & Key, 103, Newgate Street; and 52, Little Britain, London.

CAUTION.

PARKES' STEEL DIGGING FORKS AND DRAINING TOOLS.

Whereas very inferior descriptions of Steel Digging Forks are now manufactured and sold, and I have been informed that purchasers of the same have believed them to be the same as those manufactured by me, and to which the Royal Agricultural Society and numerous Agricultural Societies' prizes have been awarded, I hereby respectfully inform the public that every Fork manufactured by me is stamped with my trade mark "J. P.," and that Messrs. Burgess & Key, of No. 103, Newgate Street, London, are my sole Wholesale Agents, and I have authorised them to replace to the purchaser every Fork of my manufacture found defective; they will also on application send Wholesale and Retail Price Lists, &c., post free. Francis Parkes & Co.

PAXTON WORKS, SHEFFIELD.

SAYNOR AND COOKE, Manufacturers of the celebrated Exhibition Prize PRUNING, BUDDING, and GRAFTING KNIVES, VINE and PRUNING SCISSORS, &c. These articles are Warranted to stand any kind of work, and to carry the keen edge of a razor without requiring to be sharpened so frequently as is usually necessary to obtain that sharp edge so requisite for the comfort and use of the practical gardener. The blades are also warranted to wear through to the back. They are used by all the eminent gardeners in England, Ireland, and Scotland, and can be purchased of any nurseryman or seedsman in the three kingdoms. Those who may not have used them are respectfully solicited to give them a trial. The Great Exhibition Prize Medal of 1851, and the Prize Medal of the Horticultural Society of Manchester, at their Show of 1854, was awarded to Saynor & Cooke for their superiority of material and workmanship. Established 1738.

CARSON'S ORIGINAL ANTI-CORROSION PAINT, specially patronised by the British and other Governments, the Hon. East India Company, the principal Dock Companies, most public bodies, and by the nobility, gentry, and clergy, for out-door work at their country seats. The Anti-Corrosion is particularly recommended as the most durable out-door Paint ever invented, for the preservation of every description of Iron, Wood, Stone, Brick, Compo, Cement, &c., work, as has been proved by the practical test of upwards of 60 years, and by the numerous (between 500 and 600) testimonials in its favour, and which, from the rank and station in society of those who have given them, have never yet been equalled by anything of the kind hitherto brought before the public notice.

Lists of colours, prices, together with a copy of the testimonials, will be sent on application to Walter Carson & Son, 9, Great Winchester Street, Old Broad Street, Royal Exchange, London. No Agents. All orders are particularly requested to be sent direct.

The Agricultural Gazette.

SATURDAY, OCTOBER 13, 1855.

In a former paper on Irrigation we just glanced at some of the requisites for the due performance of the process, the principal of which were—1st, A command of water which could be readily directed, not *upon*—as is generally supposed, like flooding from a swollen river—but *through* every part of the field; 2dly, A slow and steady drainage off the meadow, so that in no part should the water ever stagnate.

Now without entering at any length into the consideration of the best means by which the first end can be secured, it may be remarked that economy of space occupied by the water conduits is a very important matter, not only as a saving of land. In a country like ours where water rights are so important, and water indeed by no means a constant quantity, the large and deep feeders too often used are exceedingly objectionable, inasmuch as they too frequently defeat their own intention, as in dry seasons a whole series of meadows are unvisited by water just in the time of their greatest need of this element, awaiting the filling up of deep canals, until which they must remain inactive, the water becoming meanwhile injured by stagnation. It must not be considered that irrigated meadows may be good without drainage; a perfect drainage should be secured, where it is not insured by the structure of the substratum, by as perfect a system as would be pursued in ordinary good cultivation. Indeed, a water meadow should in a few days after the water has ceased flowing on to it be as dry as ordinary well-conditioned pasture, not only in parts but as a whole, and any slight deviation from this rule should at once be rectified by the overseer of the works, or as he is called in the Gloucestershire vernacular, the "drowner." It is his duty to attend to any imperfections arising from want of fresh conduits, obstruction to the older ones, and the like; and should he neglect his duty, or if from various causes, either the newness of the works or the inaptitude of the ground for carrying them out, bad results should arise, these will at once make themselves known to the experienced eye, and more especially during the summer, as the

herbage in its varying quantity and quality in different parts of the field will, by the abundance of one form of plant here, and the scantiness of another there, point out not only extremes of good and bad quality, but every degree of it, for where the herbage may be made up of 30 different species of plants, each one with peculiar idiosyncracies, the fact of any of these monopolising a certain space, and the proportions in which they mix become as important when the species themselves are studied, as, in the estimation of society, is an analysis of the habits of its different members.

If we contrast a survey of a good irrigated meadow in mowing Grass with a bad one, we shall at once see the significance of the foregoing remarks. A meadow in good condition will contain abundance of such Grasses as are of known nutritive quality—"sweet Grass;" and though the botanist may detect here and there a stray specimen of an opposite description, yet these usually look as sickly and unhealthy as do the better kinds in bad soil and circumstances; for it must ever be borne in mind that Grasses like other plants, if designed for poor soil, do as badly in richer ones as do those that require good land in that of a poorer quality. If, therefore, we see a field of Grass the bulk of which is composed, pretty evenly mixed, of—

Lolium perenne, Rye-grass
Poa pratensis, Smooth-stalked meadow Grass
Festuca pratensis, Meadow Fescue
" " *var. loliacea*, Spiked Meadow Fescue
" *duriuscula*, Hard Fescue
Dactylis glomerata, Cock's-foot
Agrostis stolonifera, Creeping Bent

we may from these judge the irrigation process to be properly carried out.

On the other hand, when we observe either over the whole field or in patches here and there bad kinds, "sour Grasses," to be the rule, and good specimens in a starving state the exception, we may be quite sure that the meadow, either as a whole or in part, is in an imperfect state. And the Grasses which best point this out are the following:—

Aira cæspitosa, Hassock Grass
Poa trivialis, Rough-stalked Meadow Grass.

These with the different species of Sedge (Carex), indicate a want of drainage.

Avena pratensis, Meadow Oat Grass
Briza media.

These point out a poor clayey subsoil, a "hungry clay."

Holcus lanatus
Arrhenatherum avenaceum, Oat-like Grass
Bromus mollis (its varieties), Soft Brome Grass,

at once lead to the inference of a poor soil not of a stiff description.

From the foregoing remarks, then, it would appear that irrigated meadows vary much in quality, which variation, though it depends greatly on the land is perhaps but little due to the water, but is principally owing to the perfection of the irrigating processes and to the subsequent management, and therefore the following epitome of the method of using an irrigated meadow, on the borders of which we lived for some time, and the observation of which gave us great pleasure, is added as an illustration of the use and value of irrigated meadows. For this we are indebted to the kindness of Robert Anderson, Esq., agent to the Earl Bathurst.

"In the field of about 9 acres we begin flooding in the early part of October, and continue it perhaps once a week, or as often as we can get water, till the end of March. The meadow is then kept dry for sheep, which are put upon it about the middle of April, namely, 300 ewes and their lambs. These sheep are folded at *night*, upon Italian Rye-grass, on the farm about half a mile from the meadow; they continue this course for about five weeks; after they have left, we flood the meadow once or so again if the water will admit, and save it up for mowing. The hay crop averages from 25 to 30 cwt. to the acre.

"Immediately after the hay is carted off we flood again if possible, so as to get a good lattermath for the fattening oxen, ten of which graze it from about the beginning to the end of August. In about a week or 10 days afterwards 100 ewes with the ram are put in, and it keeps them about three weeks. This brings it to October, when the same course is recommenced.

"The labour is about 10*s.* an acre, including the repair of hatches. Our meadows are all now in hand, but when they were let the rent was 5*l.* an acre. It may be well to add that, not having the command of water, flooding cannot always be used to the desired extent."

This description of the management of a single irrigated meadow is sufficient to show us the value of the system, for it not only affords early keep for the ewes and lambs in a district proverbially late, but year after year yields a good crop of hay whilst the un-irrigated meadows in the same district will scarcely afford a ton of hay to the acre every other year, and for this they must be shut up very early in the spring.

PROFITS OF AGRICULTURE.

The increased profits to be made by high farming must be little understood, seeing how small is the portion of the land in cultivation that is being benefited in this way. The feeling is far too general that artificials do not pay, and in this term are comprehended all purchased food and manures, high feeding, hoeing, and extra cultivation. The Leicester Agricultural Society has for several years been enabled by the liberality of Mr. Packe, the county member of Parliament, to offer three prizes, in classes, to the tenants of the three best cultivated farms within 15 miles of Leicester, viz., 30*l.* to the tenant of over 200 acres, 15*l.* of from 120 to 200 acres, and 10*l.* of from 80 to 120 acres. This year there were thirteen farms entered, and seeing how successful is the farming that has been brought to my notice in acting as the judge to award the prizes, and how much of this success must be attributed to the high farming, I am induced to give some details of the cultivation, dressing, cropping, and working of the three farms to which the prizes have been awarded.

The first prize is awarded to Mr. J. N. Gimson, of Ibstock, Ashby de la Zouch, occupying 252 acres, of which 104 acres are in permanent Grass, and 148 are arable. The cropping the last year was as follows, viz.:—

Wheat after Oats	22 acres.
Oats after seeds	29 "
Barley after Turnips	28 "
Peas, early, followed by Turnips	12 "
Tares followed by Turnips	5 "
Seeds, mixed	28 "
Ditto, laid down permanent	12 "
Swedes after fallow	12 "
	148
Turnips after Peas and Tares	17

The enriching food and dressing bought, viz.:—

Cake	Tons 7
Malt dust	" 2 2
Linseed	Bush. 8
Lime	Tons 17½

The stock kept, viz.:—

Beasts, stall	30
Ditto, fatted	40
Sheep, ewes	100
Ditto, lambs	126
Ditto, rams	2
Ditto, fatted	80
Horses, working	6
Ditto, others	3
Pigs	15

The system has been to drill the Wheat, Peas, and root crops, and to both hand and horse hoe them. On the weaker land to take one white and one green crop alternately, viz., Oats, Swedes, Barley, and seeds, the seeds being mown for fodder and then broken up for Turnips, having a dressing of bones or guano, and the Turnips being eaten off with sheep, having a little cake. On the deeper soiled, to take Wheat after Oats, giving the Oat stubble a good dressing of lime and bones. The whole of the beasts were wintered in yards and sheds. Twenty-two were fatted in sheds on Swedes, Linseed, Rape-cake, Barley, and Oatmeal, with hay and straw cut and whole, the chaff being moistened with boiled Linseed. These were sold fat the 12th of May. Eighteen were fed in open yards and sheds on Swedes, Barley-meal, Rape-cake, hay and straw, until put on Grass, when they continued to have Barley-meal. These were sold fat the 26th June. The store beasts were kept in winter on straw and Swedes, with some hay and straw chaff mixed with a small quantity of malt, dust, and Rape-cake.

The second prize is awarded to Mr. Ralph Arnold, of Shackerstone, occupying 185 acres, of which 106 are in permanent Grass and 79 acres are arable. His cropping the last year was as follows, viz.:—

Wheat after Peas, Beans, and Oats	12 acres.
Oats after two years lea	9 "
Barley after Turnips	20 "
Seeds, one year lea	13 "
Ditto, two ditto	9 "
Swedes	10½ "
Turnips	4 "
Cabbage	1 "
Potatoes	½ "
	79

The enriching food and dressing bought, viz.:—

Cake	Tons 3
Manure	Loads 25
Guano	Tons ½
Lime	" 30

The stock kept, viz.:—

Milch cows	28
Beasts	10
Ditto yearlings	3
Calves	3
Sheep	108
Lambs	75
Horses, working	4
Pigs	—

The system has been to drill the Wheat and roots, to hand-hoe and weed the drilled corn, and to both horse and hand-hoe the roots. Nearly the whole of the straw consumed by the stock is cut and given mixed with hay, Turnips, ground Oats, Peas and oil-cake; a few beasts are fattened in the winter upon cut Swedes and oil-cake; the lambs are fed upon Turnips with malt dust and a few Peas; the manure is made by the beasts being kept in sheds in winter.

The third prize is awarded to Mr. Barnaby Pickering of Sharnford, occupying 80 acres, of which 42 acres are in permanent Grass, and 38 acres are arable. His cropping the last year was as follows, viz.:—

Wheat after Oats	5 acres
" after lea of 1 year	4 "
Oats after lea of 2 years	4 "
" after Turnips	3 "
Barley after Turnips	4 "
Peas early following Turnips	2 "
Seeds early following 1 year lea	6 "
" early following 2 years lea	4 "
" grazed till June, and then broken up for Turnips	4 "
Turnips after fallow	2 "
	38 "
" after seeds broken up in June	4 "
" after early Peas	2 "

The enriching food and dressing bought, viz., town manure and guano to the amount of 20*l.* The stock kept, viz.:—

Milch cows	16
Stirks	4
Calves	4
Bull	1
Ewes	30
Lambs	30
Pigs	—
Working horses	3

The system has been to drill the Wheat, Barley, Peas, and roots; to hand-hoe the drilled corn, and to both hand and horse-hoe the Peas and roots. He annually fattens about 30 teggs, and from 20 to 30 ewes, part raised and part purchased, and sometimes to feed; two or three cows in stalls upon hay and Turnips, with a little corn or cake. The manure made on the farm is from wintering the cattle in yards, and giving them the produce of the farm with a little corn and oil-cake.

On each of these farms some extent of draining has been done by the tenants at their own cost (in two instances only were the pipes found them), and there was a general evidence of attention to maintaining the premises and fences in good condition. The land was very clean, and all the crops were very large and without any failure, and the returns both of stock and corn with reference to the extent of the farms will be seen to considerably exceed what is usual. The land is considered to be naturally very good, and is proportionately high rented, but to what extent its superior fertility may be owing to the cultivation and high feeding it receives it is impossible to say, but contrasting the superior treatment it has received for ages to that which is generally given, one need not attribute great natural fertility to it to account for the larger returns. By many their land is thought to be too poor to warrant such outlay, and by others not to call for it, and it is to the attention of these that I particularly recommend these details.

I may take this opportunity of saying a word or two in favour of such prizes as these: they not only excite individual exertion with a view to gaining a prize, but they create a spirit of rivalry and draw attention to the best cultivated farms in the district, and in so doing offer examples to others to copy from. *Hewitt Davis*, 3, *Frederick's Place, Old Jewry, London, Oct.* 1, 1855.

ON SOME POINTS CONNECTED WITH AGRICULTURAL CHEMISTRY.

By J. B. Lawes, F.R.S., & Dr. J. H. Gilbert, F.C.S.

(*Concluded from p.* 667).

They next called attention to the analysis of three actual rotations, the course in each case being Turnips, Barley, Clover, Wheat. In one instance the rotation commencing without manure, in the second with superphosphate of lime alone, and in the third with a mixed and pretty full manuring. It appeared that in each case the Clover grown between the Barley and the Wheat (the intervention of which instead of the immediate succession of the Wheat would greatly increase the produce of the latter) removed from the land very much more of phosphoric acid, of potass, of lime, and of magnesia—in fact of every important mineral constituent except silica—than either the preceding Barley or the succeeding Wheat. Hence it was maintained that the effect of this leguminous crop in rotation as a preparation for Wheat could not be, according to the theory of Baron Liebig, to increase the available supply of, or to conserve within the soil, the important mineral constituents of the crop. Unless indeed in the case of silica, which however Baron Liebig had himself maintained would never be wanting in sufficient quantity in any soil, provided there were a sufficiency of available alkalies present. Taking these facts, together with those indicating the most important manuring for the cereals, as well as with others relating to the composition and known circumstances of growth of the leguminous crops, it could only be concluded that the Clover had accumulated from the atmosphere within the soil a supply of available nitrogen to a great extent exhausted by the growth of the previous cereal—Barley, and so essential for the succeeding cereal—Wheat.

Finally, attention was called to the fact, that but a comparatively small proportion of the nitrogen supplied in manure for the growth of the cereals was recovered in the increase produced. They showed by a table that the loss of nitrogen was greater or less according to the amount of it supplied in manure, and to the conditions favourable or otherwise as to mineral supply, character of the season, &c. Under the most favourable supplied conditions—that is with a full supply of minerals and a limited supply of nitrogen, they had only recovered in the increase about half the nitrogen contained in the manure; but when nitrogen was supplied in quantity

sufficient to yield a full crop for any given season, they had obtained little more than one-third of the supplied nitrogen in the increase: and inasmuch as when the amount of nitrogen employed was not very great, the one-half or two-thirds which was not recovered in the increase obtained in the year of the application of the manure, had little or no effect on the next crop, it could not be supposed that the bulk of this excess of nitrogen still remained within the soil. It was worthy of remark that vegetable physiologists had frequently observed the evolution of nitrogen from the leaves of plants during their growth, beyond that which was due to the atmosphere with which they had been supplied. But as it had not yet been satisfactorily demonstrated that the cereals gave off more nitrogen in this way than the leguminous crops of rotation, further experiment was needed before the loss in question, and consequently the varying characters in this respect of the different plants in rotation could with full confidence be explained by reference to the functional action in question. The only explanation which had been suggested as special to the cereals was that proposed by Mr. Way—viz., that the silica required by these plants is taken up as a silicate of which ammonia is a base, and that this alkali or its constituents is evolved upon the fixation of the silica within the plant. It was, however, to say the least, not very favourable to this view, that the authors had found that water containing salts of ammonia dissolved less silica than pure water when percolated through a given bulk of soil. It must be admitted, however, that although the explanation of this loss of nitrogen with the cereals might require further investigation, which the authors had hoped to devote to it; yet, as in the case of other crops they had recovered in a series of years a much larger proportion of the supplied nitrogen, they considered that the loss in question could not be wholly due either to drainage of soluble or the evaporation of volatile compounds of nitrogen. But, that the fact of a considerable loss in the production of a full crop of the cereal grains must be looked upon as an important and fundamental item in studying the *rationale* of agricultural practices.

Upon the whole, they concluded:—

1. That the manure indicated by the resultant requirements of British agriculture has no direct connection with the composition of the mineral substances collectively found in the ashes of the produce grown on, or exported from the farm—and that the direct mineral manures which are required, are not advantageously applied for the direct reproduction of the exportable corn; but should be used for the green or fallow crops, the office of which it is to collect from the atmosphere, or to conserve on the farm, nitrogen for the increased growth of the saleable cereal grains.

2. That the nitrogen required to be provided within the soil for this purpose is far greater than that contained in the increase of produce obtained by it.

3. That the effects of fallow in increasing the growth of the saleable cereal grains (so far as they are chemical), are not measurable by the amount of the additional mineral food of plants liberated thereby, these being under ordinary cultivation in excess of the assimilable nitrogen existing in, or condensed within the soil in the same period of time, the amount of which latter, therefore—the available nitrogen—is the measure of the increased produce of corn, which will be obtained.

4. That the beneficial effects of rotation in increasing the production of saleable produce (so far as they are chemical), are not dependent on the fact of one plant taking from the soil more of the different mineral constituents than another, but on the property of the so-called green or fallow crops bringing on or conserving upon the farm more nitrogen than is yielded to them in manure, whilst the crops to which they are subservient are both largely exported from the farm, and yield in their increase considerably less of nitrogen than is given to them in manure.

5. In a word, that in the existing condition of British agriculture a full production of the saleable cereal grains, with at the same time other exportable produce, is only attained, whether by manures, fallow, or rotation, by an accumulation of available nitrogen (normally an atmospheric constituent) within the soil itself.

A lengthened discussion followed the reading of the paper, in which Baron Liebig, the Marquis of Tweeddale, Professor Anderson, Dr. Daubeny, and Mr. Russell, took part, after which Dr. Gilbert replied.

LANDLORD AND TENANT.

[The following letter is addressed to — Gale, Esq., in reference to the address on this subject delivered by him at a meeting last year of the Botley Farmers' Club.]

For a number of years my mind has been made up that the first thing necessary to good farming is a proper agreement betwixt landlord and tenant. In the *Gardeners' Chronicle* of the 14th of February, and again on the 5th of May last, I read with much pleasure the extracts of your address delivered to the Botley Farmers' Club, and with what you suggested at those meetings I agree on many points, and now venture to submit my humble ideas on the subject. As it is now taken up by so high an advocate, I do hope much good will result from your labours.

I believe such an agreement can be framed as will produce good farming, security to the landlord, and keep him and his tenants out of litigation. This can be done by the presentation of a proper agreement by the landlord or his agent at the time he wishes to let a farm. I will confine my remarks to the circumstances of the farm I now occupy, 387 acres of arable, 58 acres of Grass land, the tillage land to be farmed on the four course system, Grass land not to be broken up without a special agreement, or subject to a penalty. If more is required by the landlord to be laid down to permanent Grass, a compensation to be made or longer tenure granted—this is my agreement.

Where the farm requires only a moderate outlay for improvements, a term of 21 years I consider a fair base; but where there is a large outlay required, and that to be done at the tenant's expense, an additional term ought to be allowed in proportion to the extent of the improvement required, where it is practicable.

In this neighbourhood it would, I think, be necessary to alter the day of quittance of the homestead, and one or two pieces of Grass land, from the 25th of March to the first of May, in order to give time to more fully consume the green crops, fodder, and dispose of fat stock, shutting up the young Clover on 1st November, and all the Grass land, except the one or two fields to be given up on the 25th March.

The letting agreement should require all off-going tenants, after the harvest of the last year of their tenantry, to plough, scuffle, or work by broad-share all land required for Turnips or other green crops, to do all winter ploughing, put the fences in good repair at a proper time of year, plough and sow all the spring corn, supply all kinds of seed at his own expense, prepare the Turnip land, get manure out for Turnips and other green crops, have roads, gates, and stoops[?] left in good repair, the landlord supplying stoops and sawn timber for gates, the whole of the Grass land, tillage land, house, and buildings to be given up to the new tenant, and the expenses of the outgoing tenant to cease on the 1st May.

It shall be imperatively the duty of the new tenant to conduct the management of the farm from the time of his entry to the end of the harvest upon the rules of good husbandry. And as a compensation for all this work that has been done by the off-going tenant, and what is called a tenant right and custom of the country, I propose to introduce into the letting agreement an arbitration clause, each of the tenants to choose an arbitrator, they an umpire; the three gentlemen shall go over the farm in some of the first ten days in May, value hay, straw, and manure at a consuming price, the work done, and the condition of the farm to the first of May, by the off-going tenant, it being strictly his duty not to neglect the proper time of planting Potatoes, sowing Mangolds, if in his district it is customary to sow them before the 1st of May; take down their remarks in a book, and sign the same.

At the second meeting, after the corn is shot, the arbitrators shall with great care inspect the evidence taken in the book, examine the Potatoes, Mangolds, and Turnips, fix a value for seed, manure, and all labour that has been expended on all the green crop land, from the last harvest up to the 1st of May, fix a value on the corn crops. The whole amount to be divided in three parts, and in every case shall each tenant be entitled to one-third of the valuation, and according to the good or bad farming of the off-going tenant in his last year, shall the arbitrators have the power to divide, as they think proper, all or any portion of the undivided one-third, to each or either of the late or present tenant.

In the event of either of the tenants being dissatisfied with the award, I would give them a right of a final appeal; let the dissenting party or parties, within four days after the award has been given in, give notice in writing to the arbitrators of his or their dissent, when the arbitrators shall request a magistrate not living within 12 miles of the farm in question to send two respectable farmers that have occupied land of similar quality, or land that they have worked on the four-course system, as arbitrators, and with the three proceed to view the condition of the farm, taking as evidence the contents of the May book signed at the first meeting by the three arbitrators, and agree upon an amount of valuation.

The five arbitrators shall be the final jury, to give to each, or to one only, the whole or any part of the undivided one-third portion of valuation that each tenant by this agreement is entitled to.

The expenditure on roads, fences, and gates not to be valued, and if found in bad condition an amount to be fixed sufficient to put them in fair tenantable repair, and deduct that amount from the sum that shall by this arbitrators' agreement be awarded to the off-going tenant or his or her representatives. And as a compensation to the arbitrators, 10*l.* each shall be paid to either three or five, whichever may have been employed, by the two tenants in proportion to the amount each one shall be awarded. The incoming tenant at the 10th of May shall pay to the outgoing tenant a sum of money to be fixed by the arbitrators, an amount equal to what they suppose he has spent on the farm, from the conclusion of his harvest the previous year to the 1st of May, the balance by two equal instalments, the one on the 1st of October, the second and equal last part to be paid on the 1st of December in the year of his entry.

Hoping from this you will work out something that will be of benefit to the labourer, the tenant, and secure to the landlord his rent by good farming. *J. C. Etches, Harly Thorn Stone, Staffordshire, Oct. 3.*

Home Correspondence.

Fisken's Plough.—Your captious and rather unintelligible correspondent "W. B., London," charges me with "a serious mistake" for saying that "Fisken's plough lessens the strain upon the anchorages." Strictly speaking, I never said anything of the sort. In an article in the *Agricultural Gazette*, No. 34, I endeavoured to show how Mr. Fisken has succeeded in "lessening the strain," or (in more correct phrase), in working with a less strain upon the anchors than any one else has ever worked with. If I have "failed in making good my bold announcement," it is not because I am "unable to comprehend the facts of the case," but because in studying conciseness of expression, I may have failed to give a clear description of Fisken's invention. As to "re-action" urging forward Usher's plough, and "rotatory action and continuous progression" being a mistake, I can only say that, although I may not have employed the term "re-action" in its strict sense, yet that the machine certainly propels itself forward without any further power than is exerted in thrusting the tools into and through the ground. Has "W. B." travelled by a steam-boat? Well: Usher's rotary plough is like a paddle-wheel acting upon land, stirring up the soil, and by so doing, causing the carriage which supports it to move forward. *I. A. C.*

Beans for Horses.—There can be no danger in using new Beans not hardened in the stack; kiln-drying would enable them to be crushed; 4 bushels of Beans uncrushed will nearly increase to 6 bushels when crushed; and crushed Beans—say half a peck to three-quarters per day, soaked in water and given with cut hay, will keep a horse in excellent condition, will be equal to a peck or more of Oats, but boiled Beans will beat the whole for the nutriment furnished to the horse. The grooms of entire horses are very fond of giving a feed of boiled Beans with malt after a long journey. It is their prime feed; also flour of Wheat mixed with water (5 or 6 lbs.), and drank like milk by the horse, will make them hog fat in a short time, although the Wheat itself whole would half-kill them, and causing them to shed their hoofs from inflammation attacking the sensible lamina of the foot. In fact, a translation of the disease, produced in the animal's stomach, to the feet, and which in an instance that came under my own observation in a mare of my own was the saving of the mare's life. The hoofs were reproduced after a lapse of 6 or 8 months, but the mare never recovered her former good plight. Boiled Beans are excellent food for a horse that has tender or irritable bowels and liable to purging when put to work. *A Constant Reader.*

The Sunflower.—I have read some remarks in your Paper of last week relative to the Everlasting Pea, and I should be glad to see the attention of your correspondents directed to the Sunflower, which appears to me to deserve more notice than it receives. Johnson, in his "Cottage Gardeners' Dictionary," has the following: "The Sunflower is now much cultivated for its oil, and as a food for cattle and poultry. One acre will produce 50 gallons of oil, and 1500 lbs. of oilcake. The stalks when burnt for alkali give 10 cwt. of potash. Now, in these days, when Linseed and oil-cake are so enormously advanced, might not the Sun-flower come in as a substitute? In Hungary it is grown as a regular crop; it is easy of cultivation, and thrives in our climate. I have now some plants before my window bearing each eight or ten flower heads, and some of the heads containing above 200 grains. *Tonbridgiensis.*

Suggestions for Agricultural Statistics.—1. The report of the Lords' committee is in favour of employing the Poor-law Board for their collection, but we see no sound reason for troubling the Poor-law officials, as, if the returns are made compulsory there would be no occasion to trouble the guardians of the union. Nor is it desirable that the relieving officer of the union should be diverted from his ordinary duties, which as a general result give him full employment. For instance, in the Hemel Hempsted Union, comprised of five large parishes, with an area of 25,000 acres, the relieving officer has weekly to call upon 200 different poor persons to distribute relief, living in widely separated parishes. 2. We are of opinion that the collection of the returns should be made by the local officers of each parish, either through the collector of the poor rates, or by the collector of assessed taxes, who is not the assessor of taxes but a permanent parish officer, who is in the habit of sending out schedules to every occupier of land. The Board of Trade to have the option of either one or the other of such officials. 4. We consider it highly desirable that the returns shall be re-delivered by the occupier at the residence of the collector, on or before the expiration of the 14 days allowed for their completion after the 21st of October, as he would in many instances, when calling for them, find the occupiers from home, and some of the schedules not filled up, which might lead to disputes. The schedules may be filled up when deemed desirable by the occupier, and addressed to the county inspector, having the name of the occupier written on the outside when returned to the collector. 4. The employment of the relieving officer of the union, even if re-delivering of the schedules was enacted, would cause great inconvenience to the majority of the occupiers, four-fifths of whom live many miles from the residence of the relieving officer, as the union is 10 miles in length and 8 broad, and contains about 250 occupiers. 5. The county of Herts contains 12 unions, and the employment of the clerks of the union would not be required to classify the schedules if they were sent to a county inspector, to be appointed by the Board of Trade, whose required salary need not be in excess of the proposed payment to the union clerks; and a further important question arises as to who shall authorise legal proceed-

ings against defaulters. Our opinion is, the county inspector would be the better authority, and the services of the clerks of the union be altogether dispensed with. 6. The penalty for non or defective returns should vary from 40*s.* to 5*l.*, according to the extent of occupation, or the nature of the offence, whether from wilfulness or negligence. We suggest that the parish collectors be paid 1*s.* for each return, by the overseers of the poor, on receiving a certificate from the county inspector, and all penalties for defective or non returns should be paid to them, who would thus have an interest in the defaulters being fined. The payment of the parish collector in small parishes would only amount to a few shillings, and in the largest parishes seldom exceed 2*l.* or 3*l.*, which in many instances would be amply covered by the penalties enforced. 7. We are of opinion there would be no necessity to employ professional agents to make up returns for wilful defaulters, as their extent would have little effect on the aggregate returns of the county, and there can be no doubt that when a few penalties have been enforced there would not be many defaulters after the first year. 8. With the view of enabling the inspector to enter the names of all occupiers in his books previous to the receipt of the returns themselves early in November, the parish officer or collector should on the 10th of June in each year send to the inspector a list of the occupiers, taken from the rate books, with the extent of their occupations, regularly numbered, which the inspector could then enter into his books, and forward the required number of schedules for each parish on or before the 21st of October. 9. The Lords' committee recommend the filling up the returns and their delivery, as regards the acreage, by the 15th of July—but that would require another return in October, to obtain the probable yield and quality of the crops of grain and Potatoes on the 21st of October. 10. The results of the late harvests have clearly shown the necessity of deferring the returns to the 21st of October, as the failure of the Wheat crop from mildew and defective yield was not apparent until after it was reaped, in the last week in August and September; nor can the extent of such deficiency be fully ascertained till a portion of the crop is threshed out, which will have taken place by the 21st of October, to a greater or less extent, by every occupier for sale in the market or for seed. 11. The failure of the Potato crop was not apparent this year until the middle of September, but the extent of the disease will be known by the 21st of October. 12. We think it desirable that the returns should, in the first instance, be confined to occupations of 5 acres of arable and 10 acres of pasture land and upwards. The Board of Trade might at a future period extend them to lower occupations if deemed desirable. 13. Where the counties are large they might be divided, and more than one inspector of the county appointed. Each inspector should not have to superintend more than 3000 returns, for the sake of their early classification in the month of November. 14. By the above suggestions the Board of Trade would have the sole direction of obtaining the required returns, without the necessity of depending on the Poor-law Board, or diverting the Poor-law officials from their customary duties, and likewise avoiding the expenses of their employment. *Samuel Sandars, Hemel Hempsted, Oct.* 2.

Steam Engines, Feed Pumps, &c.—I will venture to say that there are very few persons who use horizontal high pressure engines that have not been occasionally troubled with their feed pumps; especially, as in my case, where the pump rod is attached to the cross-head of the piston rod, and moves with great rapidity. For several years I was thus annoyed, constantly breaking the joints; although I consulted engineers, I was assured the only remedy was to drive more slowly, by attaching it to the eccentric. At length I determined on having an air vessel and loaded escape valve in immediate proximity to the plunger, so as to compensate for the *vis inertiæ* of the water. Since I have done this I have had no trouble whatever, the escape valve lifting slightly as occasion requires. I find no difficulty in pumping into my boiler water kept at near the boiling point by the waste steam, the distance from the feed pump to the boiler being about 13 feet. I generally work at a pressure of 70 lbs. I found by experience in pumping liquefied manure, that water is more incompressible than cast-iron, and that unless an elastic medium or escape is interposed between it and the plunger, a destructive concussion and hydraulic pressure ensue. As my boiler has a steam dome nearly 4 feet high (well encased by clay and Poplar laths to prevent radiation), I find that I can keep it nearly filled with water without priming, thus giving me a more ample heating surface and abundance of steam. Vulcanised India-rubber rings are best for packing the water gauge glasses, and the same material in sheets answers admirably for flange and other joints. It is necessary to change the rings round the gauge glasses occasionally, for when they become hard and inelastic the glasses break, being unable to expand. For cold water joints a piece of gutta percha softened by heat makes a tight joint. Possibly my experience may be useful to the uninitiated. Steam at 70 lbs. to 100 lbs. per inch is very subtle and insidious, and requires very much more careful joints than low pressure steam. The same remark applies in degree to water at very high pressures. I would strongly recommend every one to have a glass water-gauge, that the engine-driver may always see the water level; a mercurial pressure-gauge is essentially necessary, or Bourdon's steam-gauge. The ordinary spring gauges, unless the lever is accurately adjusted, are most deceptive. In my case, when the steam blew off at 60 per spring guage, I found by the mercurial guage we had been working for two years at 120 lbs. per inch. Fortunately my boiler was a very good one, and of small diameter (42 inches), a most important consideration, seeing that the total pressure on the boiler is in proportion to its circumference. High pressure steam is economical; I know a farmer who works at 200 lbs. per inch. On some of our railways they work at 140. The question of expanding steam by heat (as explained in a pamphlet by Mr. Frost, of New York) is gradually gaining ground, and will become general hereafter. If heat so quickly expands steam, it should warn us against exposing our cylinders and steam pipes to a low temperature. Where coke can be used I would strongly recommend Barran's cup surface boiler, made by Messrs. Hughes, New Cross. They evaporate 10 lbs. of water for 1 lb. of coke; and one of 12-horse power, at Messrs. Collinge's patent axle factory, has consumed on an average 7 cwt. of coke per day during the last six months. *J. J. Mechi, Tiptree.*

Particulars of Hardy & Son's Experimental Prolific Red Wheat Crop, Maldon, Essex.—2 acres, 3 roods, 6 perches, sown on twelve various plans in October, as follows, with only 1 bushel and 5 pints of seed, 1855:—

No.	Contents.			Produce of corn.				Equal to per acre.				Produce of straw.	Equal to per acre.			Observations.
	a.	r.	p.	bsh.	pks.	qts.	pts.	bsh.	pks.	qts.	pts.	lbs.	tons.	cwt.	lbs	
1	0	1	26	12	1	6	1	30	0	4	1	1682	1	2	98	3 stetches sown broadcast at 2 pecks per acre; could not be well cleaned.
**2	0	2	23	24	3	4	0	38	2	4	0	2922	2	0	59	4 stetches, sown in drills, 4 rows on a stetch, 2 ft. apart, with 4 feet furrows; at 1 peck per acre.
*3	1	0	32	39	1	6	0	32	3	4	0	4295	1	11	107	8 stetches, sown in drills, 4 rows on a stetch, 2 on each side the 4 ft. furrows, at 1 peck per acre, with 4 ft. spaces in the middle for one row of Potatoes; Potato produce 50 bushels per acre, early and sound.
4	0	0	23	6	0	7	0	43	1	0	0	708	2	4	0	1 stetch sown in 8 rows, drilled at 1 peck per acre, with 4 feet furrows.
**5	0	1	22	17	3	4	0	46	0	4	0	2214	2	11	17	3 stetches, dibbled at half peck per acre, and reduced to 6 pints by thinning to single plants, with 4 feet furrows, and 8 rows on a stetch.

* Plans best recommended.

6	1 rod of four kinds, sown in spring, at end of February, in equal quantities, 1 foot apart square, or about 6 pints per acre. Produce 19 pints, equal to 47 bushels 2 pecks per acre. Straw 30 lbs., equal to 2 tons, 2 cwt., 96 lbs. per acre.—*Note.*—This did best, and did not blight so much; but is considered quite an exception, and not a rule to act upon.
7.	3 rods transplanted in spring 1 foot apart. Thin sample, and a partial failure, not being transplanted in October. Produce 21 quarts, equal to only 35 bushels per acre. Straw 68 lbs., equal to 1 ton, 12 cwt.
8.	3 yards each of two kinds, planted between another full crop. Produce of each 3 yards 2½ pints, equal to 63 bushels and 1 pint, or 7 qrs., 7 bsh., and 1 pint per acre.
9.	17 plants on 1 yard, 1854, not surrounded by other crops. Produce 466 ears, or 1 quart, equal to 18 qrs. 7 bshs. 1 peck per acre!
10.	1 yard on the very same spot 1855, planted without stirring the soil, the same minute the crop of 1854 was cut. Produce estimated as good as last year! Both specimens are reserved (9 & 10) for public inspection and criticism.
1 peck of seed per acre. 11.	2 yards of Oats; produce 3 pints, equal to 14 qrs. 1 bushel, 1 peck, 6 quarts per acre, blighted.
12.	3 yards of Peruvian Barley; produce 2 quarts, equal to 12 quarters, 4 bushels, 3 pecks, 2 quarts per acre, blighted.
13.	3 yards of common Barley; produce exactly the same as the 3 yards of Peruvian, blighted.

All was more or less blighted, as other people's of 1855, and much devoured or destroyed by sparrows, being near the town; estimated by all observers at least one-twentieth of the entire crop. *Hardy and Son, Seed-growers, Maldon, Essex.*

Farmers' Clubs.

Bakewell.—At the annual meeting of this society held last week, the health of Mr. Hudson, Secretary to the Agricultural Society of England, was given by Lord Denman. Mr. Hudson, in responding, said he felt deeply affected at the kind manner in which his health had been proposed and drunk. Fifty years had now elapsed since he first drew his breath in that lovely valley of the Derbyshire Wye, in which the ancient Saxon town of Bakewell was situated, in that vale "in whose bosom the bright waters meet;" and after the long course of his busy life, he again once more found himself, with indescribable pleasure, among the scenes of his youth, and in the society of his early friends. As the Secretary of the Royal Agricultural Society of England, he begged also to thank them for the honour they had done him in connecting his name with that patriotic body. Every farmers' club, he thought, and every agricultural association throughout the kingdom, must naturally feel a deep interest in the success of the Royal Agricultural Society of England; for it was the result of their own practical experience, and the independent representative of their own practical interests: it was an institution established by the united co-operation of the land-owners and the land-occupiers of England; not for their own individual and immediate interests, but for the promotion of improvement in every branch of husbandry, for the increase of our national resources, and for the common interest and good of our country. It was not an academy of dictation to farmers, affecting to instruct them in the management of their affairs by the promulgation of abstract dogmas or the recommendation of new theories; but it was the focus of a great system, collecting from remote sources the scattered rays of practical experience, and again diffusing them with increased intensity and effect through every region of the agricultural world; or the powerful heart, which maintained in vigour the circulation of the life-blood through the several organs of the agricultural body. It had been established, not by a Parliamentary grant, but by the voluntary contributions of many thousands of the most distinguished friends of agriculture in this country; and its recommendations had never, he believed, been made, unless founded on the most careful scrutiny of their practical tendency, and the economy of their application. One of the great results of the Royal Agricultural Society has been the revival of old agricultural bodies, and the establishment of new ones. Among these, none were, he believed, capable of supplying facts of more direct practical value than the farmers' clubs throughout the country, which in their very formation evinced that desire for improvement which was to be derived from association and discussion. Of these clubs, none could have for him personally a greater interest than the farmers' club of his native town, at whose annual meeting he had then the gratification of being present; and he witnessed with real pleasure and pride the spirit with which its objects were being carried out, and the striking results which it had already obtained. His heart's best wish was that it might continue to prosper, and that, as the Secretary of the Royal Agricultural Society of England, he might be favoured by it with many future results of its operations; and have many opportunities, in his official capacity, of receiving and carrying out from time to time the wishes of its members on any point connected with their operations or discussions; and as among the members of the club he might number so many of his old friends, he begged to assure them with how much delight he would at all times receive their communications. (Mr. Hudson resumed his seat amid loud and long-continued cheering).—Mr. J. H. Baker proposed the health of Sir Joseph Paxton, their vice-president. Sir Joseph Paxton, on rising to respond, was loudly cheered. He said—I assure you on this occasion I feel the reception you have given me so much that I cannot give adequate utterance to what I would wish to say. It is true I have been amongst you 30 years next May, and though a much larger portion of my time has been spent elsewhere, I consider myself as much a Derbyshire man as any man at this table. I came among you in a very much more humble capacity than I now hold. I came full of health, full of life, and full of vigour from the south, and I thought, perhaps, as every young man thinks, that I knew almost everything, as I had been in a good school, and had had opportunities of seeing all that had been done for the improvement of my profession. I should tell you that my father was a farmer, and that in early life I was brought up in the farm-yard. I am essentially then a Farmers' Club man. But I took to other occupations, and through perseverance and determination, I became successful, and had the good fortune to be selected to come to Chatsworth. I was rather conceited at this; I don't mean conceited in myself, but in the system of cultivation I had learned; but when I came to Chatsworth I soon found the cold bleak hills of Derbyshire different to the climate of the south, and this soon brought me to the study of what to do to get out of this difficulty. When first the Duke of Devonshire engaged me, and he engaged me himself, he told me Derbyshire was a beautiful county but not a very fertile one—that at Chatsworth they never had any flowers and very little fruit; but in a few years we contrived to have flowers and fruit in great abundance. I became a farmer when first I came to Chatsworth, and never made so much money at one time as I did out of a cow I bought. I happened to be going to Chesterfield, and I saw a good cow in a field, and went direct to the owner of the farm, and purchased the animal for 15*l.* out of the field, and sent it direct home. I kept an account of that cow's produce for four years, and it paid me an average of 30*l.* a year. I was not here in time to see the stock to-day, but I believe I am the breeder of the bull which has taken the first prize. I have always taken an interest in practical agriculture in a national point of view, and have looked at these institutions as the best means of imparting instruction to the farmer. The Highland Society of Scotland had the same sort of meetings as the Royal Society of England, which was founded on the principles of the Highland Society. The Royal Society of England was a most excellent institution, and deserved not only the patronage of the gentlemen of England but also the patronage of the farmers, because it has the valuable quality referred to by the worthy secretary, of not being dogmatical upon farmers or

other parties. They had once a North Derbyshire Agricultural Society, which held its meetings once at Chesterfield and once at Bakewell; but, generally speaking, Mr. Swaffield and some few other high farmers sent stock bred at a great expense, so that the tenant farmers could not compete with them. These farmers' clubs, therefore, gave advantages which the other society did not, because they knew that the stock exhibited was the production of their neighbours. Some farmers were disheartened, and said such a person is too successful to compete with. But that is not the way to deal with the question; their aim should be, go home and do likewise; and don't be afraid of the competition of Mr. Furniss, Mr. Jepson, and other farmers. With respect to North Derbyshire, a man may be farming down in the valley, on the hill, on limestone, gritstone, or his land may be badly drained, and he may have to contend with other difficulties; and therefore in looking at those farmers' clubs, you must have reference very much to the position in which a man has cultivated his stock for exhibition. As far as agriculture goes, it is quite impossible for a district 20 miles off to know how things should be treated here. One of the judges, Mr. Dickin, gave you good advice, but he happens to live in the neighbourhood of Mansfield, where the climate is warm; but let me tell him that if he brings his early sowings here, he will find they will rot in the ground. The great principle to look at in agriculture is this: from nothing nothing comes. If you attend to the land here, and sow the crops upon it at a period suitable to the climate, these crops will be perfection of their kind; but if you sow them at an unsuitable period there will be no crops. All plants of a similar structure to corn require a given temperature in order to come to perfection; and it is whether you get very much below or above it that your success depends, because with corn grown at a lower temperature than its nature requires, the seed becomes husky and the corn of little value. The farmers in this county have improved more than in any other, and they deserve great praise for their exertions. They are satisfied that they must rest on their own energies, and work out their own salvation in farming, and not depend upon the legislature for anything. They have fought through bad times like men. What I have told you about plants applies equally to cattle. You cannot keep cattle too warm, and the great secret of feeding is to go gradually on improving every pound of flesh until you give it into the hands of the butcher. I am always ready and most desirous to assist, as all the agents of the Duke of Devonshire are, to give improved facilities to farmers; but the error which most farmers fall into is, as Lord Ashburton said, "Men learn a great deal but they don't learn common things." He frequently saw farmers leave their cattle too much exposed; whereas by the use of a little thatch, which might be made at a small expense, they might keep them warm, and this precaution would repay them five-fold.

Miscellaneous.

Agricultural Education.—I am desirous of taking high ground for the farmer in all that relates to the future progress of his art. He must, in fact, not only continue as hitherto to be a sound and careful observer, but must be prepared to advance with his art—to become yet more accurate and precise in his observations, and to take advantage of all those aids which the sciences and the mechanical arts are presenting to him. That he has done so to a large extent is manifest to all who watch the progress of events; and among our practical farmers I could point to many who have mastered the details of the sciences now applied to agriculture, and that, too, at a time of life when the adoption of new ideas and pursuits foreign to our previous habits is no light task. Still anything of this sort must be confined to a few, and we must look to the rising generation of farmers for carrying out these matters. And it will be at once admitted that this must be effected by the introduction of a systematic agricultural education. Nowadays we require a systematic professional education, such as the other professions enjoy. The time was when the lawyer and the physician obtained their knowledge as they best might; but as these professions advanced, the necessity for something more became manifested, and they gradually obtained a systematic education. Agriculture is now in the transition stage from a purely empirical to a philosophical art, and it is necessary to introduce a regular professional education, of which botany, chemistry, and land-surveying, and perhaps other branches, should form part. As far as my own science (chemistry) is concerned, the evil consequences of the want of a knowledge of it are constantly presenting themselves in a very forcible manner. A very remarkable instance of this occurred to me some time since. I analysed a manure professing to be manufactured by a particular process, which it is unnecessary to explain; and, calculating from the amount of its valuable matters, I fixed its price at 1*l.* 5*s.* per ton—in doing which, my estimation was based on the regular market prices of these substances, so that it was possible for any person, by mixing salts of ammonia, &c., to produce a manure of equal value for that price. Some time after I met the individual for whom the analysis was made, and he informed me that he had shown it to an extensive dealer in manures, who had said that he had no doubt it was quite correct, but that he could himself afford to give for the manure a much higher price than I had fixed, because he knew that in the present state of the market he could sell it for 4*l.* or 5*l.* per ton. Here, then, was a person prepared to speculate on the ignorance of the farmer, by inducing him to pay for this substance nearly three times its actual value. It is scarcely possible to adduce a more striking illustration of the risks to which the farmer is laid open by the want of chemical information. But besides communicating a knowledge of these and similar facts, a scientific agricultural education confers another very important benefit. Agriculture is an art depending for its cultivation upon habits of close observation. One man cultivates his farm better than another, and we say that the good farmer has more experience; but we rarely advert to the fact that there is a great difference in the rapidity with which different men acquire their experience, and that he who possesses the best powers of observation does so most speedily. Now it is the peculiar merit of the sciences that they develop the faculty of observation, which our ordinary education neglects. They prepare us to watch for facts and phenomena of the most varied description, enable us to estimate their value, and to trace their relation to one another. But as matters at present stand, a man entering upon such a profession as agriculture has generally his own powers of observation to educate, and he wastes, in acquiring what he might have better learnt before, much time which might be more usefully and sometimes more profitably bestowed in other ways. *From Professor Anderson's Address to the Highland Society of Scotland on Promoting the Future Progress of Agriculture.*

Calendar of Operations.

OCTOBER.

Border of the Fens, *Oct.* 8.—The harvest has this year been very late notwithstanding the unexampled fine weather we have had, but it may now be said to be everywhere finished, and a considerable portion of the corn already threshed; the result of the harvest is much as was predicted; the good loams and heavy land yield well, the light and fen lands are unusually deficient, so as to make our estimate of the Wheat crop in Lincolnshire, Cambridgeshire, Hunts, and a part of Norfolk, considerably below an average. We do not hear of labourers being anywhere scarce during harvest, but a higher range of wages has prevailed, and we believe will prevail; no reaping or mowing was done under 8*s.* an acre, and the more general prices were above 10*s.*, even so high in some instances as 16*s.* to 18*s.* Labourers by the day had 4*s.* and two quarts of beer per day, for the month or five weeks, during which harvest occupation continued. Some very seasonable showers have fallen during the past week which have much refreshed the pastures, washed the lice and mildew from Turnips, and made the land in better order for ploughing; and now commences our second harvest of roots; Potatoes promise to be fine and abundant; Carrots are also a good crop, and the Mangolds have improved greatly. We observe that "autumn culture," though confined by the lateness of the season to a smaller space of time, is yet extending in practice. Bentall's implement sells by dozens, and every horse is bespoke for the accumulated work of cleaning land and preparing for seed. Tares have been in great demand at 12*s.* and 13*s.* per bushel, but as more are brought into the market the price has receded to 10*s.* and 11*s.* Seed Wheat was offered at our market last Saturday at 80*s.* to 84*s.* per quarter. Union contract for bread, 8*d.* the 4 lb. loaf; Potatoes from 6*s.* to 8*s.* per sack of 16 stones; root crops are sufficiently plentiful to supply food for stock during the winter, but the scarcity of hay and comparative shortness of straw will require great care and foresight to provide enough food for the possible chances of a severe winter and a late spring; the fen farmer is not in an enviable position, as while "the prosperity of agriculture" is becoming almost a reproach from the privations of large families, owing to high prices, he must suffer in silence all the evils incident to failing crops, for he will be taunted with proverbial grumbling if he dares to ask how much profit he will derive from a dear loaf when his crop will scarcely pay for cutting, as many a tenant round Ely will not bring to market more than two or three sacks per acre; the same in Deeping Fen and other large districts, which in ordinary years yield three or four times more the amount of corn than they will be able to sell this year. The highland farmer will, however, this year add to his capital considerably, and perhaps no class partake more largely of this increase of income than the implement maker; ploughs, rollers, chaff and Turnip cutters, scarifiers, threshing and dressing machines, and all other established favourites sell surprisingly. The next evidence of increasing wealth is the greater attention given to farm buildings; then artificial manures, in which there is an enormous amount of roguery going on; and lastly the labourers are decidedly advancing, in being able (excepting where there are very large families), to obtain better food, better lodging and clothing, and altogether better treatment than formerly. I also observed them to be more inquisitive about any improvement in management, and that new implements and subjects of general and rational interest seem to engage their attention. This amelioration of the condition of the agricultural labourer will be some mitigation of the disadvantage of high prices, and we hope they will everywhere produce this result, as we venture to urge that such an advance in the intelligence of the agricultural community will cause the soil and resources of the country to be devoted to the production of food more steadily and with corresponding certainty. *J. W., Peterborough.*

Notices to Correspondents.

Agricultural Statistics: *Mr. Carter.* We gather from your letter that, in order to resist the erroneous teaching of any public man, it is your opinion that the simplest and most compendious method is to attack him personally, arguing the worthlessness of any superstructure he may raise from the weak foundation on which, as regards public character, you may be able to prove that it rests. But this is precisely that style of argument which we are anxious to exclude from our columns. You say that when the farmer, pushed too hard by his enemy, turns at bay and attempts to reply to the attacks upon him, he cannot be heard, and so you prefer this other way of examining the foundation on which the reputation of his "enemy" rests. But we will promise that your replies to any attacks which you may be able to specify *shall* have a hearing, and therefore you need not adopt the personal style of attack which you complain of our excluding. Be this as it may, however, we cannot be induced by any charge of unfairness to publish such passages as were cancelled in the letter sent to us the other week.

Landowning and Cultivation: *Guy.* We should, of course, prefer farming our own land; but under existing circumstances no doubt a given capital is more productive of income when wholly invested in cultivation than if nine-tenths of it were spent in the purchase of the land cultivated.

Pig-feeding: *J. Cowley.* There is an advantage in scalding the Barley-meal before it is given to pigs, and roots of all kinds are better steamed or boiled.

The Hop: *W C M* asks for the indications existing now of the character of next year's crop.

WARNER'S IMPROVED LIQUID MANURE, OR GENERAL PORTABLE PUMP.

The valve is a ball of imperishable material, and cannot clog in action. The barrel is of galvanised iron, not likely to corrode, and can be raised or lowered at pleasure. The legs will fold together, and the whole may be carried on shoulder to any pond or tank required.

Price of 4½ in. Pump, with legs, 3*l.* 3*s.* The barrel is 27½ in. long, and the legs are 5 ft. high.

1½ inch Gutta Percha Suction Pipe, 1*s.* 6*d.* per foot.

1½ inch Flexible Rubber and Canvas Suction Pipe, 3*s.* 6*d.* per foot.

May be obtained of any Ironmonger or Plumber in town or country, at the above prices, or of the Patentees and Manufacturers, John Warner & Sons, 8, Crescent, Jewin Street, London.

Every description of Machinery for Raising Water, by means of Wheels, Rams, Deep Well Pumps, &c.; also Fire and Garden Engines, &c.—Engravings sent on application.

WARNER'S PATENT VIBRATING STANDARD PUMPS.

PATENT CAST-IRON PUMPS, for the use of Farms, Cottages, Manure Tanks, and Wells of a depth not exceeding 30 feet.

Diameter of Barrel.	Length of Barrel.		£	s.	d.
2½ in.	short 1 ft. 7 in.	Fitted for lead, gutta percha, or cast iron flanged pipe, as required.	1	12	0
2½ „	long 3 „ 3 „		1	15	0

The short barrel Pump is very convenient for fixing in situations of limited height and space, for the supply of coppers and sinks in Wash-houses with soft water from underground tanks, or in Hot, Forcing, and Plant Houses; they may be fixed, when desired, under the stage.

May be obtained of any Ironmonger or Plumber in Town or Country, at the above prices, or of the Patentees and Manufacturers, JOHN WARNER AND SONS, 8, Crescent, Jewin Street, London.

Every description of Machinery for Raising Water, by means of Wheels, Rams, Deep Well Pumps, &c.; also Fire and Garden Engines, &c. &c.—Engravings sent on application.

PARKES' STEEL DIGGING FORKS & DRAINING TOOLS.

MESSRS. BURGESS AND KEY, as Mr. Parkes' Wholesale Agents for England, have always in stock a large assortment. These Forks and Tools are now in use by upwards of 1000 of the Nobility and Farmers, members of the Royal Agricultural Society, who pronounce them to be the best ever invented, and to facilitate labour at least 20 per cent. Price Lists sent free on application, and Illustrated Catalogue of the best Farm Implements, on receipt of eight postage stamps. 103, Newgate Street, London.

GALVANISED WIRE GAME NETTING, 6*d.* per Yard, 2 Feet Wide.

BARNARD AND BISHOP, Market Place, Norwich, in consequence of improvements in their machinery for the manufacture of the above article, have been enabled to make a great reduction in the prices.

	Galvanised.	Japanned iron.
2-inch mesh, 24 inches wide	6*d.* per yd.	4½*d.* per yd.
2-inch „ strong, do.	8 „	6 „
2-inch „ intermediate, do.	9½ „	7½ „
2-inch „ extra strong, do.	11 „	9 „
1⅝-inch „ 24 inches wide	7 „	5½ „
1⅝-inch „ strong, do.	9 „	7 „
1⅝-inch „ intermediate, do.	11 „	9 „
1⅝-inch „ extra strong, do.	13 „	11 „

All the above kinds can be made of any width (under 5 feet), at proportionate prices. If the upper half is of a coarser mesh than the lower, it will reduce the prices one-fourth.

Strong Galvanised Poultry Netting, 10*d.* per yard; Galvanised Sparrow-proof Netting for Pheasantries, 3*d.* per square foot.

Illustrated Catalogues and Patterns forwarded by post. Delivered free of expense in London, Peterborough, Hull, or Newcastle. Manufacturers of Improved Strained Wire Cattle and Deer Fencing, Iron Hurdles, &c.

ROYAL AGRICULTURAL SOCIETY OF ENGLAND.
MEETING AT CARLISLE, JULY, 1855.
First Prize Awarded to

RICHMOND and CHANDLER'S No. 3 B CHAFF MACHINE, Price £7.

All the various modern Implements of Agriculture manufactured on the most scientific and improved principles, suitable for home use and exportation.—Address, Richmond & Chandler, Salford, Manchester; and 32, South John Street, Liverpool.

☞ Catalogues Gratis.

ROYAL AGRICULTURAL SOCIETY OF ENGLAND.

AT THE NORWICH, GLOUCESTER, LINCOLN and CARLISLE SHOWS,

The Prize for the best LINSEED and CORN CRUSHER was awarded to E. R. & F. Turner, St. Peter's Iron Works, Ipswich.

E. R. & F. Turner invite the attention of Agriculturists and others to the following machines of their manufacture:—

ROLLER MILLS for Crushing Linseed, Oats, Barley, Malt, &c., of various sizes, with or without Bean-mill combined. The numerous prizes awarded these Mills by the Royal and other agricultural societies, render comment on their merits unnecessary.

PATENT COMBINED GRINDING and CRUSHING MILL for reducing Barley, &c., to a fine and soft meal, and crushing Oats, Linseed, &c., is strongly recommended for the variety of purposes to which it is applicable, and for its perfect and economic working. Price 25*l*.

CHAFF CUTTERS, for horse or steam power, cutting three lengths, with facility for changing the length of the cut almost momentarily, and other valuable improvements.

OILCAKE BREAKERS, made entirely of iron, with case-hardened teeth suitable for all descriptions of cake. Price 3*l*. 10*s*.

FIXED STEAM-ENGINES, on the horizontal direct acting principle. Long experience and attention to the practical working of steam-engines of every variety, have enabled the manufacturers to offer these Engines as inferior to none—either for efficiency, economy, or durability—and at prices which will be found comparatively low.

Superior Portable Steam-Engines and Threshing Machines, Horse-Power Threshing Machines, Circular Saw Tables, One Horse Carts, and various other Implements, are also manufactured at the above Works.

Illustrated Price Lists sent free on application.

MAPPIN'S PRUNING KNIVES IN EVERY VARIETY,
Warranted Good by the Makers.

JOSEPH MAPPIN and BROTHERS, Queen's Cutlery Works, Sheffield; and 37, Moorgate Street, London. Drawings forwarded by post.

ECONOMY OF FERMENTATION.

BUSHE'S PATENT ROOT GRATER, manufactured by FOWLER and FRY, Temple Gate, Bristol, entirely supersedes the necessity of Cooking Turnips, Mangold, and other Roots; it effects a saving of 30 to 40 per cent. of the Roots, besides that of fuel. Price 3*l*. 10*s*. Printed testimonials and directions may be obtained gratis by applying to Fowler & Fry, Bristol, Licensed Makers of Corne's Patent Chaff Cutters and General Agricultural Implement Makers and Dealers. The Root Grater may also be seen in the Agricultural Department of the Crystal Palace, Sydenham.

THE CRYSTAL PALACE FLOWER BASKETS and HANGING GARDENS, made to the original Sydenham Pattern, and a variety of other new and elegant designs for the Conservatory, Verandah, Drawing Room, Boudoirs, &c., by W. Richards, Imperial Wire Works, 370, Oxford Street, London, nearly opposite the Princess's Theatre; and at the Crystal Palace.

A large stock on view from 3*s*. 6*d*. upwards. Flower Stands, Trainers, Game and Garden Fencing, and Wire Work of every description. Conservatories and Aviaries fitted up in superior style. Window Blinds of all sorts.

370, Oxford Street; and Garden Entrance, Crystal Palace, Sydenham.

WEIR'S SPIRIT DRAINING LEVEL.
Price 30*s*.; Case, 1*s*.
Requires no graduated staff or computation. Any labourer can use them.

WEIR'S PENDULUM WORKMAN'S LEVEL, for use in the Drain. Price 15*s*.
Terms cash.
Illustrated Catalogues sent post free.

Edward Weir, 2, Fitzroy Terrace, and 16, Bath Place, New Road, near Fitzroy Square, London.

BARTON'S PATENT SAFETY STABLE FITTINGS, AND ENAMELLED MANGERS.

THIS IS THE ORIGINAL PATENT for important improvements in Stable Fittings, including a method surpassing all others for conveying the straps and halter-weights to the back of the fitting to prevent the horse being cast in the stall. Stable Fittings of every description, plain, enamelled, or galvanised. All kinds of Stable Furniture in stock. Iron Hurdles, Gates, Fencing, &c.

MANUFACTURER OF KITE'S PATENT NOISELESS CAST IRON SMOKE-CURING CHIMNEY CAPS (200 on Buckingham Palace.)—The merits of this invention are proved by practical experiments daily at the Crystal Palace, in the south-west gallery.

Price Lists and Illustrations sent on receipt of two postage stamps.

James Barton, Iron Founder, &c., 370, Oxford Street, a few doors east of the Pantheon.

HORTICULTURAL WORKS AND HOT-WATER APPARATUS MANUFACTORY.
Kensal Green, Harrow Road, London.

JOHN TAYLOR and SON beg to call the attention of the nobility and gentry to the very superior manner in which they Erect all kinds of Conservatories, Vineries, Greenhouses, &c., combining every improvement with elegance of design, and durability of materials and workmanship.

Their VENTILATING APPARATUS for the Fronts and Roofs of Houses has given the highest satisfaction. Churches, Chapels, Schools, Entrance Halls, Public Buildings, &c., heated with Hot-Water Apparatus in a most economical and efficient manner. J. T. & Son have great pleasure in referring to numbers of the nobility and gentry by whom they are extensively engaged.

LANDSCAPE GARDENING, combining all the modern improvements in the CONSTRUCTION, BUILDING, HEATING, and VENTILATING HOT HOUSES, CONSERVATORIES, PINE PITS, and every other kind of Garden structure, by a practical Gardener and Horticultural Builder of 25 years' experience as Head Gardener to his Grace the late Duke of Northumberland, at Syon House, and her Majesty's Royal Gardens, Windsor, Kew, &c.—Designs and Estimates furnished for Garden embellishments on application to J. W. Thomson, F.L.H.S., Garden Architect, Exotic Nursery, King Street, Hammersmith.

HORTICULTURE IN ALL ITS BRANCHES.

JOHN WEEKS & Co., King's Road, Chelsea,

HOTHOUSE BUILDERS.

THE NOBILITY and GENTRY about to erect Horticultural Buildings, or fix Hot-water Apparatus, will find at our Horticultural Establishment and Hothouse Works, King's Road, Chelsea, an extensive variety of Hothouses, Greenhouses, Conservatories, Pits, &c., erected, and in full operation, combining all modern improvements, so that a lady or gentleman can select the description of House best adapted for every required purpose.

The HOT-WATER APPARATUS, which passes through all the Houses and Pits affording both top and bottom heat, is in constant operation and particularly worthy of attention.

Many of the Houses and Pits are of wide and lofty dimensions, and together equal in length 1000 feet. They are all effectually heated by *one boiler*, which, during the severe winter months does not cost in labour and fuel more than 3*s*. 8*d*. per day, and the apparatus is so arranged that each House or Pit may be heated separately and to the required temperature. The splendid collections of Stove and Greenhouse Plants are also in the highest state of cultivation, and for sale at very low prices. Also a fine collection of strong Grape Vines in pots, from eyes, all the best sorts.

Plans, Models, and Estimates of Horticultural Buildings; also Catalogues of Plants, Vines, Seeds, &c., forwarded on application to John Weeks & Co., King's Road, Chelsea, London.

HEATING BY HOT WATER.

JOHN WEEKS & Co., King's Road, Chelsea, Horticultural Builders and Hot Water Apparatus Manufacturers. At our two Establishments horticultural science is fully carried out in all its branches.

The accompanying sketch represents our Improved Boiler. These Boilers are very powerful, durable, and economical. The whole of our extensive nursery establishment is heated by *one boiler*, measuring only 5 ft. by 3 ft. 6 in. The Houses heated consist of forcing-houses of various descriptions, many of them are of wide and lofty dimensions, in length 1000 ft. and exposing to the atmosphere upwards of 16,000 superficial feet of glass. During the late severe winter it only cost us 3*s*. per day for fuel, and we had more than a sufficient command of heat. Any number of forcing-houses can be heated by *one of our Boilers*, and any part regulated at pleasure. Plans, Models, and Estimates of Horticultural Buildings, or Heating by Hot Water, forwarded on application.

John Weeks & Co., King's Road, Chelsea, London.

212° MILNER'S HOLDFAST AND FIRE-RESISTING SAFES (non-conducting and vapourising), with all the improvements, under their Quadruple Patents of 1840-51-54 and 1855, including their Gunpowder Proof Solid Lock and Door (without which no Safe is secure), the strongest, best, and cheapest safeguards extant.

Milner's Phœnix (212°) Safe Works, Liverpool, the most complete and extensive in the world. Show Rooms, 6 and 8, Lord Street, Liverpool. London Depôt, 47A, Moorgate Street, City.

Circulars free by post.

ONE THOUSAND BEDSTEADS TO CHOOSE FROM.—HEAL and SON have just erected extensive Premises, which enable them to keep upwards of 1000 Bedsteads in stock, 150 of which are fixed for inspection, comprising every variety of Brass, Wood, and Iron, with Chints and Damask Furnitures complete. Their new Warerooms also contain an assortment of BED-ROOM FURNITURE, which comprises every requisite, from the plainest japanned deal for servants' rooms, to the newest and most tasteful designs in mahogany and other woods. The whole warranted of the soundest and best manufacture. HEAL and SON'S ILLUSTRATED CATALOGUE of BEDSTEADS and PRICED LIST of BEDDING sent free by post.—HEAL and SON, 196, Tottenham Court Road.

NEW PATENT INVENTIONS FOR STABLE REQUISITES.

COTTAM AND HALLEN

HAVE made important additions to their original Invention of PATENT ENAMELLED MANGER RACK AND WATER TROUGH AT ONE FIXTURE, the main features of which are shown in the above engraving.

A *represents* the Patent Halter Guide and Collar Rein, the ball of which is taken to the back of the manger, works with ease and freedom up or down the guide bar, and is noiseless in its operation, as also a sure preventative against the most restive horse being cast in the stall.

B The Patent Portable Seed Box can be instantly detached from the Rack without disturbing the hay. The saving of the seed in a clean and useful state, either for agricultural purposes, or mixing with the food in the manger, is alone sufficient to claim general notice.

C The Seed Box detached, made of Galvanised Sheet Iron, light and durable.

D The Patent Saddle and Harness Bracket combined, can be used with great advantage in Harness Rooms, where space is an object, as the long portion of the bracket can be turned up out of the way when not in use.

COTTAM'S MANGERS are constructed in the best possible manner, both as to form and utility, are cleanly in appearance, durable, and impervious to infection; manufactured Plain, Galvanised, or Enamelled.

Improved Stable Guttering, with moveable safety covers, Sanitary Traps, Stable Pumps, Double Corner Mangers, Harness-room Appendages, and every article in Stable Furniture. Chaff Cutters and Oat Bruisers, kept on show at

COTTAM & HALLEN'S WORKS, 2, Winsley Street, Oxford Street, London.

WARMING AND VENTILATING.—Descriptive Catalogues and Estimates on application.

METCALFE, BINGLEY, AND CO.'S OATMEAL and CAMPHOR SOAP, in tablets (registered Nov. 3, 1854). Price 6*d.* each. This soap will be found the purest and most perfect winter soap ever introduced to the public. It preserves the hands from chapping, and renders the skin soft and agreeable.—Sold wholesale and retail by the inventors and sole manufacturers, METCALFE, BINGLEY, & Co., Brushmakers and Perfumers to H.R.H. Prince Albert, 130B and 131, Oxford Street.

CAUTION.—To prevent fraud, each tablet bears the registered mark and the names and address of the inventors, as above.

METCALFE'S ALKALINE TOOTH POWDER, 2*s.* per box.—The above may be obtained of most respectable Chemists, Perfumers, &c.

COLDS, COUGHS, ASTHMA, INFLUENZA, and DISEASES of the CHEST and LUNGS, arise chiefly from alternations of Temperature. Painful and troublesome as these diseases are, they may be speedily and effectually removed by the judicious use of

SPENCER'S PULMONIC ELIXIR.

SPENCER'S PULMONIC ELIXIR is admirably adapted to promote expectoration, ease the breathing, loosen the phlegm, abate fever, and allay the tickling sensation which occasions the cough, without tightening the chest; and for all temporary and local affections—such as wheezing, irritation of the throat, palpitation of the heart, hoarseness of the voice, influenza, &c.—it affords immediate relief. While in more chronic disorders, as periodical coughs or inveterate asthma, it is equally valuable in its effects, although, of course, a longer perseverance in the use of the article is required.

*** Ask for SPENCER'S PULMONIC ELIXIR.

Prepared only by T. Roberts & Co., Crane Court, Fleet Street, London; and sold wholesale and retail by E. Edwards, 67, St. Paul's Churchyard; Barclay & Sons, 95, Farringdon Street; Sutton & Co., 10, Bow Churchyard; Hannay & Co., 63, and Sangar, 150, Oxford Street, London; and by all respectable Chemists and Medicine Vendors in the Kingdom. In bottles at 1*s.* 1½*d.* and 2*s.* 9*d.* each. *** The bottles at 2*s.* 9*d.* contain nearly as much as three small ones.

FENDERS, STOVES, AND FIRE-IRONS.—Buyers of the above are requested, before finally deciding, to visit WILLIAM S. BURTON'S SHOW ROOMS, 39, Oxford Street, (corner of Newman Street), Nos. 1, 2, and 3, Newman Street, and 4 and 5, Perry's Place. They are the largest in the world, and contain such an assortment of FENDERS, STOVES, RANGES, FIRE-IRONS, and GENERAL IRONMONGERY as cannot be approached elsewhere, either for variety, novelty, beauty of design, or exquisiteness of workmanship. Bright stoves, with bronzed ornaments and two sets of bars, 2*l.* 14*s.* to 5*l.* 10*s.*; ditto, with ormolu ornaments and two sets of bars, 5*l.* 10*s.* to 12*l.* 12*s.*; Bronzed Fenders complete, with standards, from 7*s.* to 3*l.*; Steel Fenders, from 2*l.* 15*s.* to 6*l.*; ditto, with rich ormolu ornaments, from 2*l.* 15*s.* to 7*l.* 7*s.*; Fire-irons from 1*s.* 9*d.* the set to 4*l.* 4*s.* Sylvester and all other Patent Stoves, with radiating hearth plates. All which he is enabled to sell at these very reduced charges.

1st,—From the frequency and extent of his purchases; and
2dly,—From those purchases being made exclusively for cash.

GAS CHANDELIERS AND BRACKETS.—The increased and increasing use of gas in private houses has induced WILLIAM S. BURTON to collect from the various manufacturers all that is new and choice in Brackets, Pendants, and Chandeliers, adapted to offices, passages, and dwelling-rooms, as well as to have some designed expressly for him; these are ON SHOW over his SIXTEEN LARGE ROOMS, and present, for novelty, variety, and purity of taste, an unequalled assortment. They are marked in plain figures, at prices proportionate with those which have tended to make his Establishment the largest and most remarkable in the kingdom, viz., from 12*s.* 6*d* (two light) to 16*l.* 16*s.*

LAMPS OF ALL SORTS AND PATTERNS.—The largest, as well as the choicest, assortment in existence of FRENCH and ENGLISH MODERATEUR, PALMER'S, CAMPHINE, ARGAND, SOLAR and other LAMPS, with all the latest improvements, and of the newest and most recherché patterns, in ormolu, Bohemian and plain glass, is at WILLIAM S. BURTON'S, and they are arranged in one large room, so that patterns, sizes, and sorts can be instantly selected.

Real French Colza Oil, 5*s.* 9*d.* per gallon.
Palmer's Candles, 9*d.*, 9½*d.*, and 10*d.* per lb.

WILLIAM S. BURTON has SIXTEEN LARGE SHOW ROOMS devoted to the show of GENERAL FURNISHING IRONMONGERY (including Cutlery, Nickel Silver, Plated and Japanned Wares, Iron and Brass Bedsteads and Bedding), so arranged and classified that purchasers may easily and at once make their selections.

Catalogues, with engravings, sent (per post) free. The money returned for every article not approved of.

No. 39, Oxford Street (corner of Newman Street); 1, 2, and 3, Newman Street; and 4 & 5, Perry's Place.

SOUND AND WHITE TEETH are not only indispensably requisite to a pleasing exterior in both sexes, but they are peculiarly appreciated through life as a blessing highly conducive to the purposes of health and longevity. Among the various preparations offered for the purpose,

ROWLAND'S ODONTO, or PEARL DENTIFRICE,

stands unrivalled in its capability of embellishing, purifying, and preserving the teeth to the latest period of life. Prepared from Oriental herbs with unusual care, transmitted to this country at great expense, this unique compound will be found to eradicate all tartar and concretions, and impart a pearl-like whiteness to the enamelled surface, remove spots of incipient decay, render the gums firm and red, fix the teeth firmly in their sockets and, from its aromatic influence impart sweetness and purity to the breath. Price 2*s.* 9*d.* per box. Caution.—The words "Rowlands' Odonto" are on the label, and "A. ROWLAND & SONS, 20, Hatton Garden," engraved on the Government stamp affixed on each box. Sold by them, and by Chemists and Perfumers.

TO BE LET, A NURSERY AND SEED BUSINESS.—JOHN YOUNG begs to say that he is desirous of treating with a Tenant for his Nursery Ground, which he is at present occupying himself, and which offers an eligible opportunity to any one wishing to enter on the business. The stock is light, and the quantity of land may be made to suit the convenience of the Tenant.—For further particulars apply to JOHN YOUNG, Elm Cottage, Taunton.

TO AMATEUR FARMERS.—BELMORE HOUSE.

TO BE LET, unfurnished, for a term of years, containing three best living rooms and eight bed rooms, with offices, &c., convenient and complete stable for seven horses, with good garden and orchard. Forty acres in a ring fence to be let with it or without. Belmore is six miles from Bishopstoke Station on the South-Western Railway, in the centre of the Hambledon Hunt, and within easy distance of the H. H. and Horsley hounds.—For particulars, apply to Messrs. ATTWOOD and BIGDEN, the Close, Salisbury.

SHORT-HORNED BULLS.

TO BE SOLD, at Esholt Hall, near Leeds, three 1-year-old and one 3-year-old BULLS, all of pure Short-horn breed, the property of W. R. C. STANSFIELD, Esq.—For Pedigrees and particulars apply to JAMES M'KELVIE, Esholt Hall.

TO BE SOLD, Three fine CYGNETS; price 3*l.* 3*s.*—Apply to Mr. BROOKS, 24, Old Cavendish Street, London.

Sales by Auction.

TO GENTLEMEN, NURSERYMEN, AND OTHERS.

ROSE COTTAGE NURSERY, RETFORD, NOTTS.

MESSRS. TOMLINSON AND SON will Sell by Auction on MONDAY and TUESDAY, the 22d and 23d of October, at 12 o'clock each day, on the premises, in consequence of the ground being sold, the whole of F. Pennington's Stock of LINNEUS RHUBARB consisting of 10,000 strong, healthy Stools, the same with which he has supplied the Manchester, Sheffield, and other markets for several years, in the early part of the season; together with a NURSERY STOCK, consisting of Forest, Fruit Trees, Evergreen, Ornamental, and Deciduous Shrubs.

THAMES BANK, PIMLICO.

MESSRS. PROTHEROE AND MORRIS are instructed by Mr. Joseph Robinson to submit to public competition, on the above premises, without the least reserve, a very choice and select Collection of Fancy and other varieties of Pelargoniums, also a collection of Pompone Chrysanthemums, about sixty neat specimens, a few Azaleas, also a fine collection of Dahlias, three small Greenhouses, and a light Spring Van. J. R. assures purchasers that every plant will be correctly named and labelled. The day fixed for sale will be stated in a future advertisement.

WANDSWORTH ROAD.

MESSRS. PROTHEROE AND MORRIS have been instructed by Messrs. Chandler & Sons to Sell by Auction, on the premises in the Wandsworth Road, early next month, a collection of the following EVERGREENS, &c., comprising five Variegated and Green Hollies, from 2 to 8 feet high; Chinese Arbor-vitæ, 2 to 8 feet; Laurels, large Box, Scarlet Arbutus, very handsome; crimson and other Rhododendrons, well set with flower buds; yellow Azaleas, large Lilacs, Chrysanthemums, Daphne hybrida, Escallonia, &c., &c.; also dwarf Apples and Pears adapted for potting, Gooseberries, Currants, with a variety of other Trees. This Sale presents an excellent opportunity for gentlemen and others now planting. An announcement of the days of sale will shortly be made, and Catalogues prepared.—American Nursery, Leytonstone, Essex.—Oct. 13.

FULHAM.

LOCKHART'S ANNUAL SALE OF BULBS AND FLOWER ROOTS.

TO NOBLEMEN, GENTLEMEN, NURSERYMEN, AND OTHERS.

MESSRS. PROTHEROE AND MORRIS will Sell by Auction, on the premises, Parson's Green Lane, Fulham, on MONDAY, October 15th, at 11 o'clock, without reserve, a costly and extensive collection of BULBS and FLOWER ROOTS, being about 50,000 in number, and consisting of all the approved Hardy and Ornamental varieties of Hyacinths, Early and Late Tulips, Crocus, Narcissus, Anemonies, &c., in good condition; also 4000 Sir Charles Napier Ranunculus, the finest variety yet raised; with a collection of Herbaceous Plants, and sundries.—May be viewed three days prior to the sale; Catalogues had, 6*d.* each, returnable to purchasers, of the principal Seedmen in London, and of the Auctioneers, American Nursery, Leytonstone, Essex.

NURSERY STOCK.

TO NOBLEMEN, GENTLEMEN, CONTRACTORS, AND OTHERS.

MESSRS. PROTHEROE AND MORRIS will Sell by Auction, on the Premises, Albion Road, Stoke Newington, on MONDAY, October 22d, and following day, at 11 o'clock each day, fine Ornamental Trees, Evergreens, and Shrubs, consisting of Aucubas, Hollies, Box, Laurels, Arborvitæs, Limes, Poplars, Lilacs, Weeping Ash, Purple Beech, Scarlet Chesnuts, Evergreen Privets; Rhododendrons, Azaleas, and other American Plants; choice Fruit Trees, including Apples, Pears, Plums, Cherries, Peaches, Apricots, Grape Vines, &c.; Standard Dwarf and Climbing Roses, and a large assortment of Hardy Climbers in Pots; choice Cinerarias, Chrysanthemums, &c.—Catalogues may be had on the Premises, of the principal Seedsmen, and of the Auctioneers, American Nursery, Leytonstone, Essex.

CLAPHAM RISE.

TO NOBLEMEN, GENTLEMEN, FLORISTS, AND OTHERS.

MESSRS. PROTHEROE AND MORRIS will Sell by Auction, on the Premises, Clapham Rise, near London, on MONDAY, October 29, and following day, at 11 o'clock each day (by order of the executors of the late Mr. Henry Groom) the whole of the extensive, costly, and unrivalled collection of TULIPS, Offsets, and Breeders, which include the most rare and approved varieties in cultivation, and choice Seedlings not in the possession of any other grower, being the study of 40 years of the deceased's life, whose judgment and taste was universally admitted. Also Dutch and other Bulbs, consisting of the finest Double and Single Hyacinths, Narcissus, Crocus, Early Double and Single Tulips, Jonquils, a rich assortment of Ranunculuses, Gladiolus, Anemones, &c., with 1500 Lilium lancifolium in great variety, Japonicum, &c. May be viewed prior to the sale.—Catalogues may be obtained 1*s* each, returnable to purchasers, of the principal Seedsmen in London; and of the Auctioneers, American Nursery, Leytonstone, Essex.

GRANGE ROAD, BERMONDSEY.

TO NOBLEMEN, GENTLEMEN, NURSERYMEN, AND PINE GROWERS.

MR. WILLIAM T. ATWOOD will Sell by Auction, on the Premises without reserve, by direction of B. Drew, Esq., on FRIDAY, the 26th October, at 11 o'clock, the extensive STOCK of PINE PLANTS, the various Ranges of Graperies and Forcing Pits; the Hot-water Apparatus, comprising about 1500 feet of pipe, and three large Boilers. The above property is in good condition, and offers a valuable opportunity to persons requiring Pine Plants and Forcing Houses.—Catalogues to be had of B. Drew, Esq., Bermondsey Street; W. T. ATWOOD, Auctioneer and Land Agent, Mortlake, Surrey; and the Inns in Covent Garden.

CHOICE TULIPS.

MR. ALEXANDER has been instructed by Mr. WILLISON, of the Rose Nursery, Whitby, to offer for sale by Auction, at the Mart near the Bank of England, on WEDNESDAY, Oct. 24, at 12 o'clock, his unrivalled SEEDLING TULIPS, comprising feathered breaks of the following first-rate varieties, viz., Gem, Juliet, Eva, Queen, King, Mr. J. F. Wood, Mr. Sanderson, Sir J. Paxton, Exquisite, (Purity, and Yellow Model Selfs). Any comment upon these unrivalled flowers would be superfluous.—Catalogues may be had at the Mart, and also of Messrs. DAWE, COTTRELL, & BENHAM, Seedsmen, Moorgate Street; White Swan, West Ham; Mulberry Tree, Bromley; Mr. WILLISON, as above, and of the Auctioneer, Shacklewell and Leyton, who will execute any commissions for country growers.

NURSERY STOCK.—WHALLEY RANGE, MANCHESTER.

MR. CAPES begs to state that he has received instructions from Messrs. H. Bigland & Co., in consequence of the expiration of their lease, and the grounds having to be given up, to Sell by Auction, on WEDNESDAY and THURSDAY, November 7th and 8th, at 10 o'clock each morning, the entire of the remainder of their STOCK of Evergreens, Fruit and Forest Trees, two Greenhouses, Dutch Pit, and other Effects, at the Britannia Nursery, Whalley Range, near Manchester, further particulars of which will appear in future announcements and in Catalogues, which will be ready a week prior to the sale.—22, Princess Street, Manchester.

MR. HUMBERT will Sell by Auction the following STOCK, on FRIDAY, October 19th, at 12 for 1 o'clock, at Harwood's Farm, Watford, Herts, by direction of the Earl of Essex, 375 pure South Down Ewes and Tegs, being the whole of the celebrated flock of the Earl of Essex, also 50 Fat and Store Pigs of the best breeds, 26 Ayrshire and Short-horn Heifers and Steers, 10 Calves, 4 black Ponies, under 12 hands, which have been driven together, and 100 loads of prime Hay; also the well-known Flock reared by his lordship with so much solicitude during the past 10 years, and now disposed of solely because he intends to adopt another system of farming.—May be viewed by applying to Mr. SWANSTON, at Harwood's Farm, of whom Catalogues may be had; also at the Salisbury Arms, Hertford; the Peahen, St. Alban's; Red Lion, Barnet; King's Arms, Hemel Hempstead; King's Arms, Berkhampstead; George Inn, Bishop Stortford; Chandos Arms, Edgware; White Horse Inn, Uxbridge; and free by post of Mr. HUMBERT, Land Agent and Surveyor, Watford.

BRITISH POMOLOGICAL SOCIETY.—An Extraordinary Meeting of the British Pomological Society will be held at the Rooms, 20, Bedford Street, Covent Garden, on MONDAY, the 5th of November, to compare and determine the merits and qualities of Fruits, for the election of Members, and for general business.

It is hoped that all who take an interest in the cultivation of FRUITS and FRUIT TREES will forward to the meeting specimens of such varieties as they can obtain, correctly named, and otherwise assist in promoting the objects of the Society.

Persons desirous of becoming Members are requested to make application to the Secretary on or before the day of meeting. Members are elected at all the Meetings of the Society; and 10*s*. entrance fee, with 10*s*. annual subscription, constitute membership.—Robert Hogg, Secretary.

VINES FROM EYES.

JOHN AND CHARLES LEE beg to offer a very superior stock of all the leading kinds of VINES, both for planting out and for fruiting in pots.

Nursery and Seed Establishment, Hammersmith.

OSAGE ORANGE (MACLURA AURANTIACA).

MESSRS. MORRISON AND SON have to offer about 50,000 Plants (5 to 6 inches high) of this fine new Hedge Plant (see *Gardeners' Chronicle*, May 13, 1854), price 10*s*. per 100. Price to the trade on application. Railways to all parts of the kingdom.—Nurseries, Mountcoffer, Banff, N.B.

ORION MELON is pronounced by competent Judges to be perfection, won valuable prizes at the Crystal Palace, Regent Street, and Ipswich, and is always admired for beauty, fragrance, and richness of flavour. It is placed in the hands of Mr. Wild, of Ipswich, for distribution.

STATICE HALFORDI.

JOSEPH MORGAN has 300 healthy plants of different sizes, obtained immediately from the original stock. Also a large stock of strong flowering roots of GLADIOLUS BRENCHLEYENSIS and other choice varieties. Prices on application. A liberal discount to the trade.

Torbay Nurseries, Torquay, Devonshire.

HARDY HEATHS.

WATERER AND GODFREY respectfully invite attention to their large stock and first-rate collection of these most beautiful Hardy Plants. Priced Catalogues may be had free on application to Waterer & Godfrey, Knap Hill Nursery, Woking, Surrey.

WANTED, from 50,000 to 100,000 LARCH, about 2 feet 6 inches high. Any person having the above to dispose of, address, stating height, age, and price, to J. W. Williams, St. John's Wood, High Wycombe, Bucks.

TO THE TRADE.

JOHN GRIGOR AND CO. beg to request Nurserymen requiring strong 1-year Seedling Larch, 2-year Seedling True Native Highland Pine, &c., to apply to the Nurseries, Forres, N.B.

SEEDLING RHODODENDRON PONTICUM.

JAMES SMITH has to offer about 500,000 2 and 3-year old RHODODENDRONS: 2 years, 7*s*. 6*d*. per 1000; 3 years, 10*s*. per 1000. Also 3-year old, 1 year transplanted, 16*s*. per 1000.—Darley Dale Nursery, near Matlock.—Oct. 20.

TO NURSERYMEN AND OTHERS.

TO BE SOLD, about 1500 strong plants of PHLOXES, named, of best varieties, up to 1854; also about 200 yards of BOX EDGING, 9 years old, superior quality.—Address, A. Y., Office of this Paper.

TO BE SOLD, Four Dozen well Rooted PINE PLANTS.—Apply to D. D., Post-office, Wandsworth, Surrey.

Seed and Horticultural Establishment, Sudbury, Suffolk.

A. VAN GEERT, Nuryseryman, Ghent, Belgium, begs to inform Amateurs and the Trade that he has just published a new PRICED CATALOGUE OF PLANTS, containing many Continental novelties and other useful plants.

May be obtained on application of his Agent, Mr. R. Silberrad, 5, Harp Lane, Tower Street, London.

AMERICAN PLANTS.

JOHN WATERER'S CATALOGUE OF RHODODENDRONS, AZALEAS, &c., as exhibited at the Royal Botanic Gardens, Regent's Park, London, is now published, and can be had on application.

☞ The Catalogue describes the colours of the Rhododendrons.

The American Nursery, Bagshot, Surrey.—Oct. 20.

AMERICAN PLANTS.

WATERER AND GODFREY beg to announce their Priced and Descriptive Catalogue of American Plants for this season is now published, and will be sent free on application. As the collection of American Plants at this Nursery is altogether unequalled in extent or quality, purchasers will find it to their interest to pay a visit to the Nursery, which may be readily done by the South Western Railway to Woking Station.

Knap Hill Nursery, Woking, Surrey.

GEORGE JACKMAN begs to state his PRICED CATALOGUE of choice CONIFERA, HARDY EVERGREENS and ORNAMENTAL TREES, which are well grown, and constantly removed; also Roses, Standard, Dwarf, and dwarf-trained Fruit Trees, and Forest Trees, can be had on application by enclosing one Postage Stamp.

G. J. respectfully invites persons planting to pay a visit to his extensive nursery, one and a half mile from Woking Station, South Western Railway, where all trains stop, and conveyances can be had.—Woking Nursery, Woking, Surrey.

DUTCH FLOWERING BULBS.

JAMES CARTER AND CO.'s CATALOGUE OF DUTCH AND CAPE BULBS, the most comprehensive and select published, will be forwarded *free of charge* and *post paid*, upon application to address at foot. *The Bulbs are as usual of first-rate quality.*

James Carter & Co., 238, High Holborn, London.

R. PARKER begs to inform his friends and patrons that his PRICED CATALOGUE of DUTCH BULBS is now ready, and will be forwarded post free upon application.

Paradise Nursery, Hornsey Road, Holloway.

DUTCH FLOWER ROOTS.

PETER LAWSON AND SON, Seedsmen and Nurserymen to Her Majesty the Queen, and to the Highland and Agricultural Society of Scotland, respectfully intimate that they are now ready to execute orders for HYACINTH ROOTS, &c., &c., of the finest kinds and in excellent condition. Catalogues may be had, free, on application.

27, Great George Street, Westminster.—Oct. 20.

IMPORTED DUTCH BULBS.

EVAN PAUL begs to inform his patrons and friends that he has received his first importation of the above, which have arrived in first-rate condition, early orders for which are respectfully solicited. Catalogues forwarded postage free on application.—The Nurseries, Derby, Oct. 20.

IMPORTED DUTCH FLOWER ROOTS.

T. F. WINSTANLEY, Seedsman and Florist, begs to inform his patrons and friends that he has received direct, from one of the first growers in Holland, his first annual importation of the above, comprising Hyacinths, Narcissus, Early and Late Tulips, Jonquils, Iris, Crocus, Gladiolus, Anemones, Ranunculus, &c. &c. All are unusually fine and well ripened. Descriptive Priced Catalogues can be had on application.—28, Market Place, Manchester.

JUST HARVESTED.

SUTTON AND SONS, Seed Growers, Reading, *have now harvested some fine seed of* TRUE EARLY SHORT-HORN CARROT, MUSTARD, CRESS, LETTUCE, EARLY PEAS, *and other Seeds for early sowing.*

AGRICULTURAL SEEDS, ETC.

PETER LAWSON AND SON, Seedsmen and Nurserymen to Her Majesty the Queen, and to the Highland and Agricultural Society of Scotland, are now supplying the following seeds of the best quality:—

Crocus, Dutch, mixed, all colours	10*s*. per 1000.
Iris, mixed, all colours	5*s*. per 100.

The above, with every other kind of Flower Roots, equally moderate in price, may be had of William Denyer, Seedsman and Florist, 82, Gracechurch Street, London.

Descriptive and priced Catalogues forwarded on application.

FRUIT TREES IN POTS.

JOHN AND CHARLES LEE have the finest stock of the above ever yet offered, consisting of—

PEACHES	APRICOTS	CHERRIES
NECTARINES	PLUMS	APPLES

and PEARS

All warranted to bear good crops the first season.

Nursery and Seed Establishment, Hammersmith.

AZALEA INDICA LEEANA.

JOHN AND CHARLES LEE are now prepared to send out this fine Seedling, which for habit of growth and substance of petal, combined with perfect shape and purity, is decidedly the best white Azalea yet out. It has gained Certificates wherever exhibited. Price 21*s*.: a few extra strong plants at 42*s*.—Nursery and Seed Establishment, Hammersmith.

SPLENDID HYACINTHS, ETC. (IMPORTED).

JAMES CHARTRES AND CO. can strongly recommend their 20*s*. Collections of the above, which have always given such general satisfaction. 12 splendid named Hyacinths for pots or glasses; 12 do. do for Borders; 6 Polyanthus Narcis.; 12 Pheasant-eyed do.; 6 splendid Early Tulips for pots; 12 do. Late do. for Borders; 100 Crocus, sorts; 12 fine Iris; 6 Snowflakes; 6 Double Jonquils; 25 Double Snowdrops. A general and priced Catalogue on application.—Seed Warehouse, 74, King William Street, City, London.

CAMELLIAS.

CHANDLER AND SONS, Nurserymen, Wandsworth Road, beg to inform their friends and customers that their CAMELLIAS are finely set with flower buds this season. They are now sending out good bushy plants from 30*s*. and upwards per dozen. The best CHRYSANTHEMUMS, 12*s*. per dozen.

NEW CHRYSANTHEMUMS.

JOHN SALTER begs to announce that his Seedling Pompone CHRYSANTHEMUM "SCARLET GEM" is now in flower, and will be found far superior to everything in its class for brilliancy of colour, form, and habit. Orders now taken for plants to be sent out in spring at 7*s*. 6*d*. each. His general collection will be in bloom early in November.

Versailles Nursery, near Hammersmith Turnpike.

DOUBLE ROMAN AND PAPER WHITE NARCISSUS, 4*s*. per dozen.—The above Bulbs, the former of which is so justly esteemed for its early blooming and excessive fragrance, and the latter for its purity and elegance, have just arrived, and may be obtained at A. Cobbett's Italian and Foreign Warehouse, 18, Pall Mall, near Waterloo Place, London.

CATTELL'S EARLY BARNES CABBAGE; DO. DO. RELIANCE; Also PARAGON, IMPERIAL, KING, NONPAREIL, ETC.

JOHN CATTELL has now ready Bedded Plants of the above, at 5*s*. 6*d*. per 1000. No charge for crates, baskets, or packing. Packages of 5000 or more are delivered to London and to the Edenbridge Station of the South-Eastern Railway carriage free. A remittance or reference to accompany orders from unknown correspondents.—Nurseries, Westerham, Kent.

SELECTED SEED WHEAT.

ABRAHAM HARDY AND SON, Seed-Growers, Maldon, Essex, beg to offer their celebrated PROLIFIC RED, at 15*s*. Also Rough Chaffed, or Satin Wheat, of superior quality, at 12*s*. 6*d*. per bushel. New bag, 1*s*.; sack, 2*s*. Remittances must accompany orders. Prices of selected earliest Potatoes in variety on application.

W. NICOL, Gardener, Roslyn House, Hampstead, begs to offer the whole Stock, in one lot, of his incomparable PEA "Omer Pacha." For terms and quantity inquire as above.

W. N. begs to assert that it is both the earliest and latest Pea in cultivation, a most superb bearer, and unequalled in flavour, and may justly be termed the acme of perfection.

Should the whole stock not be disposed of in one lot by Thursday next, the 25th inst., W. N. will send it out in sealed pints at 3*s*., and sealed quarts at 5*s*.

SUTTON'S IMPROVED ITALIAN RYE GRASS.

SUTTON AND SONS, SEED GROWERS, Reading, are now harvesting their crop of Seed of this superior variety of Italian Rye Grass, and are also importing a supply of fresh Lombardy Seed. As the demand appears likely to be great, Messrs. SUTTON respectfully recommend their friends who intend to sow these articles next season, to favour them with their orders early, in case the stock should prove short.

N.B. SUTTON & SONS *do not appoint Agents for the sale of their Seeds; but they deliver them carriage free by Rail to most parts of the United Kingdom.*

W. TOWNSEND has now ready to send out GERANIUM CYDONIA CARMINEA—for description see Advertisement, 4th August; has been exhibited at the National Society, 15th June and 26th August, and obtained a Certificate. Plants 5*s.*, 7*s.* 6*d.*, and 10*s.* 6*d.* each; one over to every three ordered in the trade. Post-office orders payable at Bayswater.—Notting Hill.

THE BEST SEED IN THE WORLD, saved as recommended in GLENNY'S "Garden Almanack" from the BEST BLOOMS of the BEST VARIETIES. Balsams, six classes, 37 stamps; mixed, 13 stamps. Geranium and Pink, 30 stamps; Hollyhock and Dahlia, 13 stamps; Quilled Aster and large flowering Stocks, 7 stamps. Sealed packets only.—G. GLENNY, Fulham. The trade supplied.

RARE AND NEW FERNS.

R. KENNEDY having at present a good assortment of the more choice species of FERNS would especially recommend the following selection:—

HARTLEY'S Rough Plate, Sheet and Rough, Tiles, Striking and Bee Glasses, Milk Pans, Cucumber Tubes, and Wasp Traps, as Horticultural List.

Milled Sheet, White Lead, and Lead Pipe. Paints, Colours, and Varnishes, see Colour List, which can be had on application.

Established more than 100 years.

THE CRYSTAL PALACE FLOWER BASKETS and HANGING GARDENS, made to the original Sydenham Pattern, and a variety of other new and elegant designs for the Conservatory, Verandah, Drawing Room, Boudoir, &c., by W. RICHARDS, Imperial Wire Works, 370, Oxford Street, London, nearly opposite the Princess's Theatre; and at the Crystal Palace.

A large stock on view from 3*s.* 6*d.* upwards. Flower Stands, Trainers, Game and Garden Fencing, and Wire Work of every description. Conservatories and Aviaries fitted up in superior style. Window Blinds of all sorts.

370, Oxford Street; and Garden Entrance, Crystal Palace, Sydenham.

ECONOMY OF FERMENTATION.

BUSHE'S PATENT ROOT GRATER, manufactured by FOWLER AND FRY, Temple Gate, Bristol, entirely supersedes the necessity of Cooking Turnips, Mangold, and other Roots; it effects a saving of 30 to 40 per cent. of the Roots, besides that of fuel. Price 3*l.* 10*s.* Printed testimonials and directions may be obtained gratis by applying to FOWLER & FRY, Bristol, Licensed Makers of CORNE'S Patent Chaff Cutters and General Agricultural Implement Makers and Dealers. The Root Grater may also be seen in the Agricultural Department of the Crystal Palace, Sydenham.

PAXTON WORKS, SHEFFIELD.

SAYNOR AND COOKE, Manufacturers of the celebrated Exhibition Prize PRUNING, BUDDING, and GRAFTING KNIVES, VINE and PRUNING SCISSORS, &c. These articles are Warranted to stand any kind of work, and to carry the keen edge of a razor without requiring to be sharpened so frequently as is usually necessary to obtain that sharp edge so requisite for the comfort and use of the practical gardener. The blades are also warranted to wear through to the back. They are used by all the eminent gardeners in England, Ireland, and Scotland, and can be purchased of any nurseryman or seedsman in the three kingdoms. Those who may not have used them are respectfully solicited to give them a trial. The Great Exhibition Prize Medal of 1851, and the Prize Medal of the Horticultural Society of Manchester, at their Show of 1854, was awarded to SAYNOR & COOKE for their superiority of material and workmanship. Established 1738.

CARSON'S ORIGINAL ANTI-CORROSION PAINT, specially patronised by the British and other Governments, the Hon. East India Company, the principal Dock Companies, most public bodies, and by the nobility, gentry, and clergy, for out-door work at their country seats. The Anti-Corrosion is particularly recommended as the most durable out-door Paint ever invented, for the preservation of every description of Iron, Wood, Stone, Brick, Compo, Cement, &c., work, as has been proved by the practical test of upwards of 60 years, and by the numerous (between 500 and 600) testimonials in its favour, and which, from the rank and station in society of those who have given them, have never yet been equalled by anything of the kind hitherto brought before the public notice.

Lists of colours, prices, together with a copy of the testimonials, will be sent on application to WALTER CARSON & SON, 9, Great Winchester Street, Old Broad Street, Royal Exchange, London. No Agents. All orders are particularly requested to be sent direct.

GRAPE VINES FROM EYES IN POTS.

LUCOMBE, PINCE, AND CO. beg respectfully to call attention to their remarkably fine stock of Grape Vines, raised from eyes in pots, in a bearing state.

L., P., & Co. having two years ago erected a Vinery 90 feet long for the especial purpose of proving every good Vine in cultivation, are enabled to say that the Plants sent out by them are true to name.

LUCOMBE, PINCE, AND CO.,
EXETER NURSERY,
EXETER.
ESTABLISHED 1720

THE PAMPAS GRASS,
"GYNERIUM ARGENTEUM."

LUCOMBE, PINCE, AND Co. having now for sale the finest stock of flowering plants in this country of the above, are enabled to offer their well established plants to bloom this autumn at the following prices:—

Fine specimens with two flower stems ...	21*s.* 0*d.* each.
Ditto with one ditto	10*s.* 6*d.* „
Smaller plants to bloom next year	7*s.* 6*d.* „

L., P., & Co. have also healthy seedlings at 30*s.* per dozen, which will be ready in October, which, however, they deem it right to say will most probably not bloom for two years. To such parties as wish at once to see the plant in its beauty, L., P., & Co. would strongly recommend the larger sizes, as they are much better and cheaper.

Few plants are more ornamental than this Gigantic Grass, the leaves (which are more than 7 feet in length, curving gracefully outwards) grow in large tussocks, thereby producing a very fine effect, and from the midst of these numerous flower stems arise to the height of from 6 to 8 feet, surmounted by elegant panicles of inflorescence nearly 3 feet long, resembling beautiful waving plumes of silvery feathers. It is perfectly hardy, and is also easy of cultivation. A grand specimen of this noble plant is now in the Exeter Nursery, pushing up nearly twenty large flower stems and numerous small ones, and will continue to be an object of great attraction for a considerable time.

EXETER NURSERY, EXETER.
ESTABLISHED 1720.

TO PLANTERS.

JOHN SCOTT, of the Merriott Nurseries, Crewkerne, Somerset, has for Sale large and fine specimens of EVERGREENS, &c., at the lowest prices. The following are fine bushy plants, from 3 to 6 and 7 feet high, and from 6 to 16 feet in circumference:—Deodars, Cedars of Lebanon, Red Cedars, Arbor-vitæ, upright Cypress, Silver Fir, Evergreen Oak, Portugal Laurel, Arbutus, &c., in large numbers. Also all the leading Deciduous Trees from 6 to 16 feet high, all moved last May, and are now finely rooted; Forest Trees, many hundred thousands ready for planting; with fine Standard and Dwarf-trained Fruit Trees, of all the best and leading kinds, at very moderate prices. Gentlemen requiring large numbers will find the above well worthy of attention. Prices and signs sent to any application.—Oct. 20.

NEW ROSES.

M. DUCHER, Rue du Vivier Guillotiere, Lyons, France, offers the following NEW ROSES:—

MARSHAL PELISSIER—Hybrid Perpetual, very strong growth; flowers very large and very highly perfumed; petals bright red on the edge, and very pale beneath. This plant deserves a place in the best collections.

GENERAL SIMPSON—Hybrid Perpetual, very strong growth, and flowers abundantly; flowers medium size, very full and well-shaped; bright red carmine—superb plant.

MARCHIONESS OF MURAT—Strong growth, flowers large, full, and very well-shaped; very beautiful blush and very agreeable perfume. Somewhat resembles Duchess of Sutherland.

Each Plant 15 francs, or 12*s.*; to be delivered on the 1st November next.

A NEW SEEDLING APPLE FROM THE RIBSTON PIPPIN.

STEPHEN SHILLING begs to offer to gentlemen and the trade Trees of his entirely new Apple named OMER PACHA, it being a first-rate hardy grower, strong compact habit, early and productive bearer. Fruit excellent flavour (dessert), ripe in November, keeps until May. Respectable testimonials given from those who have tasted the fruit. Strong plants supplied at 5*s.* 6*d.* each, or 60*s.* per dozen. The usual discount to the trade where one dozen or more are taken. Early application is requested as the stock is limited; all orders carefully and promptly attended to. Fruit of the above can be seen at the office of the *Gardeners' Chronicle*, the British Pomological Societies' Rooms, 20, Bedford Street, Covent Garden, Messrs. Nutting & Son, 46, Cheapside, Messrs. Sutton & Sons, Reading, and at the
North Warnborough Nursery, near Odiham, Hants.

MESSRS. E. G. HENDERSON AND SON beg to announce that they have now received their noted collection of HYACINTHS in excellent condition, and for the assistance of those persons unacquainted with the culture of the Hyacinth, printed instructions will be given gratis with each order they are kindly favoured with, Catalogues of which, together with their Plant and Seed Lists, will be forwarded post free on application.

CUCUMBER HENDERSON'S NAPOLEON III., in packets, 3*s.* and 5*s.* 6*d* each.

CALCEOLARIA, CINERARIA, and PRIMULA SEED of first quality, 2*s.* 6*d.* and 5*s.* per packet.

FUCHSIAS.—Banks' Favourite, 10*s.* 6*d.*; Prince of Wales, 10*s.* 6*d.*

NEW RHODODENDRONS.—Boothi, Hookeri, Calophyllum, Kendricki, Eximium Windsori Leucanthum.

GYNERIUM ARGENTEUM (PAMPAS GRASS).—E. G. H. & Son having in their possession the largest stock in the country of this noble ornamental Grass, can supply free healthy seedling plants, which are superior to any other at 2*s.* 6*d.* each, 25*s.* per dozen, or 7*l.* 10*s.* per 100.

Wellington Nursery, St. John's Wood.

WATERER'S AMERICAN PLANTS.—A new DESCRIPTIVE CATALOGUE is now published of the celebrated Collection of hardy Scarlet and other Rhododendrons, as exhibited by JOHN WATERER at the Royal Botanic Gardens, Regent's Park; it will be found to contain a few practical observations on their successful management, and will be forwarded on application by enclosing two stamps for postage. Apart from its enumeration of the most popular American Plants in cultivation, a List of choice Coniferæ will be seen, embracing the latest importations of this fine and hardy tribe of Plants.

J. W. has now the pleasure to offer in large quantities, and of all heights, the following selection of CONIFERS, with the remark that they are all now growing in the open ground, are bushy and handsome as can be desired, and have been transplanted each succeeding spring, whereby no risk can be encountered in their removal from the nursery:—Araucaria imbricata, Cryptomeria japonica; Pinus Douglasi, Cembra, excelsa, Lambertiana, insignis, Jefferyana, Beardsleyi, tuberculata, &c.; Cedrus Deodara, Lebanon, and Africana; Wellingtonia gigantea, Cupressus, Juniperus, Taxus, Thuja, &c.

☞ The attention of gentlemen, public companies, and others engaged in planting, is especially directed to the foregoing; indeed, all intending planters would be well repaid by a visit to inspect our stock, as much may be seen which of necessity cannot be given within the limits of an advertisement.

The Nursery is easily reached by railway, being near the Farnborough Station, South-Western Railway, and Blackwater on the South-Eastern Railway.

The American Nursery, Bagshot, Surrey.

AZALEA INDICA.

JOHN AND CHARLES LEE beg to offer good Plants of the most select kinds of AZALEA INDICA, well set with buds, at 18*s.*, 30*s.*, and 42*s.* per dozen.

Nursery and Seed Establishment, Hammersmith.

NEW VARIEGATED GERANIUM—MRS. LENNOX.

JOHN AND CHARLES LEE are now sending out this novelty, which is a decided improvement on The Mountain of Light. It is of much more vigorous growth than that variety, the margin of the foliage is of a purer white, and in other respects it possesses the same good qualities. Price 7*s.* 6*d.*

Nursery and Seed Establishment, Hammersmith.

NEW CUCUMBER—"HIMALAYA."

CHARLES TURNER has purchased the Stock of Seed of this splendid Cucumber, that was so much admired at the Crystal Palace Exhibition in June last, and which also received Certificates at the Horticultural Society's Show at Gore House, and at the Royal South London Society's Show. It grows from 24 to 30 inches in length, is of very handsome shape, black spine, and an excellent bearer. Packets containing three Seeds, 2*s.* 6*d.* per packet.—Royal Nursery, Slough.

CHARLES SCHOFIELD (late J. SCHOFIELD & SON), SEEDSMAN and FLORIST, begs to invite the attention of Florists to his large and superb Stock of CARNATIONS, PICOTEES, PANSIES, PINKS, HOLLYHOCKS, &c., which he now offers at greatly reduced prices of the best quality. A Catalogue, descriptive of the above Flowers, is now ready, and will be sent on application.

PANSY SEED, in Packets, selected with the greatest care, from the best Show Flowers, 2*s.* 6*d.* each.

Also a few Packets of Extra-fine CALCEOLARIA SEED, 2*s.* 6*d.* each.

The finest HOLLYHOCK SEED, 1*s.* per Packet.

Knowsthorpe, near Leeds, Yorkshire.

THE BEST TWELVE HYACINTHS FOR POTS OR GLASSES.

(*Parcels if not less than 20s. value, carriage free.*)

The best 12 HYACINTHS imported (by name) ...		9*s.*	0*d.*
Double do. for open ground, mixed ...	per doz.	4	0
CROCUSES, many sorts mixed, ...	per 1000	12	6
TULIPS, fine mixed, early for pots or borders,	per 100	6	0
ANEMONES, fine double mixed	per 100	5	0

And all other BULBOUS FLOWER ROOTS at low prices, as per Catalogue just published.

JOHN SUTTON & SONS, Seed Growers, Reading, Berks.

The Gardeners' Chronicle.

SATURDAY, OCTOBER 20, 1855.

WE learn from the *Sydney Herald* of May 17 that a Society has been established in New South Wales for the IMPROVEMENT OF HORTICULTURE IN THE COLONY. Sir WILLIAM DENISON has taken it under his patronage, which looks well, and, if we can judge from the report of the proceedings at the inaugural meeting, it promises to be supported satisfactorily. On that occasion an excellent address was delivered by Sir CHARLES NICHOLSON, one of the Vice Presidents, which deserves to be given at greater length than our space will permit. We must, however, find room for some extracts.

After explaining the objects for which the Society was instituted, he proceeded to the following effect:—

"It can require little to be said in commendation of objects alike fraught with the greatest practical utility, and connected with some of our purest and happiest associations. In many of its departments, horticulture may be said to be of exclusively English origin, and to have been carried by our countrymen to a degree of perfection which it has not elsewhere attained. England is unrivalled for her park scenery, for that endless variety of landscape which results from the combination of the natural with the artificial, and for happily blending trees and shrubs, and flowers and natural weeds, in doing which art appears to borrow all that nature can bestow, and nature herself to be indebted for some of her most enchanting aspects. A beautiful garden is perhaps the most perfect creation of man's skill, and affords materials for some of the most refined of the enjoyments of which his nature is susceptible. The lot has been assigned to us by Providence of occupying a new land, and converting it into a civilised abode. In the execution of this task our first and foremost obligation has been to look to utilitarian objects only, and to disregard anything unconnected with immediate gains or practical ends. Such a spirit has, however, been too prevalent, and it is impossible to travel through our adopted land without lamenting the all but entire absence of those graceful and pleasing embellishments which characterise every rural dwelling in England. Our miserable wooden and bark-covered huts are seldom furnished with a garden, or it is enclosed by an unsightly and dilapidated fence, and its contents seldom extend beyond a few Pumpkins and Peaches. The domains of our gentry exhibit too generally an entire absence of taste in their disposition, with the same character of dilapidation and want of care that characterises the more humble abode of the labouring man. How rarely do we here see the trim garden of the English cottager, full of sweet-scented and beautiful flowers—objects of care and solicitude, and mixed up and twining themselves even with the affections of the whole household. No cold and unsympathising spirit, actuated by motives of mere gain, influences the English cotter in his desire to embellish his humble home. The spirit which animates the poor man pervades all classes. The nobleman delights in his parks, and cherishes the old ancestral trees which for ages have been the pride of his district. *If Englishmen love their homes, it is because their homes are beautiful;* and because the universal sentiment leads every one to embellish his home or dwelling, however humble, with the mute but eloquent witnesses of our earnest participation in some of the noblest and yet gentlest sympathies of our nature. *Absence of such an all-pervading taste in this colony is, I am convinced, productive of much social mischief.* The casual occupant of a rude cottage is linked to it by no associations connected with labour bestowed upon its embellishments. The children have set no flowers, nor has he ever reposed beneath the shade of the tree he planted. And what is the result of this state of things? *It is true that abundance in the way of food may exist; but that abundance is but too often associated with dirt, discomfort, and squalor.* Even those from whom better things might be expected exhibit an indifference and an apathy scarcely less blameworthy. It seems to be the too general tendency of men to live in this country with the predominant desire of quitting it—as mere wayfarers, and not as the permanent dwellers in the land. It is an established and well grounded fact that not only does much of the social comfort and happiness of a community depend upon the formation of a taste for, and an appreciation of natural beauty, but such a taste and appreciation have ever a moral significance scarcely less important. A perception of, and relish for, that which is beautiful in the works of creation, can hardly fail to be accompanied with holier aspirations, directed to the Great Author of all that is good as well as beautiful in nature. Sordid, and debasing, and profane habits are not likely to find an abiding-place in the breast of that man who is capable of enjoying nature in her simplest and most attractive forms. It is with the hope that this Society may in some measure counteract a state of things so much to be regretted, that I gladly join its ranks. It is our privilege and our good fortune to occupy a country far from being destitute of the elements of natural beauty; it is one affording materials and a capacity for embellishment, merely requiring the judicious hand of taste. Many of our indigenous forests may, with a little care, and by an eye able to appreciate the picturesque, be made to assume the character of the most highly ornamented English parks. With a climate of more than Ausonian softness, there are none of the vegetable productions of Europe that cannot be acclimatised, from the Oak of England to the Olive of classic Greece; and there is no reason why we should not reproduce on our shores a Windsor forest, the groves of Cintra, or the woods of a Subiaco. To aid in the realisation of some such results is, I apprehend, the province of this Society."

We were not prepared for such a description of the social state of the great Australian Colony, and it must be owned that if the picture drawn by Sir CHARLES NICHOLSON is anything like the condition of New South Wales, it stands wofully in need of all the humanizing effects which so refined a pursuit as that of gardening can impart. Let us hope, however, that there was a little pardonable exaggeration in the recital of the social circumstances which rendered the establishment of the new Society so desirable. At least we imagine that we discern evidence of such a feeling in the speech of Mr. SYLVESTER, who followed Sir CHARLES NICHOLSON. This gentleman drew a most deplorable picture of the state of rural affairs near Sydney. After pointing out in language which might be almost called eloquent, how horticulture is the mother of art—if art be worth cultivating at all—he proceeded to say, "at this remote end of the world we, like our first parents, are placed in a garden, to dress and to keep it, and I would ask what as yet we have done in any way to fulfil our mission? Have not we, in neglect of all the great capabilities of this land, fed too long on what ought to us to have been forbidden fruits? Have we not with a sordid selfishness lavished our time and means in idle and exotic luxuries, instead of manfully making this country that which it ought to be—the habitable home of millions? Have we now in Sydney any complete collection of the natural Grasses of the country of which we are accustomed to boast so much?—of the fruits which are, or might be made available for human food, or of the plants and herbs of which the chemist may avail himself in his researches? There is no institution in this colony connected with horticulture, which in any way promotes that which was the great design of horticulture, the virtue, the happiness, and the comfort of mankind. I do not mean for one moment to reflect upon any existing institutions, governmental or otherwise, further than to declare them inefficient,

and insufficient for the present wants of the colony. Some may say that a governmental institution may be made sufficient for all purposes I have mentioned; but I reply that such an institution has two great objections. It is at once *too* exclusive and *too* popular; too exclusive in its management for anything like instruction for the people; too popular in its application to be adapted to anything more than purposes of amusement. At present we have done nothing—positively nothing with *our* garden, for the help and maintenance of the nations around us. The bread we eat, the fruit we partake of, the liquors we drink, are derived exclusively from the produce of foreign countries. An indigenous grain of corn is never baked; an indigenous Grape is never pressed; an indigenous wool is never worn in this country. We partake of all the blessings derived from these processes more largely than most nations. Why should we not contribute to them in our turn? Is it high and noble and honourable, to allow our country to be declared a desert? It is too bad to be forced to confess that not a crumb has civilised Australia placed upon the table of the world—that her gold is her only treasure; and that her beautiful mountains and valleys have no other boon for the great family of man. I am convinced you will not longer allow this state of things to continue, but by your support, your constant attendance at our monthly meetings, and our annual exhibitions, make the society an institution worthy of the colony itself, and the great and enterprising nation it sprung from."

Such assertions from the mouth of a speaker addressing a great meeting of the gentry of Sydney have much astonished us. We had heard of the vineyard of a Busby and the Fig and Raisin grounds of a Mitchell; we had seen the glorious corn of Adelaide, and the Australian wools unsurpassable for quality; we had even drank the luscious wines of a MacArthur, with a firm belief that at Camden he had laid the foundations of a great wine trade with Asia, an opinion confirmed by the high position assigned to them in the Paris Exhibition. But we now see that we have been in a state of delusion in this matter, for Mr. Sylvester declares that there is no corn, no fruit, no wine in that land which is not borrowed from the stranger; not a grain of corn is baked, nor a Grape pressed, nor a wool-pack converted into clothing. All comes from abroad. We cannot but suspect such statements to be very highly coloured.

It is true that another speaker dwelt upon the same subject in a similar strain.

"In a country like this," said Mr. Shepherd, "where not one-tenth of our pastoral population has the means of procuring vegetable diet, and where even an Irishman considers himself a lucky fellow if he can get Potatoes for his Christmas dinner, and where flour has to be carted over hundreds of miles of bad roads, the necessity for some amelioration must be apparent. But what has been the attempt to procure plants or fruits suitable for these localities, where we constantly hear the remark—'Oh, it's no use attempting to garden or farm here; we have often tried, but the hot winds settle everything.' In the colony of New South Wales alone there are probably over 100 millions of acres of land, every 10 of which are, on an average, required to furnish food equal to the support of one ox, and yet no attempt has been made to find herbs or Grasses, either indigenous or exotic, which would withstand our hot winds and our periodical dry seasons, and which, by being spread over our vast plains and forests, would prevent those visitations from starving to death thousands and tens of thousands of our cattle. We, professing to be a civilised people, have occupied this vast "island continent" for upwards of half a century. Are we justified in keeping it when we have done so little to improve the condition of its original owners (in fact we have rendered their condition worse than it was before), or so little besides adding a few bales of wool, a few nuggets of gold, and a few casks of tallow? Let us bestir ourselves and remove this reproach from us, by inquiring into the capabilities of the thousand and one species of Grasses, and herbs, fruit, roots, and timbers. We owe this not only to ourselves, but to the world at large. For all that we cultivate we are indebted to foreign countries; can we find nothing to give in return? Unless we use our best exertions with a view to accomplish something like these results, we forfeit the only tenure by which we can justly hold the land, and the Russian serfs would have as much right to it as we have."

To such a confirmation of his predecessor's remarks we could add nothing but an expression of commiseration for the unhappy fate of the men whose gold is their sole possession, if we really believed the declamation used on this occasion. But we hope better things of the past as well as the future of New South Wales. In the meanwhile we have no doubt there is plenty of room for improvement; and we hope the new society will succeed in its endeavours to bring it about.

It will have been seen by a communication in our last Number (p. 678), that experimentalists are puzzled to understand how it is possible to make two embryos grow together by grafting. It seems to be considered impracticable so to unite the seeds of an Orange and a Lemon as to blend them into one single plant from the very beginning of their growth. Undoubtedly the operation is attended by some difficulty. Skill and a sound knowledge of the nature and structure of seeds are demanded of those who would perform it. For that reason, indeed, it was that we offered a valuable reward to the first who should succeed. Had it been a mere puzzle which could be solved by some lucky accident, we should have consigned it to the limbo of rebuses, charades, and similar puerilities. But knowledge and the power of applying it were demanded, and for this reason it appeared to be an excellent subject for experiment; certainly not merely for the sake of a trifacial Orange, which might be easily obtained in Alexandria.

We have already stated, in reply to an inquirer, that it would probably facilitate the operation if the surfaces to be united are pared down, just as is done when common grafts are united. But we are by no means sure that this is indispensable. On the contrary, many facts indicate that mere contact will produce the necessary union. No one can be ignorant that Cucumbers often come as twins; so do Nectarines; and we have now before us a pair of Coe's Golden Drop Plums completely united for about half their length. In all such cases no removal of the surface of the parts took place where they joined. They united in consequence of being firmly pressed together when very young, and in the early stage of growth while the tissues were young, tender, and forming fast.

A similar example is presented by the monstrous Apple of which a figure is annexed. In this instance two Apple flowers, accidentally brought into close

contact in the earliest state of the bud, being kept firmly in contact as they advanced in growth, ended by becoming half incorporated; notwithstanding which they finally became a twin fruit, consisting of two very unequal halves. In the smaller only four cells of the seed were formed, in the larger but three. In other respects the structure was complete; but each was furnished with a pair of elevated lines on the side next the line of junction, as shown in the figure. The nature of these lines is unknown to us. What is particularly deserving of attention here is that the hairy surface of the young Apple flower offered no obstacle to the junction in question; possibly it took place before the hairs had formed.

Such being the case it becomes a question whether in grafting seeds it is at all necessary that the embryos should themselves unite. It may be indeed conceived that the firm, solid, highly carbonized, and scarcely azotized tissue of which such an embryo as that of the Orange consists, would from its very nature be unlikely to form an adhesion; just indeed as grafters find that old wood is very difficult to operate upon. It is by the young tissue, when first growing, soft, tender, succulent and rich in azotized matter that junctions are effected. Is it not then highly probable that if embryos are to be grafted on each other the union must take place between the surfaces of the young radicle and the tender lengthening stem when first born? We think so. And upon that supposition it may be a question whether the operation now under discussion may not be most easily and certainly performed by allowing the embryos to enter upon the early stage of germination before they are finally tied together.

Suppose that a couple of Orange pips were allowed to grow just long enough to be handled, and then had, in each case, one of the cotyledons removed so that the nascent stems could be secured to each other with collodion, or a film of India-rubber, or some such elastic matter. We only throw this out as a suggestion.

VEGETABLE PATHOLOGY.—No. XCII.

373. Caries (*Decay*).—If decay is occasionally rapid in plants where the older tissues are not capable, in consequence of their thickened walls, of containing or conveying much fluid, though when their vitality is once depressed they may absorb into their substance a sufficient quantity of moisture to enable chemical decomposition to run its course, much more may we expect rapid destruction where every cell is gorged with juice, and the condition of the atmosphere is such as to prevent a sufficiently rapid interchange and evaporation of the fluid received from the roots. Accordingly, under certain circumstances, decay takes place in many of our succulent vegetables, independently in the first instance of any aggravating cause, and in many cases from mere constitutional weakness without any external agent. And in such cases it is generally observed that the first part which suffers is either some vessel or large duct, the walls of which lose their colour, exhibiting various shades of brown up to black, and are frequently studded with minutely granular matter, which consists of some combination of ulmic or humic acid, and which occasionally is so abundant as to block up the passage. It was once thought, indeed, that this matter was some condition of certain minute parasitic fungi; but this notion is at the present time completely laid aside. Such tissues when young are doubtless extremely active, but it is very doubtful whether, for the most part, after their full formation, they continue to carry fluid, or are more than mere air-ducts similar in function, so far as vegetable and animal structures admit of comparison, to the tracheæ of insects. Their vitality, which was at first extremely active, becomes by degrees depressed, and the walls are therefore subject to be affected by such causes as promote decomposition. In decaying vegetables, consequently, the first thing which constantly strikes the observer is the dark colour of such tissues, rendered frequently more remarkable by the contrast of the cells, still in a natural state, by which they are surrounded. If a favourable condition of outward circumstances takes place, the evil may proceed no further, especially if it is not sufficiently extensive to suppress to any great extent the proper performance of the functions of such tissues. If, however, no alleviation of outward conditions takes place, it is evident that in no way can the taint be more rapidly communicated than by these vessels, which thread every part of the plant. The presence, then, of such darkened ducts or vessels in tissues, though undoubtedly indicative that disease has existed, does not so certainly prove that rapid destruction will take place. For such diseased cavities may exist without ever affecting the neighbouring tissues, and in woody stems they may continue in the same condition for years. This circumstance is the more worthy of consideration because appearances of this kind have been brought forward in support of particular views as regards the Vine mildew, and if not properly estimated might lead to the destruction of many a tree which might be fruitful for generations, should the original cause of evil be removed. It was found, for instance, in Portugal that in the trees which had been much affected by mildew many of the ducts were completely gorged, or at least deeply stained with brown matter. Now this is no uncommon consequence of the presence of fungi on plants, depressing their vitality and acting consequently on those tissues most easily affected. It is notoriously the case in the diseased tubers of Potatoes, the roots of Turnips, and other like instances. It does not follow, however, that the decay will extend further, and we have seen sections of such Vines in which in spite of a few blackened ducts the whole of the surrounding tissues were beautifully clear, without the slightest discoloration. Doubtless if the disease should prove persistent, such stems may in the end become seriously affected, but so long as the appearance is confined to the ducts of the more internal rings there is no great danger. If, however, disease commences in such tissues while they are yet young and filled with fluid, and in the act of multiplication, or where they serve as reservoirs of nutritive matter as in certain leguminous plants, insomuch that every grain of starch or other granular matter, whether nitrogenous or otherwise, or even the oil-globules them-

selves, are impregnated with brown matter acting as a putrefactive ferment, the evil spreads so rapidly that every cell is involved, and no subsequent change of circumstances will materially check its progress. *M. J. B.*

MR. UNDERHILL ON STRAWBERRY GROWING.

My mode of cultivation is to fix on a piece of ground entirely free from shade; about the beginning of July, I commence preparing it by manuring it thoroughly, and if the soil be light I add some marl, as most Strawberries are fond of a stiff loamy soil, and it tends to throw them into bearing instead of leaf. When the ground is dug and the plants are ready tread the soil hard and well where they are to be planted. Choose runners with short roots, indeed, th se that have scarcely tasted the soil are preferable, as they more readily shoot into the ground, and there is nothing afterwards to check their progress. Though care should be taken to plant them a little below the surface, pressing the soil firmly to the roots, yet the heart must not be covered with earth; if the weather be not rainy they will require water, and if they could also be protected from the heat of the sun for a few days it would be all the better. The second, third, or fourth runners, or even runners from either of them, will bear fruit as well as the first runner, though many consider the latter as the only one that will bear. The great object is early planting, so as to get your plants well and deeply rooted before the frost sets in, otherwise the frost by raising the soil would raise the plants with it; then comes a thaw, the soil sinks and leaves the plants worse than freshly transplanted, nay almost out of the ground; again, by early planting you obtain the finest and largest fruit the first year, and the greatest crop the second. Then directly root up your plants, on no account keep them a third year, for after having gathered two good crops from your plants their strength and vigour must necessarily be exhausted, and no more fine fruit can be obtained from them; indeed for size and quality an annual cultivation is best.

Strawberry beds should always be kept entirely free from weeds, and the roots as distinct as when first planted out. In the autumn, when you have taken sufficient runners for your new plantations, clear the old roots of all the remaining runners together with the old straw which has been laid under the fruit, but the leaves of the plants are not to be taken off. When the beds are cleaned in the spring, some rotten manure should be spread over the surface from which great advantage will arise, as the rain will wash the goodness of the manure to the fibrous roots, or you may give some weak liquid manure. Guano is certainly one of the best, but this must be used sparingly; perhaps few persons will be found who will apply it with a sufficiently light hand. April is the best time for removing the old leaves off the plants, for if cleared earlier in the spring, a severe frost, which sometimes occurs in March, cuts off the tender shooting leaves, which otherwise would be sheltered and protected by them.

Strawberry beds must never be dug or forked amongst, for by doing so you destroy a number of fibrous roots, which the plant requires to mature fine fruit, and the soil is also so disturbed that in the fruiting season the hot sun more easily penetrates it, to the great injury of the fruit, for the roots should be kept cool. As a convincing and certain proof of the injury sustained by forking or digging amongst the plants, let me call the attention of my readers to what they must have often observed, though perhaps ignorant of the cause, that however well and abundantly their plants have blossomed in the spring, in the summer, to their surprise and disappointment, they have scarcely produced any fruit.

The method practised by many persons of putting the mowings of the Grass plots round their plants should be avoided as decidedly bad, for if rain should fall however slightly, or even with the natural dampness of the earth, the Grass will mould and taint the berry, and it is better to have the fruit damaged by grit than spoiled by the unpalatable flavour of mould; even the very name of the plant suggests the use of the straw. The proper distance for planting the best and largest sorts is 2 feet each way.

Frogs and toads should be encouraged, for they seek the beds for shade, and feed upon snails, blackbats, and other insects that so frequently disfigure and destroy the finest of the fruit. If a Strawberry grower will observe a frog or toad gape (without doing so himself), he will be convinced at once, by the formation of the reptile's mouth, that it was not formed by nature to injure or subsist on fruit, for more harmless and useful creatures do not exist in a garden. *From Mr. Underhill's Pamphlet on the Cultivation of the Strawberry.*

Home Correspondence.

Dioscorea Batatas.—I have sent a tuber of this Yam for your inspection. I have seen several statements in your columns respecting it, all tending to throw obstacles in the way of those who might next year try the root as an esculent. The paragraph by Mr. Cramb, (p. 517, No. 31), seems, however, to have more sound judgment in it than those of others who have written upon the subject this autumn. On the 3d of March I received one tuber the size of a small garden Pea, which I planted in a pot, and placed in a cold frame, which only had the glass put on in the evening. In this situation it remained until the 12th of May, when the young shoots began to make their appearance. I still kept it in the cold frame until the shoots were about an inch in length, and, as near as I can recollect, the time of planting out was the first week in June. I dug up about 1 square yard of ground on a south border, and mixed in a little rotten leaf-mould; the plant was protected with a hand-glass raised upon bricks for about three weeks; this was all the protection it has received. The frost last night blackened the tops, and I resolved to-day to see how far my misfortune with this tuber agreed with the statements I had already read, when to my astonishment I found that I had broken the root, which in length far surpassed my expectation: the top was about 1 yard in length, and was eagerly consumed by a bull. This statement I think will be sufficient to show that great progress has been made with very slight protection; and I have no doubt that next year I shall be able to present my employer (Lord Waterpark) with a dish of Dioscorea (raised from this one root) in the room of Potatoes. *George Povey, Doveridge Hall, Derby.* [The tuber which accompanied this statement weighed 2 ozs., and measured 13 inches in length and 3½ inches in circumference at the thickest part]——I have had more success than Mr. Salter (see p. 679) with this Yam. I got 30 small tubers of it in spring, the size of Marrowfat Peas, four of which I planted in 5-inch pots in the beginning of March, but without any bottom-heat. When they were a few inches high they were planted out in the open border the first week in May, and two days afterwards they were frosted down, for during all the time of their being out they never had the slightest protection. We have had severe frosts for some nights past, and I have lifted them to-day, when the sizes of the tubers were found to be as follows:—The 1st plant had a tuber 4½ inches long and 1 inch in diameter; the 2d ditto produced one 5¼ inches long and 1 inch in diameter; the 3d was 9 inches long and ⅞ of an inch in diameter; and the 4th was 11 inches long and 1 inch in diameter. Now I am of opinion that a Potato tuber the size of a Marrowfat Pea would not have yielded much more than these Dioscoreas, and looking at the above results I do not entirely despair of success with this plant, although my belief is that it will not succeed in very cold situations. Jedburgh, however, a midland town on the borders of Scotland is not a warm place. *Wm. Deans, Anna Nurseries, Jedburgh, N.B., Oct.* 17.

Orchard Houses.—I congratulate the Horticultural Society on the success of its orchard-house. Allow me, however, to ask the following questions:—1. How were the Plums as to quality? In my orchard-house I find them more or less acid, even when dead ripe. The only exception is Jefferson, which is always sweet both at stone and rind; but even this is inferior in flavour to the same variety out of doors. As to Greengages, I have never had a specimen so luscious as may often be gathered from a wall. 2. Were the Peach trees syringed when the fruit was ripening? This year I left off syringing at that period, in order to improve the flavour of the fruit, but was immediately eaten up with red spider, and compelled to recommence. From observation I am convinced that (*cæteris paribus*) the larger the house the greater the success. A large house has currents of air within itself; besides, in small lean-to houses, there is a sad deficiency of light, from the sides being boarded. It is only in the centre where plants really thrive. For the back, the best plant I find to be the Fig; the best sort the brown Turkey. If a few extra plants are kept in a dark place until the spring is somewhat advanced, then plunged in the open ground under a N. W. wall, (with a canvas covering till May), and brought into the orchard-house after the Figs there have fruited, a second crop may be had in succession from the same space, and the house made to do double duty; as to a second crop from the same plants, I have sometimes had a few, very late and worthless. Late Plums, which were flowered in the orchard-house, turned out and plunged, and replaced in the middle of September, ripen of course under more favourable circumstances than out of doors. I have now a tree of St. Martin's Quetche thus ripening. One great blessing of the orchard-house is that Peaches are not troubled with the green fly, though I cannot say so much for Strawberries. Ought purple Gage Plums to ripen perfectly on a standard near London, but on ground 200 feet above sea level? [Yes.] *S. B.* [No fruit could be of finer quality than that ripened in the Orchard House of the Horticultural Society. The Peach trees were syringed to the *last.*]

Lightning Conductors.—Your correspondent, "who is building a house by the sea," need not apprehend that his high tower will be more likely to be struck by lightning because a metallic weathercock is on the top of it. High buildings are more liable to be struck than those less elevated, and it is a wise precaution to place a continuous metallic path for the lightning from above the highest point of the building down some feet into the earth away from the foot of the tower. If the building lies at any time in the lightning's track it will be sure to follow the metal, and if it be large enough, will pass by it harmlessly to the earth. Excepting that metals afford the readiest passage to electricity—offering it least resistance in its course—it does not appear that they attract lightning so as to bring it where it would not otherwise be inclined to come. A copper wire of given size will convey a larger amount of electricity than one of iron of the like diameter; but if the size of the wire or rod be ample, one metal would form as good a conductor as another. *W.*

Columbia Plum.—At p. 661*c* your correspondent says of this Plum, "it is the worst we have proved, being coarse, and without flavour." In Mr. Rivers's catalogue of fruits I find the same Plum, reported to be "rich and sugary." As we look upon Mr. Rivers as an authority in these matters perhaps he will let us know whether this Columbia and the other American Plums have not turned out as well as was expected. It is not very pleasant to plant a fruit tree, and when it comes into bearing to find the fruit fit for nothing. *A. R.*

Cucumber Growing.—At p. 549 of your paper for August 26th, 1854, 82 very fine Cucumbers are stated to have been obtained from four plants of Evans's Conqueror. This may be very well; but from a last year's plant of Sutton's Berkshire Champion growing in a small two-light pit, 8 feet by 9 feet, the plant occupying but one light, I have cut from May 4 of this year 112 feet of fine fruit, and there are six growing on the plant at the present time that measure 11 feet 2 inches in length. The pit is heated by dung linings only. I cut two fruit the latter end of March from the same plant which measured upwards of 3 feet in length. *Thos. Pollington, Gardener to Wm. Hervey, Esq., Bradwell Grove.*

People's Park, Sunderland.—In your Number for Sept. 26, "J. S." criticises this park unfavourably. "Medicus," (Oct. 6,) comes to the rescue; and as I conceive "J. S." to be in the right, and he has not replied in your Number for last week, I may perhaps be allowed to offer my opinion in the matter. In the first place, it is not a park; the name park gives an idea of some extent, and of a carriage drive at least, but of neither of these can it boast; nor is it a garden. In June it contained one bed of Dahlias; it is in fact a piece of ground which was formerly an old quarry, laid out without taste or judgment; the rubbish heaps are rounded, smoothed, and grassed over to a nicety; the walks are carried along the lowest levels and intersect each other in all directions; beds of nondescript outline are formed here and there. They are similar in size to those generally occupied with bedding stuff, and are planted with Poplars at from 1 to 2 feet apart—such is the people's park at Sunderland. By the account of "Medicus," the inhabitants are, however, satisfied with it; be that as it may, I can only say that they deserve something better, if I may judge from a hasty visit which I paid it one beautiful evening in June, when I was delighted to see crowds of both young and old enjoying themselves so rationally in the pure air of that locality. I understand that 7000*l.* have been already collected for a proposed Crystal Palace; why not expend it on a park worthy of the name? This would be of more real benefit to the inhabitants than a useless and expensive toy. *Hortulanus.*

Stockwood Golden Hamburgh Grape.—I have sent you a small bunch of this Grape for your third opinion of its flavour, although it is now, as you will find, much past its best, while at the July exhibition it was hardly ripe enough. It was in fine condition in August last, but owing to being kept so long this hot autumn its juice has become considerably diminished, leaving the skin thicker than it should be; for when used in season it is a thin skinned variety. I have observed Mr. Reid's remarks in your last week's Number, page 678, and I would ask why does not the person spoken of by Mr. R. exhibit his Grape? I showed the first maiden bunch of mine at the October meeting of the Horticultural Society in 1853, when it was awarded a Certificate of Merit, and the Vice-Secretary spoke favourably of it at that time. Last year it was not shown at all; this season I have exhibited it three times—1st, at the Chiswick July Show, where a large Silver Medal was awarded it; 2d, at the meeting of the Pomological Society, on the 2d of September, when it was highly approved of by all present; and, 3d, at the Caledonian Horticultural Society's Show at Edinburgh, where it received a First Class Certificate, and a very flattering letter on its merits, signed Dr. Balfour. *M. Busby, Stockwood Park, Luton, Beds.* [The Grapes were rich dull cane colour; oval, fleshy, and although not having either a Muscat or Frontignan flavour, deserved all that can have been said in favour of their quality.]

Foreign Correspondence.

Naples, Sept. 6, 1855.—I am now staying in the midst of a wine country, and am therefore in a position to speak of the prospects of the year's vintage, at least in the neighbourhood of Naples. Alas! nothing can be more discouraging; for, instead of luxuriant bunches of luscious grapes, we have nothing around us but foliage which crumbles in the hand, and beads of ashes. It is difficult for a people to whom wine is a luxury to understand the full extent of the distress which is entailed upon this country by the failure of the grapes; but what the Potato disease was to the Irish may the Vine disease be regarded in reference to the Neapolitans. The produce was their meat and drink; their medicine in illness and their comfort in sorrow. With a bunch of grapes and a slice of bread a man formerly made his "merendia," and with a caraffa of wine would undergo as long a fast as your Yankee with a "chew of tobacco." All this, however, is now at an end, and the masses are reduced to lemonades, or to bad spirit—to acid stomachs and tempers, and headaches. As I have paid particular attention to the malady and its remedies, and watched their progress and operation up to the present moment, my observations may be of interest to your readers. I send them, therefore, for what they are worth. Early in the spring our hopes of a good vintage were raised very high — every one was to have "a pocket-full of money and a cellar-full of wine." The trees looked healthier and were throwing out long vigorous branches, so that some almost

thought it necessary to look about them and make ready their casks. About the end of May or June, however, matters put on a different face, and people thought that they had been too sanguine. At all events a half crop might be expected. The fact is that the hot sirocco winds which prevailed about that time began to powder the leaves, which rolled up as if shrinking from the deadly touch, whilst the branches showed an increase of the plague spot. Now was the season of remedies, and the "Giornale delle Due Sicilie," so silent on other matters, was full of quotations from foreign journals recording certain and only cures. Some said that the Vine might be saved by laying it on the ground instead of supporting it by poles; others that the Grapes, as soon as the flowering was over, should be washed with a mixture of sulphur, earth, and water, or with glue much diluted, or that they should be powdered with flowers of sulphur, whilst many contented themselves with the priestly benediction which had been given at Easter. I have tried or seen each one of these remedies, and am therefore in a position to give you something like a correct opinion of the results. They proceeded almost all, as you will perceive, on the supposition that the cause of the malady was external and atmospherical. Especially was this the case in the glue remedy, which was the first I tried. For some time my Grapes looked green and appeared to grow; encased as they were, my hope was that the atmospherical deposit in whatever it consisted could no longer touch the Grape, but as the season advanced the fruit hardened, one side became tainted, and then it burst, and it was a question of time when it would become like a lump of charcoal. Another remedy I tried was that of sulphur, earth, and water, in a mixture of which I dipped every bunch of Grapes; it had been tried in Lombardy and was attended with immense success; not so however in this neighbourhood, though I must confess that whether the result of accident or not, the Vines which were treated in this way were not so utterly ruined as the others. In every bunch there is here and there one of a natural colour, though I do not consider the result sufficiently decided to found any assertion upon. Many are most sanguine as to the advantages of laying the Vines down upon the ground, which is rather a precaution than a remedy, and it cannot be denied that those trees have for a much longer time resisted the malady. Their fruit had kept its colour till the season was far advanced, and had increased in size, though even these had at length succumbed to the universal enemy, and in our knowledge either of the disease or its remedies we are now pretty nearly where we were at this time last year. "*Le vuol' la mano di Dio,*" says the inert Italian; a sentiment which every one is ready to adopt though in another sense, for man seems to know little or nothing on the subject. We are now in the middle of what, from habit, we call our vintage, and a sad sight do the vineyards present. Large pendant bunches all split down the middle, and looking as ashy and blank as Dead Sea fruit. Still they are plucked and pressed, or rather washed, in order to give to water the flavour of the Grape. It is better than nothing—it awakens a reminiscence of the past. In one word, the ruin will be better understood when I say that in a vineyard which four years since produced 10 pipes of wine, this year only 2 barrels are made, and my fortune is attributed to the special interposition of the Madonna della grazie. The consequence is misery to all classes—the peasantry have little work, or what work they have is not paid for; the "colono" cannot make up his rent, and his produce is seized, or his furniture, in part payment; the proprietor in many cases is reduced to beggary, and compelled to sell or mortgage his land to pay the land-tax—this is exacted to the uttermost farthing, blood must be drawn from the very flints; but the overgrown army must be supported, and the legions of *employés* and spies must be paid, though at the expense of suffering thousands. *H. W.*

Sablons, near Moret sur Loing, Seine et Marne, Oct. 12.—Possessing as an amateur grower upwards of 140 sorts of Strawberries I was naturally desirous to try the new "Délices d'Automne." After having in vain endeavoured to obtain plants in Belgium, the nurserymen there declaring that their stock had been disposed of in England, I succeeded in procuring for myself in November, through the kindness of Messrs. Henderson, of St. John's Wood, three plants, which were immediately planted in pots and taken great care of during winter. In April last Mr. Makoy, of Liége, sent me a dozen more and I must confess remarkably healthy runners, with bold crowns, promising consequently a fair crop. Part of them were planted in the open ground and part in pots under glass; but, alas, *not one* of either of the three plants received from London, or of the 12 received from Liége, has produced fruit! One plant in the open ground showed two or three flowers, which, however, did not set. Disappointed, however, as I was, I did not lose courage, but continued my experiments on the plants kept under glass, and which I had a certain right to expect would compensate me in autumn, the more so as they were not allowed to produce a single runner. They had previously been shaken out of their pots and largely supplied with manure-water, but I am sorry to say that they do not give the slightest sign of flowers, whilst several other new sorts—namely, Underhill's beautiful Sir Harry, and Ward's Omar Pacha, yielded a good second crop in September, in spite of their having a considerable number of runners still adherent to them. I may add, too, that neither the plants of Sir Harry nor those of Omar Pacha were by far so strong as the Délices d'Automne, and that the two first named had produced a splendid crop in spring. I now leave it to the public to judge of my surprise in noticing in Messrs. Makoy's autumnal catalogue which I received a short time ago, the Délices d'Automne continued to be advertised as "Perpétuel des Alpes!" *Ferd. Gloede.*

Societies.

Caledonian Horticultural, *Sept.* 8.—In the Fruit competition, the following premiums were awarded, viz.:—Silver Medal, to Mr. Campbell, gr. to J. Johnston, Esq., for Catherine and Royal George Peaches; 2d, Mr. Addison, Gosford, for Noblesse and Red Magdalen. Nectarines: 1st, Mr. Halliday, gr., Scone Palace, with Pitmaston, Orange, and Duc de Tello. Muscat Grapes: 1st, Mr. Stewart, gr., Dalhousie; 2d, Mr. Reid, Ballindean; and 3d, Mr. Strachan, Jardine Hall. Black Hamburgh Grapes: 1st, Mr. Wilson, Leith Walk; 2d, Mr. Blair, Mavisbank; and 3d, Mr. Addison. Frontignan Grapes: 1st, Mr. Lockhart, Arniston, for Grizzly; and 2d, Mr. Addison, for White Frontignan. Highest flavoured Bunch of Grapes: 1st, Mr. Blair, with Chasselas Musquè; 2d, Mr. Johnston, Amisfield, with the same variety. Pine Apple: 1st, Mr. Halliday, Scone Palace, for a Lemon Queen, weighing 5 lbs. and a quarter. Apricots: 1st, Mr. Addison, with Moorpark; 2d, Mr. Edwards, Balbirnie. Plums: 1st, Mr. Edwards, with Goliath, Victoria, and Jefferson; 2d, Mr. Mackie, with Victoria. Highest flavoured Melon: 1st, Mr. Smith, gr. to W. L. Paterson, Esq., with Beechwood; 2d, Mr. Mossman, Thurston, with Bromham Hall Green fleshed. Jargonelle Pears: 1st, Mr. Mitchell, Ravelston; 2d, Mr. Lockhart, Arniston. Gooseberries: 1st, Mr. Smith, Cunnoquhie, with Red Warrington; 2d, Mr. Lockhart, with Hedgehog. The Silver Medal offered by Messrs. P. Lawson & Son, for the 12 best specimens of Lawson's Golden Gage Plum, was gained by Mr. Allison, of Pittencrieff, Dunfermline. Two stands of Hollyhock blooms, placed in competition for the prize of one guinea, offered by Messrs. Downie & Laird, were determined to be equal in merit. The prize was therefore equally divided between Mr. Fowlis, of Woodhouselee, and Mr. Cossar, Kingsmeadows. Mr. Fowlis's stand contained Amandine, Miss Ashley, Pourpre de Tyre, Hon. Mrs. Ashley, Ajax, Isaac Walton, Joan of Arc, Beauty of Beechwood, Felicia, Unique, Criterion, Walden Gem, William Hume, Princess Alice, Rosy Circle, Mont Blanc, Souvenir, and Eugenie. Mr. Cossar had Marquis of Tweeddale, Eugénie, Agricola, Lady Dalrymple, Lady Charlotte Neville, Pourpre de Tyre, Solfaterre, Eva, White Globe, Omer Pasha, Beauty of Tweeddale, Sir David Wedderburn, Lizzy, Prince of Orange, Rosy Circle, Fairy Queen, Shaded Model, and Lord Jocelyn. The prize of one guinea, offered by Messrs. J. Dickson & Sons, for the best 18 Roses, brought two competitors, and was gained by Mr. Pender, Moredun, with the following kinds, viz.:—Camellia, Panaché, Duchess of Sutherland, Phœnix, La Meldose, Charles Raybaud, Safranot, Dr. Arnal, Julia Menout, Old Cabbage, Vicomtesse Decazes, Alexandrine Bechmetoff, Pierre de St. Cyr, La Carnosa, Henry Plantier, Géant des Batailles, Vulcan, Faustine, and Fulgorie. The prize of one guinea, offered by Messrs. Dickson & Co. for the best three Japan Lilies, was awarded to Mr. Lockhart, for Lilium lancifolium album and punctatum. The prize of two guineas, offered by Messrs. P. Lawson & Son to gardeners for the best collection of dissections of the cereal grains, was awarded to Mr. Anderson, Oxenford Castle. In addition to articles for competition, a number of productions were placed on the tables for exhibition only. Dr. Paterson, Leith, sent fine plants of Cissus discolor; J. Renny, jun., Esq., a flowering plant of Yucca gloriosa; Mrs. Fraser, a Myrtle-leaved Orange, with numerous ripe fruit; Asters and Marigolds were shown by Mr. Halley, Mr. Edmond, and Mr. Gemmell, Mr. Melville, Dalmeny Park, sent bunches of the Champion Black Hamburgh Grape; Mr. Mossman, Thurston, a Melon raised from seeds found among the late Dr. Mackenzie's papers received from the Crimea, of small size but good quality; Mr. Thomson, Elton Pine Strawberries. From the nurseries of Messrs. J. Dickson & Sons, were Dahlias, Hollyhocks, and Asters; from Mr. Handasyde, Dahlias; from Mr. Stark, Asters, Marigolds, &c.; from Mr. Tough, a large Hydrangea, bearing 33 heads of flowers; from Mr. Dickson a seedling Dahlia; from Messrs. Sang & Son, Kirkaldy, Asters; from Mr. Chater, Saffron Walden, blooms of seedling Hollyhocks—Empress, Criterion, Fearless, Alpha, and Superb. From the Society's own collection were several fruit trees in pots, particularly a Morello Cherry, bearing 15 dozen well-ripened fruit, and a Pear tree with 43 good sized Pears on it, grown in an orchard house.

Notices of Books.

The Phasis of Matter. By T. L. Kemp, M.D. 2 vols. small 8vo. Longmans; with a geological map and numerous woodcuts.

Dr. Kemp is of opinion that our introductions to chemistry, however admirable they may be, are not what is required by those who merely study the science as a part of general education; and that they are better suited to professional men than to those who like himself only attend to chemistry in common with physiology and other sciences. To use his own words, "chemistry has now become of such importance, that every educated man, to be such, must have a general knowledge of it; and there are a great number of professions and trades, of which medicine, farming, calico printing, or brewing may be instanced at random, which can only be satisfactorily conducted, and be reasonably expected to be improved, by means of chemistry. To supply this numerous class with a manual of chemistry, having a moderate bulk and price, has been my object in writing the following sheets." He is also of opinion that the reason that so very many students of chemistry, certainly the majority, break down in despair long ere they have mastered the subject sufficiently, is partly owing to its being treated so much as abstract matter by itself, and so little in common with the general philosophy of matter.

The volumes before us are intended to illustrate these views, and to offer the reader a system of chemistry adapted to the wants of the general scholar and man of the world. The author commences with the chemistry of the laboratory in its relation to inorganic matter; and thence proceeds to that of the crust of the earth or of geology, treating among other things of British geological formations, which are illustrated by a good map. The next subject is the chemistry of organic matter, which is logically followed by that of life, or of animal and vegetable physiology; and the chemistry of the arts closes the circle.

As far as we can judge, the author has executed his task conscientiously and well. Although it can only be regarded as ancillary to more elaborate treatises, it will be doubtless found extremely useful with that limitation—perhaps the more useful because of it. The style is perspicuous, and considerable tact is shown in distinguishing where to enter into details, and where to cut them short.

As an example of the manner in which the author treats his subject, we may select a part of his remarks upon the sap of plants:—

"The constitution and reaction of the sap of plants are subjects regarding which there is great difficulty and obscurity. Still we are now able to have clearer ideas regarding them than was possible a few years ago. Perhaps the best plan of obtaining a notion regarding them is to consider what takes place in a particular plant, say an Apple tree; and we will suppose that this Apple tree is in the midst of summer, and that (although practically this is absurd) it has flowers, unripe Apples, and ripe Apples upon it.

"The greater part of the wood, bark, and vessels of the Apple tree is composed of cellulose (carbon and water), some albuminous principles (nitrogen, carbon, oxygen, hydrogen, potassa, soda, phosphorus, &c.), and a little oil (carbon, oxygen, hydrogen); the bark also contains chlorophyll (a non-nitrogenous matter); the flowers contain cellulose and wax; the partially ripened fruits malic acid, starch or dextrine, and some albuminous matter; and the ripened fruits, besides the acid and albumen, possess sugar; lastly, upon a crack in the bark there will likely be a little gum.

"We will further suppose that for the last 20 hours the nutritive functions of the plant have been exercised with great activity, that the tree has increased in size, that new cellulose and albuminous matter have been deposited in its structure, new chlorophyll in its bark, that new flowers have been produced, that some of the flowers have passed into unripe fruit, and that some unripe fruits have become sweet, and also that a little more gum has been secreted. All this implies the addition to the tree of a great deal of carbon, nitrogen, oxygen, hydrogen, potassa, soda, phosphorus, &c., all of which have been obtained from the sap. We will last of all suppose (although this is never literally the case) that during this 20 hours the sap has received no additions to it, and has therefore become much diminished in quantity.

"The manner in which the Apple tree would proceed is pretty nearly as follows:—The extremities of the rootlets have no epidermis, and can absorb the soluble parts of the soil; but, in all probability, the manner in which they effect this is by secreting cells, which take up the matter of the soil; and it is likely that fresh cells are developed from germs, until the one most in advance comes into contact with the particular elements which the sap requires, in order to restore it to its perfect state. At least this appears to be the only manner in which the selecting power of the rootlets (which power certainly exists) can be explained. The cells having acquired what is needed, are taken into the sap at the extremity of the root.

"The substances thus taken into the sap, along with water, are probably apocrenate of ammonia, nitrate of ammonia, carbonic acid, the product of the conversion of humic acid into apocrenic, and (but in very small quantities) silicates, sulphates, phosphates of potassa, soda, magnesia, lime, and oxide of iron, and chlorides of potassium, sodium, and magnesium.

"Whenever these salts, however, enter the sap, the chemical affinities fall into utter abeyance, and new compounds are formed. The apocrenic acid (and the carbonic, along with some water) furnishes dextrine, which is the base of sap, and the nitric acid and the ammonia form albuminous compounds, to which the potassa, sulphur, &c., attach themselves. Of the manner in which the elements of the soil so arrange themselves as to form the compounds of the sap, an explanation cannot, perhaps, in the present state of our existing knowledge, be given. It may, however, be said, that it is a vital one, and not one of chemistry. Chemical affinity is that tendency to motions of different elements when placed near together, and when not under the influence

of life. Vital affinity entirely supersedes this affinity, and produces new motions of her own, one of the results of which is new products and new compounds.

"The sap of our supposititious Apple tree thus recruited begins to ascend the trunk until it reaches the leaves; it passes along the vessels, probably also from cell to cell, but most abundantly through the alburnum. A portion of its water is exhaled through the bark, but when it arrives at the leaves a still greater quantity of water is cast off, and also at the surface of the Apples. Another very important change takes place at the leaves, and a large quantity of carbonic acid is taken into the sap from the atmosphere, and oxygen is evolved. This last phenomenon will be considered in Chap. III., on Respiration. The sap, now in a state of full perfection, then flows to all parts of the tree; to the bulk of it the dextrine supplies its cellulose, and its albumen the albuminous principles. The dextrine yields chlorophyll to the leaf, wax to the flower, malic acid to the immature Apple, sugar and albumen to the ripe ones, and at a crack in the bark the dextrine is converted into gum. The probable manner in which these transformations take place will fall to be considered in the Chapter on Nutrition. Lastly, the exhausted sap descends the tree to be recruited by fresh supplies at the root.

"That the above account of the course of the sap and of its supplies is the correct one is certain. That apocrenate of ammonia and saline substances are taken from the soil by vegetables in ordinary cropping, is now by British chemists nearly unanimously believed. The farmer is continually adding them to his soil, and yet his soil does not increase in quantity. Nay, sometimes when he manages unskilfully and overcrops, he abstracts these so rapidly, that there is not enough of them left to supply the sap of a full crop, and his land becomes 'out of heart.' Then while we see that the sap acquires the apocrenate of ammonia, &c., from the soil, we see the vegetable increase in cellulose, albumen, sugar, acids, &c. (all substances that contain the same elements as the apocrenate of ammonia and the like); although we cannot understand how it comes about, that in the organism they are arranged differently; and, further, there is no other source from which the plants can derive these principles that form their bulk save from those indicated. Then, that the leaves take carbonic acid from the atmosphere, give out oxygen, and also water, and that the sap ascends and descends in the manner described, are all easily demonstrated by actual experiments, all of which will be found described at length in books upon botany.

"In order that the sap may circulate in plants, both heat and light in considerable intensity must be present. When both these influences are acting strongly, as in spring and summer, the circulation of the sap is performed with great force and vigour. If, for example, a Vine (in spring) be cut across, and a piece of bladder tied over the stump, the bladder soon becomes tightly distended by the ascending sap, and ultimately bursts.

"The causes of the flow of the sap belong to physiology, and in a work of this kind can only be hinted at. Organic structures have a peculiar power of contractility upon being touched by various agents or stimulants. Thus, as we shall immediately see, the hollow muscle called the heart of the higher animals when blood enters it contracts, and by force of that contraction propels the blood. Nothing like a heart exists in any vegetable; but in the highest or vascular plants, such as our Apple tree, the vessels *may* contract upon their contents and assist in propelling the sap. But their influence in this manner is probably extremely slight, and the movements of the sap in the higher plants is nearly, as in the lower it is entirely, dependent upon vital affinities and attractions that exist between the sap and the various structures of the plant through which it flows. Just as the apocrenate of ammonia, whenever it enters the sap, loses its chemical properties and becomes converted into dextrine and albumen, so this dextrine and albumen is not obedient to the ordinary laws of gravitation, and flows in directions altogether different from those which it would do were it mere dead matter."

In a similar manner the circulation of the blood in animals is treated of.

We content ourselves with one more extract on the subject of Brewing:—

"This process essentially consists in converting the starch of malt into sugar, and then in converting this sugar, and also the sugar that already exists in malt, into alcohol. The latter of these changes is effected by the catalytic action of modified gluten or yeast, as it is commonly called; and the former by the diastase. In practice it is necessary not to apply too high a temperature, for fear of converting the starch into dextrine.

"The first step in the process is to get a solution of sugar. To do this the malt is ground, and successive quantities of water of a temperature of from 157° to 160° are poured upon it; and the lower temperatures ought to be begun with first. By so acting the sugar is obtained in solution, and then the starch and diastase are procured; and the reason that a higher temperature than 160° is to be avoided, is the fear of converting the starch not into sugar, but into dextrine.

"These processes of infusing the malts are technically called mashings, and various mechanical contrivances are arranged in the mash tub which do not here concern us.

"When as much sugar as possible has been obtained by the mashing, the saccharine solution, or wort as it is called, is boiled for a considerable time; three purposes being served by the boiling; 1. The solution is concentrated, a quantity of water being driven off in vapour; 2. A great portion of the albuminous matter is coagulated, and hence the chance of the beer afterwards running on to the acetous fermentation diminished; and, 3. What little starch there is left is converted into dextrine, and a purer solution of sugar obtained.

"For a long time past it has been usual to add Hops during this boiling process. The common opinion is that they prevent the beer from running on into the acetous fermentation; but this is probably quite without foundation, for beer was made in the country which kept well enough hundreds of years before Hops were introduced. The real action of the Hops is probably to communicate a bitter and aromatic flavour.

"It is found in practice that the best beer is made when the time that elapses between the boiling and the addition of the yeast to excite fermentation is least. The reason of this probably is, that when the period is long, some of the saccharine and albuminous proximate principles begin to react upon one another. The cooling is generally effected by means of evaporation, and for this purpose the boiled wort is spread out into shallow coolers, so as to expose as large a surface as possible to the air. As March and October are the two months during which in general evaporation goes on more rapidly than even in colder weather, March and October-made beer have long been famous.

"The reason that the wort must be cooled before the yeast that is intended to act catalytically is added, is that yeast is destroyed by a temperature much above 85°. A temperature of about 60° seems in general to be preferred. The yeast is then mixed with a quantity of wort, and this mixture next carefully stirred among the whole wort. The structure of yeast is seen in *fig.* 140. It consists of little, apparently vegetable, cells filled with albuminous matter taken from previous malt, and which in the process of fermentation throw out new cells that fill themselves with albuminous matter contained in the present malt, and at the same time catalytically resolve the sugar into alcohol and carbonic acid, the latter of which passes off as gas.

"The fermentation lasts for some days. The greater quantity of the newly formed yeast rises to the surface, and has a very light appearance, owing to its being permeated with globules of carbonic acid gas. Another portion, however, falls to the bottom of the vessel in which the process is conducted. The fermentation is known to be finished by testing the specific gravity of the fluid, and on the small scale by observing that carbonic acid is no longer given off. When this is the case, the yeast is skimmed off, the beer removed from the bottom yeast, and any albuminous matter that may still remain among the beer removed by means of isinglass. The beer is then ready to be barrelled.

"It is obvious that any saccharine matter, or any starchy, if diastase be present, is capable of being converted into beer, as sugar, Potatoes, raw grain, or a mixture of any such with malt.

"Wine-making in no respects differs in principle from beer-making. The sugar is contained in the ripe juice of the grape, and the ferment in the gluten of the skin. The ferment of Apple also in cider-making is the albuminous principles contained in the Apple.

Garden Memoranda.

Mr. Turner's Royal Nursery, Slough.—Since we last visited this establishment considerable improvements have been effected. Three new houses are now in course of erection, each of which is 49 feet in length, and 11 feet in width. These are for the accommodation of soft-wooded plants, for which they appear to be admirably adapted, being low, well ventilated at the top, and with walks up the centre. One boiler placed at the end of the centre house is to heat the three. Two other houses have also been considerably lengthened and several new ranges of pits and frames erected. In forming new frames Mr. Turner takes great care to secure a dry bottom for them, which is so essential to the well doing of plants in winter. In constructing them the soil is excavated to the depth of 15 or 18 inches, not only within the walls, but to a distance of 2 or 3 feet beyond them, and this space is filled up with coarse gravel, at the same time taking care that the bed of the frame is still above the level of the surrounding ground. This is a precaution that cannot be too strongly insisted on, as more plants are killed in winter from the effects of damp than from frost, and it is surprising how great an amount of frost many plants will endure that are supposed to be somewhat tender when they are kept dry and free from damp.

We observed that in one instance a branch pipe (with stop-cock) from the boiler of one of the houses also heated a range of frames in which Cinerarias and other plants are here wintered and grown in that manner which otherwise would require the temperature of a greenhouse. Three ranges of frames, consisting of 96 lights, are now occupied with Carnations and Picotees in small pots, Mr. Turner being a most extensive grower of these plants, having bloomed this season about 2000 pots of them. Pelargoniums are also largely cultivated here, seven houses being devoted to their growth; the specimen house is now filled with fine plants in their blooming pots. Pelargoniums, both young plants for sale and specimens, are encouraged to make as much young wood as possible early in autumn, in order that the plants may ripen it early in spring instead of having to make it then, and by this means an early and vigorous bloom is insured. Not only in the Pelargonium houses, but in all the others we noticed that spacious tanks were constructed underneath the stages, into which all the rain-water falling on the roofs is conveyed by means of gutters and pipes, so that during winter a constant supply of soft water is always at hand, and that too of a temperature nearly similar to that of the house itself. The houses throughout are in excellent condition, most of the glass being quite new, three houses having been reglazed this summer, as well as several ranges of frames, a fact which shows the importance attached to good glass in an establishment like this, where first-class cultivation is the object aimed at. In addition to the collections of large flowered and fancy varieties of Pelargonium, variegated kinds are largely grown in this nursery, and among them we particularly noticed a new variety named Alma, which may be regarded as a considerable improvement on Flower of the Day, having better foliage and bright scarlet flowers. Shrubby Calceolarias are also grown here, and among them a row of Purity was in full bloom; as a bedding variety this is doubtless one of the best, and plants struck during the previous summer are evidently the most desirable for this purpose; in some cases it would be better, however, to plunge the plants in their pots, so as to prevent an exuberance of growth, and thus ensure an earlier bloom. Mr. Turner intends cultivating this class of plants somewhat largely for conservatory decoration, as he considers them more ornamental than the herbaceous varieties, and they remain longer in bloom. Chrysanthemums, which are grown here in pots as well as in the open ground, will soon be in full flower. Cinerarias have just received a shift, and are in vigorous health. The latter, as we have already observed, are wintered in dry frames, heated by hot-water pipes, led along just inside their front walls.

Of Verbenas we observed some still in good condition. Wonderful, a rich plum coloured variety, with a large white centre, was very fine, as was also Tyrian Prince, which appears to be the best purple for bedding. Loveliness, a bright rosy pink kind, is likewise an excellent bedding variety, and Blue Bonnet is the best of its colour for beds we have yet seen. Glory of France has handsome flowers, which are also remarkable for fine shape.

Dahlias were past their best, the heavy rains and cold nights we have lately had having greatly impaired their beauty. Among seedling varieties we noticed Miss Burdett Coutts, a useful shaded buff and violet flower; Lollipop, pale buff; Bessie and Yellow Beauty, two fine varieties of different shades of colour; and Grand Sultan and Tyrian Prince, two good and dissimilar dark kinds.

Pinks, we need scarcely say, are grown here in great quantities, and the plants in the blooming beds are very strong. The beds are elevated fully 9 inches above the paths, so as to avoid a superabundance of moisture in winter. This plan, we observed, is also practised in the case of Pansy beds, and it is doubtless one of great utility, tending, as it must do, to prevent the plants from damping off.

It may be worthy of mention that in one of the new houses already adverted to the side shelves were formed of cross bars of wood covered with slates, over which was placed a layer of cement and coarse sand. On this again was laid another layer of Portland cement. Shelves constructed in this manner have been found to be not only very durable, but to add greatly to the neat appearance of the house. The pathways are also to be formed of Portland cement.

FLORICULTURE.

National Floricultural Society.—With the meeting of October 4th the season, as far as florists' flowers are concerned, may be said to have virtually closed, as few more seedlings may now be expected to be exhibited this year. The success which has attended the society's efforts was perhaps most apparent at the meeting of Sept. 20th, when no less than 39 varieties of seedling Dahlias were exhibited, from three to nine blooms of each variety being staged, but it is only fair to state that the whole of the meetings during the season have been very satisfactory. On the 20th Sept., cut specimens of variegated Geraniums were exhibited by Mr. Kinghorn; of these the best was General Pelissier, a variety in the way of Commander-in-Chief, but very much better, and as a bedding plant, a valuable acquisition. Of the following seedling Dahlias, it was decided that they maintained the character previously given to them when they obtained certificates, viz.:—Enchantress (Alexander) a striped fancy variety; Bessie, a full-sized yellow: Lollipop, a very constant and fine fawn-coloured variety; Miss Burdett Coutts, shaded salmon, and very constant; Mrs. Wheeler, a first-rate crimson scarlet; and Reginald, primrose, slightly tipped with purple. A First Class Certificate was awarded to Mr. Keynes for Orange Perfection, a shaded orange flower of beautiful outline and smooth petal. Mr. Turner received a Certificate of Merit for Duchess of Wellington, soft creamy French white, very double, full, and of good outline and close high centre. This is a novel flower, and a great acquisition. Six blooms each were shown of the above two flowers. Mr. Turner also received a Certificate of Merit for Grand Sultan, dark maroon, approaching to black, a desirable kind. Mr. Rawlings received a Certificate of Merit for Chameleon, yellow, occasionally tinged on the edges of the petals, and a full-sized flower. Mr. Wheeler, of Warminster, sent Eclipse, a medium-sized dark purple flower, having a close high centre; and Lady Raglan, a buff kind, but as shown, too much open in the petal. Colonel Eyres, of Thurlston, Surrey, sent three blooms of a light purple, a very round high-centred flower, with small stout petals, but rather small. The 1st prize for 12 Dahlias was awarded to Mr. Turner, for Robert Bruce, Yellow Beauty, Pre-eminent, Empress, Lord Bath, Sir C. Napier, Rachel Rawlings, Espartero, Lollipop, Bessie, Miss Spears, and Annie; 2d, Mr. Keynes, with Pre-eminent, Duchess of Kent, Lord Bath, Goldsmith, Duetche, Rachel Rawlings, Robert Bruce, Essex Triumph, Salvator Rosa, Triumphant, Annie, and Ruby Queen. Both these stands consisted of flowers fine in quality. Six Fancy Dahlias: 1st, Mr. Turner, with Empereur de Maroc, Triomphe de Roubaix, Gloire de Kain, Admiration, Flora M'Ivor, and Baron Alderson; 2d, Mr. Keynes, with Baron Alderson, Triomphe de Roubaix, Gloire de Kain, Elizabeth, Nancy, and Pigeon; 3d, Mr. Robinson. A stand of six splendid blooms

of that very fine Dahlia Pre-eminent was exhibited by the raiser, the Rev. C. Fellowes, of Shotesham Rectory, near Norwich.

Oct. 4th.—Mr. Dean in the chair. Messrs. Veitch & Son received a Certificate of Merit for a new Fuchsia, named Pendulina. It looked as if it would make a good late blooming conservatory kind, and as it flowers well in a dwarf state, it will form a pretty pot plant. It has long slender flowers, of a peculiar rose shade. A Certificate was also awarded to Mr. Turner for Dahlia Col. Windham, deep rose, with a small bronze tip. It is a full deep flower. The same award was also made to Turner's Tyrian Prince. The same exhibitor likewise sent several blooms each of Seedling Dahlias shown on former occasions which have taken certificates, namely, Bessie, Lollipop, Miss Burdett Coutts, Duchess of Wellington, Yellow Beauty, Shaded Model, and Grand Sultan. Mr. Shrimpton, of Thame, Oxon, sent a light Verbena, of large size, but not otherwise remarkable.

Dahlia and Hollyhock Exhibition at Edinburgh.—In our report of this show last week it was omitted to be stated that Mr. Bircham, of Hedenham, obtained Certificates of Merit for seedling Hollyhocks Miss Nightingale, a pale lemon variety, and Mrs. Oakes, a light buff kind, which produces a large and close spike. Mr. Turner, of Slough, also sent from three to twelve blooms each of six fine seedling Dahlias, viz.:—Bessie, Lollipop, Tyrian Prince, and Yellow Beauty, to all of which First Class Certificates were given; and a Certificate of Merit was awarded t Lord Palmerston. Mr. Turner also exhibited blooms of Miss Burdett Coutts, a useful and distinct flower. A Certificate of Merit was awarded to a seedling Hollyhock named Rubens, exhibited by Mr. Laing, of Dysart.

Miscellaneous.

The Cherry.—We fully concur with Prof. Targioni in his conviction that the wild Cherry (Prunus cerasus), common in the woods of Italy and other parts of Europe and Asia, is the mother plant of all the kinds of that fruit now in cultivation, in opposition to many modern botanists, who follow De Candolle in distinguishing four species, Cerasus avium, C. duracina, C. Juliana, and C. caproniana, or even go far beyond him in their multiplication. The species is also evidently indigenous, notwithstanding Pliny's statement that there were no Cherries in Italy before the victory obtained over Mithridates by Lucullus, who was the first to bring Cherries to Rome in the year of Rome 680, and that within 120 years after that, they were spread over the empire as far as Britain. This statement gave rise to the tale that Cherries originally came from Cerasunte, now Zefano, and were therefore called Cerasus by the Latins. Lucullus may, however, have first imported the cultivated varieties, which the Romans may not have recognised as identical with the wild Cherry. In Greece, Cherries were certainly known long before his time, for Diphilus Siphnius, according to Athenæus, mentions them under the Government of Lysimachus, one of the Dukes of Alexander the Great. Among he numerous varieties of Cherries of modern days, Pliny records only eight, of which the Juliana, according to Matthioli and Micheli, is the acquaiola of modern Italy, and the Ceciliana, according to Micheli and Gallesio, is the visciolona, believed to have been brought from Arabia into Spain, and thence to Rome. The varieties known in modern Tuscany are chiefly due to the exertions of the Grand Dukes of the Medici family. Micheli, in the catalogue already quoted, enumerates 47 sorts, and Castello has figured 93. The double-flowering variety was first introduced into the gardens of Florence, by Giuseppe Benincasa Fiammingo, curator, under Francis I. of Medicis, of the Botanic Garden then called delle Stalle, afterwards dei Semplici. The Cherry-tree, especially of the Bigarreau variety, grows to a very large size; one is recorded on the shores of the gulf of Nicomedia, of which the circumference of the trunk was 4½ braccie (about 9 feet), and Prof. Targioni himself had one cut down in his own podere, which was beginning to decay, and had a trunk of 8 feet in circumference. *Journal of Horticultural Society.*

Calendar of Operations.

(For the ensuing week.)

PLANT DEPARTMENT.

Conservatory, &c.—Now that the out-door display is much faded, every effort should be made to render this and all the other plant-houses as attractive as possible, and perhaps nothing tends more to effect this than orderly arrangement, and keeping everything perfectly clean and neat; and if cleanliness and order are properly attended to, they will do much towards compensating for any deficiency of fine specimens in flower, and will greatly enhance the appearance of such things as may be in bloom. There is no good reason, however, why there should be anything like a scarcity of plants in flower at present, for although we cannot command as fine a display now as earlier in the season, there is plenty of showy things which may be had in bloom at this season, and with sufficient accommodation, &c., it is easy to have this house well furnished with showy plants in bloom. Where Camellias were grown in heat early in the season these will be now coming into flower plentifully, and will be invaluable at present when but few first-rate hard-wooded plants are in bloom, and these if allowed a fair period of rest after setting their buds may be forced at almost any season, but unless there is a large stock they should not be drawn upon too largely, until the Chrysanthemums are over. The sweet Indian Daphne is also easily had in bloom at this season, and tree Carnations, which when well done are very showy plants, may be had in great perfection, and these should be grown rather largely if for their fragrance only, and they are also exceedingly useful where there is a demand for cut flowers. To these, add the gay Salvia splendens, and Gesnera zebrina.

FORCING DEPARTMENT.

Pineries.—Use sufficient fire-heat to allow of admitting a little fresh air when the weather is moderately warm, and maintain a moist state of the atmosphere, but avoid heavy syringings or letting condensed moisture fall into the hearts of the plants, which sometimes happens when the atmosphere is kept very moist and is very injurious to the plants. The plants expected to show fruit shortly after Christmas should be allowed to get rather dry at the root, keeping the atmosphere also rather dry where this can be done without injury to other portions of the stock, in order to get its growth thoroughly matured; for unless this is attended to there will be no certainty of getting them to fruit at that season; and indeed the general stock of plants intended for fruiting next spring, if sufficiently strong, should now be kept rather cool and dry. But where the plants are not considered sufficiently strong, they may be safely kept growing for some time longer, with the exception of such as may be intended to furnish ripe fruit early in May. Vineries.—Make sure that the wood of young Vines is thoroughly ripe before throwing the house open or occupying it with plants that would interfere with the proper treatment of the Vines, and until the wood is properly ripened use brisk fires with a moderate circulation of air, for there will be no chance of getting them to break strongly next spring unless the wood is well ripened, and this cannot be effected after this season without fire-heat. And what with plant growing for indoor decoration, and wintering bedding-out stuff, both of which is carried to a greater extent about many places than there is proper accommodation for; there is often some difficulty in finding room for plants at this season, and these are in many cases placed in Vineries, &c., and the Vines very improperly treated. Where employers are agreeable to make Vines a secondary consideration to plants this may be all very well; but where this is not the case nothing should be allowed in Vineries which would at all interfere with the proper treatment of the Vines. Get the Vines pruned where the wood is thoroughly ripe, and the house cleaned, well washing the paint, &c., when the house may be used for storing Geraniums lifted out of the flower garden, or any other plants which merely require to be protected from frost; but see that everything is perfectly clear of insects before bringing it here.

LOWER GARDEN AND SHRUBBERIES.

What with falling leaves and the tiresome diligence of the worms, much labour is necessary to keep lawns, &c., clean and neat at this season. There is, however, no help for it but a diligent use of the broom and roller. Continue to mow as frequently as may be necessary to keep the Grass short, for much time is lost in clearing up leaves when the Grass is allowed to get long; also keep the surface hard and smooth by frequent rollings with a heavy roller. This is a capital season for laying down turf, aad where levelling may be necessary, or any other alterations involving taking up and relaying any breadth of turf, this should be attended to as soon as possible, for besides that there will be no trouble with turf laid now in the event of dry weather setting in early next spring, such work can be done more economically now and with much more comfort to the workmen than after cold winterly weather sets in. Nothing adds more to the comfort of a garden in winter than hard dry walks, and where these incline to be soft and greasy, a thin sprinkling of clean rather rough gravel, put on when the walks are wet and well rolled in, will be found to greatly improve them, and this at a very trifling cost. Keep the surface hard by frequent rollings, which will cause the water to run off to the edges, instead of draining through the gravel, as is the case when the surface is allowed to become soft and spongey. Continue to clear the beds of their summer occupants, as these become shabby, and replant them with spring flowering things. But where the soil wants renewing this should be done before putting in the spring flowering things, for it is generally a busy season when these are removed, and nothing should be left to be done then which can be done now. Plants which it may be desirable to lift and winter for use next season again, cannot be safely left out any longer, except where they can be covered in the event of a sharp frost occurring suddenly. And specimen Fuchsias, Geraniums, &c., should be got into safe quarters immediately frost is apprehended.

HARDY FRUIT AND KITCHEN GARDEN.

Examine the stock of fruit in the fruit room as frequently as circumstances will allow, and remove any infected with decay at once, and keep the room cool and dry. Where it is intended to plant any quantity of fruit trees this season the preparation of the ground, &c., should be proceeded with as expeditiously as possible while it is in good working order. And too much attention can hardly be bestowed on the preparation of ground intended to be planted with fruit trees. Be particularly careful to secure perfect drainage, for a well-drained soil is essential to fruitfulness in all kinds of fruit trees, and it is worth while to secure this even at a considerable expense. Where the natural soil is not of a good quality for the kind of trees to be planted, this should be partly removed, replacing it with some good fresh turfy loam. Avoid the use of rich stimulating manures, which do more harm than good. Carrots, Parsnips, Beet, &c., should be lifted when the ground is in good order, and stored for winter use in a dry cool place; stack them in sand to preserve them from shrivelling, &c. Spring Broccoli that may be growing very rank should be laid down with the heads to the north, which will check the over-luxuriant growth, and afford a better chance of its standing a severe winter. In the event of sharp weather being apprehended, a quantity of the most forward Lettuce should be placed under glass, and Cauliflowers that are heading should also be removed to where they can be protected from frost.

STATE OF THE WEATHER AT CHISWICK, NEAR LONDON,
For the week ending Oct. 18, 1855, as observed at the Horticultural Gardens.

Notices to Correspondents.

Australian Seeds: *Novice.* Sow them next spring in a shallow pan filled with light soil, and place them in a frame or pit on a gentle bottom heat. When strong enough pot them off. Seeds of the Pampas Grass may be treated like the above, but as soon as the weather has become sufficiently warm next summer they should be planted out in the open border.‡

Diseases: *H M G* (Cork). The affection on the Grapes you have sent resembles that figured at p. 676, 1854, and may possibly be a state of the same thing. No fungus is, however, at present formed in the spots, nor is there any mycelium. The central cells are quite gorged with brown matter, and the walls of the outer cells are much discoloured. It is impossible to say what is the cause of the malady, nor can we suggest any remedy. As one variety of Vine alone is affected you should direct especial attention to the conditions under which it is placed, and to the state of the roots. Perhaps the guano you have administered may be in fault. *M. J. B.*

Gas Stoves: *G O L.* These have been made by applying a jet of gas to a vessel containing water, which is thus made to circulate through pipes in the usual way. But it is found in practice so difficult to prevent the gas deteriorating the atmophere of the plant house, that we know no one who now employs such stoves.

Gigantic Balsams: *A Traveller* must authenticate his statements by repeating them with the addition of his name and address. We cannot accept statements as facts upon the faith of unknown correspondents.

Names of Plants: We have been so often obliged to reluctantly decline naming heaps of dried or other plants, that we venture to request our correspondents to recollect that we never have or could have undertaken an unlimited duty of this kind. Young gardeners, to whom these remarks more especially apply, should bear in mind that, before applying to us for assistance, they should exhaust their other means of gaining information. We cannot save them the trouble of examining and thinking for themselves; nor would it be desirable if we could. All we can do is to *help* them—and that most willingly. It is now requested that, in future, not more than four plants may be sent us at one time.—*J G.* The fragments you have sent *may* belong to Madaria corymbosa.—*M C.* Pteris serrulata. *S.*—*Hythe.* Æschynanthus grandiflorus.—*L.* Francoa ramosa; but there is, as so constantly happens in gardens, a mistake about its origin. It is from Chile, not China; and was introduced long before Mr. Fortune went to China. The Francoa appendiculata with rosy blossoms is much handsomer. It wants a cool greenhouse in winter, and plenty of warmth, air, and water in summer.

Names of Fruits: *O Y.* The Sanguinole Pear.—*Sempervive.* 1, Beurré Diel; 2, Napoleon; 3, Ne Plus Meuris; 4, Marie Louise; 5, Passe Colmar; 6, Easter Beurré.—*Constant Reader.* 1, 3, Manks' Codlin; 2, Devonshire Buckland; 4, Round Winter Nonsuch.—*T W B.* Not the Beurré d'Amanlis, but a remarkably fine specimen of the Doyenné Blanc.—*S B.* The Jersey Gratioli which you sent, grown at 200 feet above the level of the sea, was certainly not so sweet as it is generally in a good climate and season. It had a slight acidity; but notwithstanding we found it possessed a rich flavour.—*J. C. Reigate.* Pears:—1, Flemish Beauty; 2, Beurré Diel; 3, St. Germain; 4, Beurré Rance; 5, Beurré de Capiaumont; 6, Aston Town; 7, Marie Louise. Apples:—1, Reinette du Canada; 2, Hollandbury; 3, Fearn's Pippin; 4, Blenheim Pippin; 6, Scarlet Nonpareil; 7, Beauty of Kent; 9, Reinette du Canada; 10, Lamb Abbey Pearmain; 11, Norfolk Beaufin.—*Anon.* 1, Roman Apricot; 2 and 3, Gallande Peach; 4, Kirk's Plum; 5, Grosse Mignonne Peach; 6, Jefferson Plum.—*J C.* Unknown; handsome, but worthless. A 1, Manks' Codlin; A 2, Hawthornden; A 4, Round Winter Nonsuch.—*R B.* 1, Chaumontel: 5, Napoleon; 7, Thompson's; 8, Beurré de Capiaumont. The others in their present state are indeterminable.—*L C D.* 4, Hawthornden. The others were imperfect, and therefore not in a fit state to be named.—*A B.* Pears:—2, Brown Beurré; 3, Doyenné Blanc; 4, Bishop's Thumb; 5, Glou Morceau; 6, Crassane; 7, Old Colmar; 8, Glou Morceau; 9, Chaumontel; 10, Louise Bonne of Jersey; 11, Comte de Lamy; 12, Chaumontel; 16, Marie Louise. Apples:—1, Carlisle Codlin; 2, Manks' Codlin; 3, White Colville; 6, Sam Young; 7, like Christie's Pippin; 8, Margil; 9, Carlisle Codlin; 10, Dutch Mignonne; 12, Old Nonpareil; 14, Ribston Pippin. The numbers attached to these fruits were so indistinct as in some instances to be scarcely legible. The specimens not named were indeterminable.‖

Orchard Houses: *Sub.* The span-roofed form is doubtless by far the best.‡

Stanwick Nectarines: *J J.* Your specimens, which you state were ripened in the open air with the assistance of a light placed before the tree for the last six weeks, were small and worthless.‡

The Durmast Oak: *Diss.* We confess our inability to answer your question. It was formerly believed, and that belief was strengthened by the statements of the late Mr. Atkinson, that the Durmast Oak was Q. sessiliflora. But more recent inquiries throw some doubt upon the point. As to the Durmast Oaks sold some years since at Southampton, they proved to be invariably the common Q. pedunculata, as we happen to know from having purchased a lot of young plants. We very much wish some correspondent residing in the New Forest would send us twigs in leaf of what is now understood to be the Durmast.

Worms: *Alpha.* The best remedy for these is lime water, which is made by pouring water over fresh-burnt lime, allowing the latter to settle to the bottom, and then using the water in a clear state.‡

PERUVIAN GUANO, Bolivian Guano, Superphosphate of Lime, Nitrate of Soda, Sugar Scum, and every description of Artificial Manures, Linseed Cakes, &c.
Wm. Inglis Carne, 10, Mark Lane, London.

THE FOLLOWING MANURES are manufactured at Mr. Lawes' Factory, Deptford Creek:—Turnip Manure, 7*l.* per ton; Superphosphate of Lime, 7*l.*; Sulphuric Acid and Coprolites, 6*l.*—Office, 69, King William Street, City, London.

N.B. Genuine Peruvian Guano, guaranteed to contain 16 per cent. of ammonia. Nitrate of Soda, Sulphate of Ammonia, and other Chemical Manures.

THE LONDON MANURE COMPANY'S NITROPHOSPHATE OR WHEAT MANURE FOR AUTUMN SOWING.—This Manure, composed of blood, animal matter, and dissolved bones with silicates, is most strongly recommended to the notice of Agriculturists. It contains from 7 to 8 per cent. of nitrogen, in a form yielding ammonia by slow decomposition, and is therefore particularly adapted for Wheat. The quantity required is 2 to 3 cwt. per acre drilled in with the seed. Price, per ton, 7*l.* 10*s.* in London.

PERUVIAN GUANO, FISHERY SALT, and every other MANURE on best terms, strictly warranted.
40, Bridge Street, Blackfriars. E. Purser, Sec.

SEWAGE CHARCOAL MANURE.—This highly fertilising Manure, which is Peat Charcoal completely saturated with London Sewage, will be found most efficient for every species of crop; more especially for Peas, Beans, Turnips, Mangold Wurzel, and other root crops. It will produce a greater return for the outlay than Guano or any other Manure at an equivalent value: it also possesses the property of retaining its fertilising power longer than any other Manures now in use. It may be obtained at the SEWAGE MANURE WORKS, Stanley Bridge, Fulham, at 4*l.* per ton, and in quantities less than half a ton, at 5*s.* per cwt., for ready money only; and in quantities not less than a ton, will be delivered at the London Termini of the Railroads free of charge for cartage. No charge for sacks.

It may also be had from Messrs. G. Gibbs & Co., 26, Down Street, Piccadilly, Agricultural Seedsmen, Agents for London, and from all the other Agents of the Company.

ARTIFICIAL MANURES, &c.—Manufacturers and others engaged in making ARTIFICIAL MANURES may obtain every necessary instruction for their economical and efficient preparation, by applying to J. C. Nesbit, F.G.S., &c., Principal of the Agricultural and Chemical College, Kennington, London. Analyses of Soils, Guanos, Superphosphates of Lime, Coprolites, &c., and Assays of Gold, Silver, and other Minerals, are executed with accuracy and dispatch. Gentlemen desirous of receiving instructions in Chemical Analyses and Assaying, will find ample facility and accommodation at the College.

DRAINING BY STEAM POWER.

JOHN FOWLER is prepared to undertake Contracts for DRAINING LAND by his PATENT STEAM PLOUGH, at prices varying, according to depth and distance, from 3*l.* to 5*l.* 10*s.* per acre, inclusive of tiles, main drains, and all other expenses. Contracts executed with great rapidity, and tiles manufactured on the spot, where suitable clay exists.—Temple Gate, Bristol.

THE GENERAL LAND DRAINAGE AND IMPROVEMENT COMPANY
Incorporated by Special Act of Parliament.
Offices, 52, Parliament Street, London.
Directors.
Henry Ker Seymer, Esq., M.P., *Chairman.*
Sir John V. Shelley, Bart., M.P., *Deputy-Chairman.*

George Thomas Clark, Esq.	William Fisher Hobbs, Esq.
John C. Cobbold, Esq., M.P.	Edward J. Hutchins, Esq., M.P.
Sir William Cubitt, F.R.S.	Sir S. M. Peto, Bart.
Henry Currie, Esq.	William Tite, Esq., M.P.
Thomas Edward Dicey, Esq.	William Wilshere, Esq.

Empowered to execute Drainage, Road-making, and other Land Improvements, and to Erect Farm Buildings upon Estates under Settlement, Mortgage, or otherwise; or Church property, and without investigation of Title to charge the whole outlay and expenses upon the Estate, to be repaid by instalments spread over any period determined by Landowners within the limits of 50 years for Drainage and Roads, and 31 years for Farm Buildings.

Landowners may arrange with the Company for the execution of the works by their own agents, with the use of their own or the Company's Capital.

The Company will afford equal facilities to Landowners for the execution of works of improvement either by their own Agents or by means of the Company's staff.
William Clifford, Sec.

SMITHFIELD CLUB, 1855.—FAT CATTLE SHOW.—The ANNUAL CHRISTMAS SHOW of FAT CATTLE, SHEEP, and PIGS, will take place on the 11th, 12th, 13th, and 14th of December, 1855, at the Carriage Bazaar, King Street, Portman Square, when nearly 800*l.* will be awarded in Prizes and Medals.

The printed forms of Certificates, properly filled up, must be returned to the Honorary Secretary on or before SATURDAY, November 10th. Prize Sheets and the necessary printed forms of Certificates are now ready, and can be obtained on application to B. T. Brandreth Gibbs, Honorary Secretary, Corner of Half-moon Street, Piccadilly, London.

All communications on the Club's business should bear the words "Smithfield Club" on the outside.

THE BIRMINGHAM CATTLE AND POULTRY SHOW, 1855.—The Seventh Great Annual Exhibition of CATTLE, SHEEP, PIGS, and DOMESTIC POULTRY, will be held in Bingley Hall, Birmingham, on TUESDAY, WEDNESDAY, THURSDAY, and FRIDAY, the 11th, 12th, 13th, and 14th of December next, when PRIZES will be awarded as follows:—

	£	s.	d.
CATTLE.—Including Two Extra Prizes of 20*l.* each and Two Gold Medals or other pieces of Plate of the value of 20*l.* each, for the best Ox or Steer, and the best Cow or Heifer	340	0	0
SHEEP.—First Prizes of 10*l.*, and Second Prizes of 5*l.*, for Leicesters, Long-Woolled Sheep not being Leicesters, South or other Down Sheep, Shropshire, and other Black or Grey-faced Short-Woolled Sheep—10 classes	150	0	0
PIGS.—Including Prizes for Pens of Breeding Pigs of a large and small breed	69	0	0
ROOTS.—Including a Silver Cup, value Five Guineas, for the best Collection of four different varieties	27	6	0
POULTRY.—Including Nine Silver Cups, of the value of Ten Guineas each, for the best Pen of Pencilled Hamburgh, Spangled Hamburgh, Polish, Spanish, Dorking, Cochin China, Game and Gold, or Silver Bantams; and for the best four Pens of Pigeons, to be exhibited, especially for this prize	451	10	0
	£1037	16	0

Exclusive of Silver Medals to the Breeders of Cattle, Sheep, and Pigs, and Prizes in the Extra Classes and for Cottagers' Poultry.

Mr. Ottley has also offered a Gold Medal, of the value of Ten Guineas, as an extra prize, for the best Pen of Polish Fowl of any colour, to be selected from the several classes for this variety.

Prize Lists, Certificates of Entry, and any further information may be obtained from the Secretary. The Entries close on Saturday, Nov. 10. John Morgan, Jun., Sec.
Offices—38, Bennett's Hill, Birmingham.

COLLEGE OF AGRICULTURE AND CHEMISTRY, AND OF PRACTICAL and GENERAL SCIENCE, 37 and Lower Kennington Lane, Kennington, near London.
Principal—J. C. Nesbit, F.G.S., F.C.S., &c.

The system of studies pursued in the College comprises every branch requisite to prepare youth for the pursuits of Agriculture, Engineering, Mining, Manufactures, and the Arts; for the Naval and Military Services, and for the Universities.

Analyses and Assays of every description are promptly and accurately executed at the College. The terms and other particulars may be had on application to the Principal.

CAUTION.

PARKES' STEEL DIGGING FORKS AND DRAINING TOOLS.

Whereas very inferior descriptions of Steel Digging Forks are now manufactured and sold, and I have been informed that purchasers of the same have believed them to be the same as those manufactured by me, and to which the Royal Agricultural Society and numerous Agricultural Societies' prizes have been awarded, I hereby respectfully inform the public that every Fork manufactured by me is stamped with my trade mark "J. P.," and that Messrs. Burgess & Key, of No. 103, Newgate Street, London, are my sole Wholesale Agents, and I have authorised them to replace to the purchaser every Fork of my manufacture found defective; they will also on application send Wholesale and Retail Price Lists, &c., post free. Francis Parkes & Co.

FIRST PRIZE REAPING MACHINE.
NOTICE.

MESSRS. BURGESS AND KEY beg respectfully to inform the public, and particularly the noblemen and gentlemen whose orders they were obliged to decline for this season on account of the manufacture not being fully arranged, that the Royal Agricultural Society's First Prize of 30*l.* was awarded to them for M'Cormick's Reaper, with their patent screw platform, at the trial at Leigh Court, near Bristol, upon the 29th of August last. Amongst the competing machines were Bell's, by Crosskill; Forbush's, exhibited by Mr. Palmer; and Hussey's, with tilting platform, by Wm. Dray & Co. The reports of farmers who have worked the machines during this present harvest, show that the average quantity of Wheat, Barley, and Oats which they cut was from 1¼ to 1½ acre per hour. Two horses work the machine with ease, and the only attendant required is a man or a boy to drive. Further particulars and prices sent free on application.—Burgess & Key, 103, Newgate Street; and 52, Little Britain, London.

The Agricultural Gazette.

SATURDAY, OCTOBER 20, 1855.

Messrs. Hardy & Son having sown 2 acres and 3 roods of land in 12 different ways and reaped the produce, have published their experience, and some of their plots (Nos. 9 and 10, one square yard each!) being specially "reserved for public criticism," we are the more willing to give our opinion of their experiment. It is shortly this—that it is simply absurd to reason agriculturally upon the produce of square yards. You may draw physiological conclusions from single plants with confidence—the examination of a single seed and observation of its germination, growth, and produce will teach the botanist—it will even teach the farmer *qualitatively* many a useful lesson, but *quantitatively* none. He may learn generally the nature of the circumstances favourable to the vigour of the plant in each stage of its growth; but he cannot learn from an individual plant in a border the produce he may expect from 50,000 of them in a field. This would be as likely to mislead as the attempt to calculate an expenditure per annum from the outlay during any selected hour of the 8766 that make the year.

It appears that off a single square yard of ground Messrs. Hardy have obtained one quart of Wheat. Now, there are 4840 square yards in an acre, and there are 32 quarts in a bushel, and this yield is accordingly announced as an acreable produce of 18 quarters. It is no such thing—it is a yield of 1 quart from a certain square yard of land, and that is all that can be said of it. That yard may have been an ordinary arable soil, but its produce depends not only on what it was but also on where it was. Placed in an open border with air and sunshine freely playing on it, and soil around unoccupied, in which its roots might spread, a plot of Wheat would yield very differently from what it would if surrounded by a growing crop and by the land engaged in growing it.

What Messrs. Hardy's plot of land may be, or under what circumstances its produce may have been obtained we do not know, but we must not give these gentlemen credit for superhuman power which alone can accurately read in any case of growth all the causes which have influenced it; and, failing that ability, no one can expect to reproduce in his experience the 50,000 similar plots which would yield 180 quarters of Wheat from off the area of a 10-acre field. The fact of course is, as every person knows—that just as he cannot bring to bear on every square yard of an acre the fertilising influences which, selecting any single yard, he may apply, so he cannot reap from that collection of square yards which makes a field the produce which by horticulture and the "rule of three" Messrs. Hardy would teach us that he can.

What the force of just those influences, which the farmer cannot wield (although the gardener may), must be, may be gathered from the result of No. 10 on Mr. Hardy's list. Here was a square yard replanted on its harvest day with the seed which had been "that minute" gathered from it. What sort of result would the agriculturist obtain from a practice of this kind! And yet the produce of the garden plot thus treated is stated to be "good." It was so owing to that air, and sun, and *cultivation*, which an isolated yard of ground may receive, but which on many an arable farm it is impossible with profit to give the million of them that many an arable farmer grows.

No doubt the inference is perfectly sound that air, and sun, and cultivation are very fertilising things; but how much of each can be profitably secured for every plant upon a farm, and how much the average produce of the farm can be thus increased, are questions that Messrs. Hardy's experiments do not enable them to answer. Let them keep to the actual produce of their plots in their statements, and if those plots are acres then, and then alone inform us of an acreable produce. It has been abundantly proved how largely individual plants improve by the individual attention of the cultivator, and by larger room for growth than in field culture they generally receive—what we now want is the experience of *the farmer* as to the influence of such costly things upon the balance-sheet. That a greater amount of both carefulness and room than is common yet, is profitable, is plain from the gradually diminishing quantity of seed that farmers sow per acre. We believe that 4 or 5 pecks of Wheat per acre are in many cases a sufficient seeding, and that the 8 and 10 which still are common may in every case be considerably reduced. The present is the season when such considerations as Messrs. Hardy have attempted to enforce should receive attention, and this we bespeak for them notwithstanding the extravagance of which those are guilty who speak of 18 quarters per acre as a result proved possible by garden cultivation.

The mischievous effects of the plough (which we are at present compelled to make shift with) upon clay lands, have been long ago graphically described by "C. W. H.," and admitted, we suppose, by all candid agricultural thinkers. With what implement, then, are we to arm the steam-engine, when asking it to cultivate our obstinate but fertile fields? Looking at the wonderful success of spade husbandry in raising garden produce from strong land, bearing in mind the actual results of the Lois-Weedon deep digging, and not forgetting the extensive use of spade trenching and forking by our celebrated Flemish neighbours, we cannot hesitate to say, let us closely imitate *the spade* by our new tillage machinery. From a *practical* point of view, judging by the best modes of tillage now known, we have inferred (in previous papers) that the clay lands require a digging machine able to invert and cultivate a staple at least 1 foot deep, leaving the surface in rough clods; or, when preparing a seed-bed, raking, harrowing, or crushing the upturned earth for a few inches in depth. In other words, a steam cultivator should *trench almost as well as a spade*, and have power to *comminute the surface ad libitum*.

From a *theoretical* point of view, however, the subject presents a somewhat different aspect. Setting aside all considerations of cleansing from root-weeds and burying surface vegetation, chemistry says, "expose your land as much and as deeply as possible to the action of air and rain-water, in order to prepare for plants the dormant stores of nutriment abounding within it." It is the business of agriculture to discover the best method of doing this.

Temperature, electrical agency, absorption, evaporation, &c., are influences which the farmer may control and regulate in the soil by means of cultivation; and these, with the chemical operations just mentioned, may be said to be combined in one general process of Aeration.

Now, as rain-water and air in a certain degree naturally find their way down through the soil, the most obvious means of facilitating their admission is to open the ground with cavities and crevices, and provide against any stagnation that might check the inflow from above. Drainage, subsoiling, and all stirring tillage operate in this way. But atmospheric action in the cells and recesses of the soil cannot be so free, powerful, and incessantly renewed as upon the open, uncovered surface: therefore it is clearly expedient to raise the hidden portions of the soil from time to time, and expose them in clods or smaller particles to the wind, rain, and other atmospheric influences. Of course such an inversion of the staple accomplishes other beneficial effects,—as, for instance, relieving and replacing the upper portion of soil which has sustained most vegetation in crop and weeds; and again, bringing up many valuable substances that have been washed downward by the descending currents of rain-water.

Inversion (thus shown to be necessary) we can perform only in preparatory tillage: *opening, stir-*

ring, or subdividing can be practised both in preparing land for a crop, and also while the crop is growing—as by the hand or horse-hoe.

The next inquiry is, *to what extent shall we pulverise* in order to secure the greatest atmospheric action? A soil to be completely aerated *must* be finely comminuted. But how; mechanically or by natural agencies? Nature will break the largest clods for us if we only give her time: "the first shower of rain bursts the sun-and-air-baked clod, and it falls exposed in the natural cleavage." If, unwilling to wait this time, we cut and crush up our rough clay fallow by machinery, the same rain which would have left its coarse clods finely powdered, will now cause it to agglutinate and close up. We cannot successfully violate the scientific method of "assisting nature," unless we are prepared to repudiate her assistance altogether: and this we cannot do in cultivation until we substitute artificial heat and light for sunshine, irrigate in lieu of intercepted rain-fall, and breathe air, carbonic acid, and ammonia, through the soil by injecting steam-pumps. A valued correspondent, who has well studied and expounded the properties of a clay soil, thus elucidates the mystery—"You are aware of the practice of sportsmen of late years, having their gunpowder in *large grains*. Why? because the freer admission of air among large granules causes the whole to ignite in the barrel, and also prevents consolidation by the ramrod. For 'ramrod' read 'cohesive attraction and gravitation,' and the philosophy of clods is made manifest."

A machine for *rasping or grating the soil into powder is not specially adapted, therefore, for aerating such an obstinate cohesive material as clay;* though it might be expeditious in making a shallow seed-bed upon ground which has previously undergone the slow process of atmospheric fertilisation, just as we find the "clod-crusher" useful at certain times. And a further reason may be given. The above writer says, "It is the property of atmospheric air to lose its active qualities, when it is, so to speak, cut up into detail. The natural retention of animal warmth by *fur* coverings is a familiar, and perhaps the best illustration of this." By subdividing a clay soil we enormously increase the extent of superficies upon which the air might operate; but in proportion as we do so, we reduce the ability of the atmosphere to act upon it. Instead of locking up the air in no matter how many myriads of minute cells, we ought to be continually *changing it* for fresh supplies; currents of air charged, as it were, with active ingredients, should play through the soil, constantly replacing that which has been sucked of its virtues. If we could *incessantly* stir and commingle a finely granulated staple, as deeply as the aeration is needed, perhaps the case would be different. A starch-maker, wishing to bring every atom of his raw material into contact with a chemical solution, grinds it to a powder, and then agitates and churns it in the solution for hours. In subjecting fine earth to the action of a subtle fluid like air, we can imitate this process—but only when the work is shallow, and therefore readily manipulated—as, in horse-hoeing. To rouse and beat-up a foot depth of soil sufficiently often would require a most extravagant expenditure of labour. The only remaining course is, to cut our clay ground the full depth we choose, to go into *pieces of moderate size*, which will leave interspaces for the free circulation of air, and can be easily crumbled by the action of the weather. As the self-acting disintegration proceeds, the entire mass will become gradually aerated—mechanical assistance being given in the form of frequent rough stirrings.

Fine pulveration of the surface would bar the descent of air currents to the recesses of the subsoil; and however thoroughly it might fertilise the shallow surface stratum (which alone it is in our power to till so constantly), it must only be practised when the underlying portion of the staple has already received sufficient "fallowing" or aeration—in other words, we should keep the land rough until the crop is to be sown; we may then pulverise for a seed-bed, and afterwards hoe whilst the crop is growing.

Theory, then, leads us to the same practical conclusion as does observation of our actual methods of tillage: that is, we arrive at the same kind of implement described as the *desideratum* in the beginning of this article. *I. A. C.*

OILCAKE FROM COTTON SEED.

Thinking that it may possibly be of some use to the agricultural public, I beg to inclose you the analysis of a piece of oilcake made from Cotton seed, which has (in a small quantity only) been manufactured and imported into this country by a gentleman of the name of Barber, residing at Poulton Hall, in Cheshire. I received the piece of cake with the information that he had imported only sufficient to try its feeding effects on about 20 head of cattle, which by its means were rapidly and economically brought to a fit state for the butcher. I thought that I could do no better than immediately to forward it to Professor Way for analysis, at the same time requesting his opinion as to its value in comparison with oilcake. You will perceive that the result is highly in favour of the new cake; and I hope that it may be the means of reducing in the market the now, to the farmer, unprofitable price of Linseed-cake, which it would be very likely to do, as many thousands of tons might be produced in the United States of America alone; and I am given to understand that Mr. Barber believes that it can be supplied to the farmer at (at least) from 2*l.* to 3*l.* less cost than Linseed-cake.

I would beg to suggest that out of compliment to Mr. Barber, as the introducer of so valuable an article of food for cattle, that it should be called "Barber's Cake," which would in the market be a convenient distinction between it and that hitherto commonly known under the name of "oilcake." Mr. Barber has already been spirited enough to establish machinery in America for the manufacture of it, and I believe that his great desire is to render its introduction of as much benefit as possible to his country. The paper alluded to by Professor Way is to be found in the Journal of the Royal Agricultural Society, Vol. X., part 2. *T. G. A. Parkyns, Ruddington Manor, near Nottingham, October* 16. The following is Professor Way's letter and analysis:—

"15, Welbeck Street, Oct. 12, 1855.

"Sir Thomas,—I have made a careful analysis of the sample of cake which reached me on the 3d inst. In order that you may have the means of comparing it with other kinds of cake, I have enclosed a paper published by myself some few years ago, of which I beg your acceptance. With a full proportion of albuminous constituents, the sample of cake now analysed contains nearly twice as much oil as foreign or English Linseed and Rape cake, and I think it should therefore be superior to them in feeding and fattening properties. Experience, however, alone can decide this point. The proportion of water (moisture) is also small, which is in favour of the cake's keeping without injury. Unless, therefore, it should be distasteful to animals, I should form a high opinion of its value.—I am, Sir Thomas, your obedient servant, "J. Thomas Way.

"Sir Thomas Parkyns, Bart."

Sample of Oilcake received from Sir Thomas Parkyns, October 3, 1855.

Moisture	6.58
Oil and fatty matters	19.40
Albuminous matters (containing 4.46 nitrogen)	28.31
Woody fibre	10.64
Starch, gum, sugar, &c.	26.98
Mineral matter or "ash"	8.09
	100.00

The mineral matter consists of—

Lime	0.34
Magnesia	0.84
Phosphoric acid	2.62
Silica	2.27
Potash and soda	2.02
	8.09

(Signed) J. Thomas Way, Oct. 12, 1855.

IRISH FARMING.

As oases in deserts there are certainly bright spots in Irish farming, but unfortunately they are all but limited to the few wealthy and resident proprietors, and perhaps not more numerous rich and intelligent tillers of the land, for as examples these are very ineffectual, it is their wealth that does it; but, taking it as a whole, the tillage economy of the country is execrable, the great good that a great evil was to effectuate is still *in nubibus*. A cart to stop a gap is a common thing enough in Ireland, but this is still capable of improvement—"I'll make up no gaps—I'll hang no gates—I won't even put a bush in them; why should I? I keep a wretched child out in all weather to herd my wretched cattle, and you may do the same, or be sued for trespass if yours walk through my gaps, which like the old fellow I leave as temptations in their way." Why, in a small Grass field, containing less than an acre I find five gaps level with the base of the fence, on the road side; on another farm the whole road fence is one continued gap. Why, I have seen a farmer, a knowing man as he thinks himself, certainly a cunning one, holding about 100 acres of land, herding a single hog on a headland, and his son, 18 or 20 years of age, herding 6 or 8 swine on the roadside. He has one gate, value 2*s.* 6*d.*, on his whole farm; he has something over a quarter of an acre of Turnips and no other green crop, save the everlasting Potato and a quarter of an acre of Cabbage plants to plant out on the edges of his Potato ridges and for the market. He does not think Vetches a paying crop; would not the same area in Oats be worth more? Cannot comprehend making manure out of them, or that intervening between two white crops would make up any shortcoming at market. Winter Vetches, never heard of them. Sells much of his hay, feeds his milch cows with straw, and has through the winter perhaps a gallon or two of milk a day from his whole dairy stock of seven or eight cows.

Or let us take one of a better class, holding perhaps 200 acres of land; he is, however, more of a grazier and dairyman, therefore his ground is not deteriorated by repeated croppings. He perhaps grows 10 or a dozen acres of Turnips, most of them, however, for the market, and for the months of November, December, January, and February feeds all his stock exclusively with straw, March and April with hay, turns out to Grass on 1st of May, his milch cows some score or so dry through the winter; "cattle fed solely on straw and hay in the winter thrive better on the summer Grass than those which have had Turnips or other green feeding." No Clover, no Italian Rye-grass, no Vetches. Of course he grows a reasonable share of Potatoes, but he applies to them in ridges, and to his Turnips in drills, indiscriminately reduced or unreduced yard-manure in large quantities, uses no artificials, rather despises them; yet with this manure, without oilcake or even green feeding to enrich the dung-heap, solely made up of straw thrown in abundance under them and passed through his cattle, he obtains very heavy and fine crops. He is held a good farmer, and is a money-making man, for he is a shrewd one.

The grazier I do not meddle with; he is a fat, comfortable, well fed, and most knowing fellow. Yorkshire could not beat him. The smaller farmers—that is, those holding under 100 acres—as they fall lower in the scale of means also generally sink lower in their economy until you come to the 5th, 6th, or 8th succession of Oat crop, the last crop being superseded by one of weeds, which are left for three or four years for the benefit of the miserable cows and ponies that the possessor may happen to have. Of course subsoiling and draining are in every case out of the question, although no land in the world wants it more or would better repay the cost. The tenant, though with a lease almost interminable, will not do it, and then the landlord, even when so disposed, has little temptation to it, for the tenant would not give him one penny more rent for it on account of his outlay.

Still there is one redeeming point in the Irish farmer—he is a man of taste; not more does nature abhor a vacuum than he does a straight line, except in making a short cut to save time, which he loses tenfold the next moment with the first idle fellow he meets; he has the most acute sense of the beauty of curves, and nothing will persuade him to draw a straight furrow; he ploughs and digs his Potato ridges, which guide all future tillage, in all manner of twists without any other discoverable reason than this love of the beautiful, for even does the side of the field at which he commences happen from some accident to be in a straight line and his first ridge or two be directed by it, he cannot bring himself to stick to this ugly way, but gradually serpentines into the more beautiful if not most grotesque waves. Occasionally too will be seen a small field sown with Clover and hay seed, and even here his taste is shown, for they lie in alternate stripes, waved of course, which gives a very pretty variety to what would else carry too much sameness. *J. M. Goodiff, Granard, Oct.* 3.

ON BURNING CLAY AS A MANURE.

I am glad to see by the leading article in the *Agricultural Gazette* of Sept. 15, that you are endeavouring to call attention to the subject of burning clay as a manure. There is a certain description of land which has had amongst farmers for time immemorial a bad name. I allude to the poor stiff clays which we find dotted about the country, and for which nobody has a good word to spare, except, perhaps, an occasional interjection of pity for the poor unfortunate occupier. The value of this description of land has not advanced at all in proportion to that of the lighter soils in the kingdom, and is proverbially occupied by the poorest class of tenants. I have known many instances where such land has been gradually let for a lower and lower rent till it has become a matter of difficulty to find an occupier. I have myself had such a case to deal with, and if this meets the eye of the owner of any such land, let him take comfort from what I am about to write, and adopt the same means, and I do not fear for the result.

The farm I allude to was given up by a tenant who had succeeded his father on an estate where the greatest security to a good tenant has always prevailed, and where the tenancies remain in the same family for generations; the rent of this farm had been lowered repeatedly to suit the decreasing means of the occupier, and stood at last at 10*s.* per acre! This may sound absurd when I say the farm is in sight of, and not more than 8 miles distant from a large manufacturing town of 100,000 inhabitants; and yet the soil was reduced, and so proverbial for sterility had this unfortunate farm become that no one would take it at that rent, and the owner had it thrown on his hands when agricultural prospects looked the darkest, and the enviable task of farming it and bringing it round devolved on me. And many a joke did my brother farmers have at my expense, the whole subject seeming to afford them intense amusement, and the joke against me throughout the miserable wet seasons of 1852 and 1853, during which most trying times I was engaged in burning clay extensively; but so wet was the land that I could not apply it without making each field a complete mortar heap, and rendering it unfit to sow the seed upon. The first two years the miserable crops yielded about as follows:—

2 quarters of Wheat per acre,
1 quarter of Barley per acre,
1 quarter of Beans per acre,
Less than 3 quarters of Oats per acre.

The straw was like needles, and barely sufficed to maintain the 10 horses required to work the farm, so that I could not keep any stock in the winter, having nothing to feed them upon, and consequently could not make any manure.

In 1853, directly after harvest, I laid on my burnt clay, and by great exertion succeeded in applying about 10,000 cubic yards upon rather more than 100 acres of land. The result was extraordinary. I have no hesitation in estimating the straw at four times the quantity formerly produced, and I increased the insurance on the corn from 300*l.* to 700*l.* I succeeded in producing 10 acres of excellent Turnips, the whole of which were drawn off and eaten in the fold-yard, in which I kept 24 head of horned cattle, all of which had Turnips and

straw *ad libitum* up to the 8th June last. I need hardly say they made me a famous manure heap.

Finding the burnt clay so effective I have now applied altogether about 17,500 cubic yards with the best results. I have 15 acres of the finest Turnips in the neighbourhood, the insurance on the corn has been raised from 700*l.* to 1200*l.*, and I can show a very good rick-yard, and the quality of the grain will be excellent. Moreover, I shall be able to keep more stock, and make more manure than last year, and I have little fear but that the farm may be made self-supporting. The farm has been thoroughly drained, but to the burnt clay I attribute the rapid improvement that has taken place.

It will be hardly necessary to add that the joke formerly so very funny and amusing has entirely subsided, and that those who were the loudest in their laughter, and the most witty in their remarks, have now the least to say upon the subject, and console themselves by saying that money will do anything. The cost has been as follows :—

1 cubic yard of clay, measured after burning ...	6*d.*
Filling, spreading, and applying	2
Fuel, &c.	1
Cost of 1 cubic yard applied	9*d.*

100 cubic yards per acre, or even 80, are a good dressing, and I have no hesitation in saying that 4*l.* per acre (which is about the amount mine has cost, including everything but the horse labour) will produce an improvement on strong clay land, superior to anything else that can be had for the money, and will certainly pay in the first Wheat crop at present prices ; and as to the durability of the improvement I can distinctly see it after three crops, which is as far back as I have the opportunity of noticing. I inclose my name and address, and I shall be happy to afford any further information, or to name the locality to any one desirous of seeing the result of the extensive application of burnt clay. *B.*

QUALITIES OF WOOL IN GREAT BRITAIN.

[The following is a *resumé* of the information on the characteristics of the different breeds of sheep in this country, given by Professor Wilson in the "Journal of the English Agricultural Society."]

Lincoln.—This may be considered the standard of the coarse deep-grown wools for combing purposes, and the wool possesses a bright silky appearance of staple, which renders it peculiarly adapted for "lustre" goods, in imitation of alpacas and mohair fabrics, and has thus enhanced its value of late years. The present value of Lincolnshire wethers is about 12½*d.* per lb. ; of hogs, 13*d.* per lb.

Leicester.—This old and much-valued breed for combing purposes is rather finer in hair than Lincolnshire wool, but does not possess generally so soft and silky a staple, and hence it is not at present so valuable where those qualities are requisite. The present value of Leicester wethers is 12*d.* per lb. ; hogs, 12½*d.* to 13*d.* per lb.

Cotswold.—A deep-grown breed ; the wool similar in quality to Leicester, of a deep and rather harsh character, not suitable for lustre goods. The present value of wethers is 12*d.* per lb. ; hogs, 12½*d.* to 13*d.* per lb.

Romney Marsh.—Soft rich wool, finer in quality than the Leicester. It has been much exported to France, and seems well adapted to the use of the French manufactures. In Kent the lambs are generally shorn, therefore there are very few hogs. The present value of the Kent fleeces is about 13*d.* per lb.

Devons—South Hams.—A deep stapled breed of wool, grown in the country from which it derives its name. It is the custom of the farmers in Devon not to wash the sheep before shearing them, and the wool being thus in the yolk or grease, is not so marketable as other kinds, which are washed ; it is, therefore, usually subjected to the process of combing before before being sent to market, and comes in the form of "tops." A double advantage is accomplished by this ; the wool is sent in marketable form, and the noils and short wool, separated in the process of sorting and combing, are sold to the Devonshire manufacturers, who use them. If the wool were washed and shorn in the same way as in other districts, it would be readily saleable. Price about 9*d.* per lb. in the grease.

Bamborough.—Of the Leicester character, from the coast district of North Northumberland. A rich good combing wool, of tolerably fine quality ; very much resembles the Leicester, though with more lustre. The present value of wethers is about 12½*d.* per lb. ; hogs, 13½*d.* per lb.

Bampton.—A breed peculiar to Somerset and Devon ; deep grown, good average combing wool, of similar kind to the Leicester breed. The present value of hogs is about 13*d.* per lb. ; wethers, 12½*d.* per lb.

South Down.—Small haired wool ; the tegs and longer wethers used for combing purposes, and the shorter for the manufacture of flannel and other light woollen goods. There is considerable difference in this wool, from the different localities, both as to quality and softness. The present value of ewes and wethers is 13*d.* to 13½*d.* per lb. ; tegs, 13½*d.* to 14*d.* per lb.

Hampshire Down.—A short wool, very similar to South Down in general character ; staple rather longer, and hardly so fine. The present value of ewes and wethers is 13*d.* per lb. ; tegs, 13½*d.* per lb.

Norfolk Down.—The Down wool grown in Norfolk is generally soft in its nature, but usually full of blue sand, which reduces its value. Some of the best and cleanest is very rich and beautiful wool. The present value of ewes and wethers is 12½*d.* per lb. of sandy, 13½*d.* per lb. of clean ; tegs, 13½*d.* to 14*d.* per lb.

Shropshire Downs.—Generally longer in the staple, and with more lustre than the other Down wools. The fleeces vary considerably, according to the original proportion of short-woolled or long-woolled blood crossed with the breed. The present value of wethers, &c., is 13*d.* to 13½*d.* per lb. ; tegs, 13½*d.* to 14*d.* per lb.

Dorset.—Rather longer in the staple and not quite so fine as the Downs, but for combing purposes quite as valuable ; clean, white, soft wool. In this country the lambs are generally shorn. The present value of Dorset fleeces, 13*d.* per lb. ; of lambs' wool, 16*d.* to 18*d.* per lb.

Ryeland.—An old breed, almost extinct, very fine and short ; formerly used for clothing purposes. The present value about 13½*d.* per lb.

Merino.—Some years ago there were many flocks of this breed kept in Hants and the adjoining counties : when fine wools were first used for combing purposes this wool realised very high prices, but after the introduction of Saxony and Australian wool for combing, these wools were to be bought much cheaper than the Merino, and it became little used. Merino wool generally came to market much heavier, and not so well washed, as Down wool. It was also much more wasty than Saxony or Australian. The present value, say wethers, 14*d.* per lb. ; of hogs, 15*d.* per lb. ; but almost unknown in the market.

Dartmoor.—From the Dartmoor Hills in Devon. Deep-grown combing wool, but coarser and not so well bred as the South-down. Generally shorn in the grease. Value in the grease about 9*d.* per lb.

Exmoor.—A long-stapled wool of moderate quality ; that produced by the polled sheep is usually heavier in the fleece, of a finer description. The present value of wethers about 12*d.* per lb. ; of hogs, 12½*d.*

Radnor and Welsh Mountain.—A moderate combing wool, somewhat coarse in quality and kempy. The present value of wethers, 12½*d.* per lb. ; of tegs, 13½*d.* per lb.

Cheviots.—This is a small haired wool of medium length, suitable for worsted and woollen purposes. It is a soft, rich wool, and is liked by the manufacturers. In those districts where the sheep are smeared the value of the wool is considerably reduced. The present value of ewes and wethers, 12½*d.* to 13*d.* per lb. ; of hogs, 13½*d.* to 14*d.* per lb.

Black-faced Highland.—The kind of sheep kept upon the mountains and hills in the Highlands of Scotland ; very coarse, and generally depreciated in value by the composition with which the sheep are heavily smeared ; used for carpets, rugs, and low woollen purposes. The present value, 8*d.* to 9*d.* per lb.

Herdwick.—Peculiar to the mountainous districts of the counties of Westmoreland and Cumberland. The wool is used for making low woollen goods, rugs, &c. Present value about 8*d.* to 9*d.* per lb.

Shetland Wool.—Small wool grown in the Shetland Isles, and used chiefly by the natives for clothing, and occasionally for hosiery purposes. The present value about 8*d.* to 9*d.* per lb.

CROSSES OF BREEDS.

Leicester and South-downs.—Generally grown in the Leicester district, and formerly much more valuable than Leicester wool. Since the introduction of cotton warps, reduced in comparative value. The present value of ewes and wethers, 12½*d.* per lb. ; of hogs, 13*d.* to 13½*d.* per lb.

Leicester and Shropshire-downs.—A breed of the Shropshire district ; longer and more valuable than the Down ; good combing wool. The present value of hogs about 14*d.* per lb. ; of wethers, 13*d.* per lb.

Leicester and Highland.—From the Scotch district ; suitable for low combing purposes, and more valuable than the pure Highland wool. The present value of ewes and wethers, 9*d.* to 10*d.* per lb. ; of hogs, 10*d.* to 11*d.* per lb.

Leicester and Bampton.—A cross of two breeds, the wool of which is of very similar kind. The present value of hogs, 12½*d.* to 13*d.* per lb. ; of wethers, 12*d.* to 12½*d.* per lb.

Leicester and Norfolk-down.—A very excellent wool, soft and rich ; used for worsted purposes. The present value of ewes and wethers, 12½*d.* per lb. ; of hogs, 13½*d.* per lb.

Cotswold and South-down.—A breed of the Cotswold district, suitable for worsted purposes, more valuable than the pure Cotswold breed. The present value of ewes and wethers, 12½*d.* per lb. ; of hogs, 13½*d.* per lb.

Cotswold and Hampshire-down.—Same as Cotswold and South-down.

Cotswold and Shropshire-down.—A breed of the Shropshire district by which greater length is obtained than from the Shropshire-downs alone. Used for worsted purposes. The present value of ewes and wethers, 12*d.* to 12½*d.* per lb. ; of hogs, 13½*d.* per lb.

Lincoln and South-down.—A breed in Lincolnshire finer than the Lincoln wool and more valuable ; used for worsted purposes. The present value of ewes and wethers, 12½*d.* to 13*d.* per lb. ; of hogs, 13½*d.* to 14*d.* per lb.

Lincoln and Exmoor.—The produce of two deep-grown breeds ; suitable for combing. The present value of hogs, about 12½*d.* per lb. ; of wethers, 12*d.* per lb.

Cheviot and South-down.—A breed in Scotland which produces a finer wool than the Cheviots ; suitable for finer worsted and woollen fabrics. The present value of ewes and wethers, 12½*d.* to 13½*d.* per lb. ; of hogs, about 14*d.* per lb.

Highland and South-down.—A good combing wool, longer in the staple than pure Down ; suitable for clothing purposes. The present value 13*d.* to 14*d.* per lb.

Dorset and South-down.—A breed of Dorsets ; are of equal length with the Dorset and much finer ; a soft rich wool, suitable for finer worsted purposes. The lambs are shorn in this district. The present value of Down and Dorset fleeces, 13*d.* to 13½*d.* per lb. ; of lambs, about 18*d.* to 20*d.* per lb.

Merino and Romney Marsh.—The fleece representing this cross-breed is a very beautiful one ; an excellent combing fleece ; fine, soft, clean, rich wool. When warps were made of worsted would have realised a very high value. The present value of hogs about 15*d.* per lb. ; of wethers, 14*d.* to 14½*d.* per lb.

Home Correspondence.

Warmth Conferred by Drainage.—I once ventured to assert that I did not believe there was much difference in the temperature of drained and undrained soil. I was met at once with great names, and the authority of Papers in the Royal Agricultural Journal ; I contented myself with saying that I believed it could not be proved either by theory or practice, and that any difference was rather due to the presence of water in the soil than to evaporation, as generally supposed. An examination of the tables published in your paper of the 1st of October shows that in the hottest months, June, July, and August, when there is most evaporation, the temperature is highest in the undrained soils. When a soil is filled with water as in undrained clays, the surface water is no doubt evaporated ; after the water table, or water level, has sunk say 4 inches in the soil, the evaporation will not extend to that depth. The surface will give off its water, and this will be replaced by the action of capillary attraction, so that the water table or level is reduced not by the direct action of evaporation, but by capillary attraction, rendered active by evaporation from the surface, therefore evaporation cannot affect the temperature below 4 inches, if so much. It must also be remembered that clays, after all free water is abstracted by draining, will hold in suspension one-fourth of their weight, and one-third of their bulk ; if this was not so vegetation would soon be at a stand-still. *James C. Clutterbuck.*

Perennial Weeds.—In localities where perennial weeds exist to an alarming extent, whose vigour is increased rather than diminished by passing the plough over them, merely taking off their heads, it is astonishing that farmers do not use the long steel fork to assist in cleansing at least a portion of their holding annually. On a farm of 200 acres of arable land it would not be practicable for a farmer of ordinary means to employ a sufficient number of men to go over the whole of the farm in this way ; but he might with great benefit to himself set apart every year a certain number of the worst acres to be stirred with the long steel fork. Those in ordinary use, made of iron, are valueless for such an operation. It is false economy to half till land in order to save expense. The outlay is great at first in thorough cultivation, but once carried out moderate attention and exertion will keep the land in a creditable and profitable state, very nearly doubling the produce. No man can afford to grow two crops —one of weeds and another of grain—if he pays a fair rent to his landlord ; as well might he hope to fatten two bacon pigs on food barely sufficient to provide a couple of sides for winter consumption. It is not necessary to enter deeply into the scientific part of agriculture to obtain remunerative produce from ordinary land ; common sense and observation will enable a man to avoid the rocks and shoals of theory, and bring into practice useful improvements. The principal feature in a well-managed farm is labour of all descriptions judiciously applied, and plenty of it ; the labourers must be liberally paid, and the horses in good condition. There is no economy in working animals only fit for the dogs, and screwing wages to the lowest point ; these will serve you better when treated like neighbours, and horses will perform twice the work if properly cared for. It is melancholy to look at the unfortunate quadrupeds dragging their wearied bodies along the road, and the waggon following very reluctantly. These poor beasts eat as much as strong animals, that is if they can obtain it, do one third of the work, and are in reality one of the "penny wise and pound foolish" bargains short-sighted people make. People complain of their crops, and yet expect Potatoes to grow on land hard and stiff in the subsoil, the surface having been moved about six inches, the space between the rows being overrun with Couch Grass, Cat's-Tail, &c. All land is improved by exposure to the air, and none more so than tenacious clays. Plant food obtained from the atmosphere is most valuable, which may be proved by forking between alternate rows of vegetables or Wheat ; the difference in growth will be perceptible in a few days, the experiment will repay the gardener or farmer, and speak more forcibly for itself than can be done on paper. Under a vigilant eye labour on the farm is never thrown away, though it may appear superfluous to the idle and ignorant ;—indirect brings in its wake direct gain. *Falcon.*

Small Farms.—The legislature have for a long while reduced the stamps upon leases, and it would be a blessing if the landed proprietors would but lease out to a poor man an acre or two of land at a cheap rate. See how many embarked in the land scheme of F. O'Connor, M.P., and how many are now paying enormously for a 40*s.* freehold. I look upon an acre of land upon lease making a man independent, and not dependent. There is one acre of land lost in every 25 acres by hedges and ditches, which only harbour insects and vermin : besides

which many have orchards which often yield fruit but once in two years; and woodland might be cleared and let out in small quantities upon lease. But I assure you, although the legislature have reduced the stamps upon leases—and where the rent is not 5*l.* the stamp is only 6*d.*—a poor man cannot get an acre or two upon lease. I believe many thousands now engaged in 40*s.* freeholds will before 10 or 12 years find the deeds in mortgage when wanted similar to F. O'Connor's case; and simply renting a plot of land upon lease would prevent many having anything to do with 40*s.* freeholds: besides which, I do consider, looking at these words in Genesis—"God made male and female, and gave them the earth for their inheritance," that while these words are manifest that it was ordained that man should have the earth, it is a shame that we should have a New Forest of 92,656 acres, and Dartmoor 200,000. Why should not land be leased in small quantities, for I say again one acre of land to a poor man is a great good to get? *Charles Paul*, 3, *Albert Grove, Peckham.* P.S. To give a man his acre or two (upon lease) you make him independent instead of dependent, and there is a wide difference between these words, and if you could but get land leased at an equitable rate it would be a blessing to mankind, and you would prevent many emigrating; a man may get an acre of land in America for 5*s.*, in this country he cannot for 70*l.* an acre.

Function of Salt in Agriculture.—In your article on this subject the power of salt to fix ammonia is in a great measure attributed to the presence of sulphate of lime in the salt, if I understood you rightly. It is, therefore, a matter of some importance to know the sort of salt which contains sulphate of lime, in the proportion most likely to retain the ammonia in guano for the longest period. A dealer in salt advised a farming relative of his never to be persuaded to buy refuse or agricultural salt because of its low price, for it was infallibly the dearest in the end, but to buy the pure salt although he paid much higher for it. I have used tons of salt, oil, or fishery salt—best salt—and this refuse salt; and although I do not feel competent to pronounce a judgment on their relative values, I have decided to purchase the best salt, if I buy any more for field purposes, rather than either of the others. It may be, however, that pure salt contains the least sulphate of lime. This would be an argument against using it with guano; but what salt to apply together with guano, instead of the pure salt, is a point which I do not think settled. Can any description, known to contain the requisite quantity of sulphate of lime, be got in any particular quarter? In the siftings of Stafford coal ashes, I read in an extract from the Royal Agricultural Society's Journal there is 2.44 per cent. of sulphate of lime. If 1 cwt. of guano were mixed with 10 cwt. of these siftings there would be about ¼ cwt. of sulphate of lime therein to operate upon the guano, if in such an admixture this be a thing possible. *Allerton, Oct.* 14.

Potato Haulm.—In a table of the comparative value of different kinds of fodder published by M. Antoine, at Nancy, 300 lbs. weight of Potato haulm is given as equal in value to 100 lbs. of the best upland meadow hay. Potato haulm stands very nearly as high as Carrots, and superior to a slight extent to Swedish Turnips and Mangold Wurzel, and very much superior to Cabbage and Beet leaves, and to common Turnips. The Norwegian farmers, who never perhaps thought of the theory which we might build on the relative value of Potato haulm to other fodder, are said to collect their Potato leaves, and to lay them on frames or fences, or any other places where they may be dried with facility; when dried they are kept for making cooked mashes for milch cows. A good handful of them is put in a vessel for each cow, and hot water poured over it; it is then left to stand covered until next day, when the leaves and juice are given to the cows. It is said that they yield much milk on this meal. I only met with this scrap about Norway the other day, and it may be new to some of your readers, who, like myself, have hitherto thought only of the value of the Potatoes themselves, and have left the haulm on the field. The analysis of Potato haulm would lead us to think it of some value, but I know not what constituent renders it so good as the Norwegians seem to find it to be for milch cows. One half of the ash is made up of lime, chloride of potassium, and potash. Leaving Potato haulm to be ventilated in your columns, if it be not too inconsiderable a matter for the operation, I wish success to the man who gives his milch cows the first Norwegian mess of it *à la mode. Allerton, Oct.* 13.

Fisken's Plough.—Anxious, on a former occasion, to expose "I. A. C." as little as possible, and the shortcomings of the invention in question because capable of great improvement, it appears we have failed in convincing him of his (we repeat) serious mistake. The facts of the case which he ought to have laid before your readers are briefly these. Mr. Fisken's rigger steam plough (not Mr. Fisken himself, as somewhat learnedly but unwittingly insisted upon) is a compound of two old failures, the one patented in 1812 (No. 3632) by the Messrs. W. Chapman, of Durham, and E. W. Chapman, of Wallsend, Northumberland; and the other in 1833 (No. 6351), by Mr. J. Saxton, of London; and instead of "lessening the strain," or "working with a less strain upon the (its?) anchors than any one else has ever worked with," as unfortunately repeated last week, it does the very reverse, the strain being greater by the additional strain upon them in working the driving rope and rigger (or driving ropes and riggers according to the combination) "plus" the increase of rigger traction friction not so easily estimated. It is with some reluctance we go back with him to his "bold announcement" and its startling proof—"one's little finger at the long end of a lever," but when he himself admits that "the driving rope is running 20 miles per hour when the plough carriage is going only two," we may be allowed to ask: how can this difference be obtained without an increase of strain upon the anchors? The fact is, he commits suicide when he acknowledges that "the strain upon the rope is thus only 1-11th of the whole draught of the implement," for, granting this to be correct, if the long end of the lever balances the short—the "little finger" a "ton weight," then "the anchorage at the far side of the field" has to sustain "a drag" equal to twice the draught of the implement, "plus" twice "one eleventh," "plus" rigger-friction, or something more than double what he rather dogmatically teaches. With regard to steam ploughs sailing in our fields—Lincoln Fens, for example—the idea is so very refreshing now that we have no telegraph news from Sebastopol, that we hope the readers of the *Agricultural Gazette* will allow us to enjoy it a little, as questions of this kind can always be safely left in the hands of experience. If the continuous "feed" of a straw-cutter acts retardingly against the knife, like a brake on the wheel of a railway carriage—how can it be otherwise with the continuous progression of Usher's rotary ploughs against the unploughed land? *W. B.*

Steam Engines.—Mr. Mechi has sent us the following memorandum, which should have been appended to his last week's paper on this subject:—I find that without the air-vessel the escape-valve rises more or less at every stroke, and there is some jarring: with the air-vessel there is scarcely ever a rising of the valve, all is easy and tranquil, whereas without either valve or air-vessel, there was everywhere resistance, jarring, and straining. It is easy to understand that the confined elastic air receives the shock of the pump rod, and during the return of the latter gently pushes forward the water to the boiler. We should, with such an arrangement, rarely hear of any difficulty in supplying steam boilers with water.

Farmers' Clubs.

Killucan.—*Stall Feeding.*—The following is a portion of a paper on this subject, read by Mr. Harkness, at a meeting of the Killucan Farmers' Club:—A friend, who settled in the west of Ireland in the winter of 1852, fed 30 cattle in the winter 1853-4, for six months, giving them the first four months three feeds of Turnip daily 50 lbs. each, and for two months two feeds of 50 lbs. each with grain and oil-cake, at the rate of 40*s.* per head.

The cattle were sold in the Dublin Smithfield market at an average of 27*l.* 10*s.*		£825 0 0
Deduct.		
The Ballinasloe price of cattle when laid in	£450	
Extra food, cake, &c., at 40*s.* a-head ...	60	
Attendance and interest of money	30	
		£540 0 0
		£285 0 0

Setting the dung and extra food passed as excrement against the straw, these 30 cattle thus paid all extra food, and 11*l.* each to pay for Turnips and profit. The rent of Turnip field at 19*s.* per statute acre, and the fair proportion of manure and tillage chargeable against the Turnip crop, amounting in all say to 5*l.*, would leave the handsome clear profit of 6*l.* a head for feeding each beast, or assuming 25 tons of crop per statute acre, and 2½ cattle kept for six months on such a quantity of Turnip, the crop would thus pay at the rate of 15*l.* per acre for feeding. In 1854-5 the same friend fed a larger lot of cattle, and gave various kinds and quantities of food. His cattle getting cut straw, cooked with 4 lbs. of oil-cake and 2 lbs. of Barley-meal with decreased Turnip, not exceeding 112 lbs., have altogether progressed more rapidly than the cattle fed by any other method, making in some cases at the rate of 3 stone per week for three months. The details of the last trial we will get and publish. We find another case reported in the Royal Agricultural Society's Journal, that of Mr. Milne, of Clobemon, Ferns.

The 25 cattle fed by him from January to May 1853, sold for	£335 17 0
Cost price, interest of money, and extra food ...	219 19 0
	£115 18 0

This sum is left to pay for the Turnip, or 4*l.* 12*s.* 6*d.* per beast, which at the rate of 2½ animals to a statute acre of Turnip would be 12*l.* odd per statute acre, the straw being paid by the unappropriated food going for the manure. The following instance of cattle feeding we have from a Northumberland friend, of tried experience, Mr. Stephenson, Fourstones, near Hexham, Northumberland. We sent him a copy of our queries, and the following communications he gave in reply:—"I may not be able to answer all your queries satisfactorily, but if the following short remarks be worthy your attention, you are welcome to them. Having a hill farm along with my home one, I am enabled to breed all the stock I feed, which places me in a different position to a man who has to face the market to buy his lean cattle. My general system of feeding fat cattle is from home grown produce—viz., three feeds of cut Swedes of 40 lbs., more or less, according to the size of the animal, and 4 lbs. of compound each per day, with an unlimited quantity of uncut straw. The compound is made from crushed Linseed, with Bean, Pea, or Barley meal, and is cooked in a pot made for that purpose. I put 20 head of cattle, short-horns and half-breds, to feed the first week in November 1854; the fair market value for which would be 13*l.* each. I have sold 11 of the number, after feeding them 11 weeks, at 18*l.* each; the remainder, I have no doubt, will do as well, as they are a fair average of the lot. I have now put a second lot to feeding; 16 half-breds, 1 year and 7 months old, which I expect will be fat by the month of June. I fed a lot of the same kind of animals last year, 4 of which I sold at 1 year and 10 months old in Newcastle market, on the 18th of April, at 15*l.* 3*s.* each. I am a decided advocate for early maturity in cattle feeding. Quick returns is what we ought to aim at. I presume that your subject is intended to prove that Mr. Mechi is wrong in his assertions that fat cattle do not pay for the food they consume. I have no hesitation in saying that the stall-feeding of cattle does pay. If we look at the crops of Swedes which Mr. Mechi is stated to grow, from 12 to 15 tons per acre (the results of high farming), we need hardly wonder at his failure in feeding fat stock. I can grow from 25 to 30 tons per acre with good farming. High farming is one thing, and good farming is another. I have no opinion of the former as a system for a man to adopt who has his living to make by farming, but I am a warm advocate for the latter. I will back the balance sheet of the good farmer against the balance sheet of the high farmer for any amount. I agree in one remark made by Mr. Mechi—that farming is notoriously a slow business; but it would be much slower if it was not for the benefits derived from the feeding of fat cattle and sheep. Further, Sir, in answer to your inquiries as to the cost per ton of my last year's Swedes, I think the following will be near the mark:—

Rent of land per acre	£2 0 0
20 square yards of home made manure, 3*s.*	3 0 0
Preparing land, ploughing, grubbing, harrowing, hoeing Turnips, &c.	2 10 0
	£7 10 0

"I estimate the crop at fully 25 tons per acre, which will give 6*s.* the cost price per ton. The compound, with the present prices of grain, will be 1*d.* per lb. If you compare this with the statement already sent you, you will find the cost per head per week as follows:—

60 stone of Turnips	£0 2 3
2 stone of compound	0 2 4
	£0 4 7

"I have used this compound for some years, and believe its feeding properties to be superior to either Linseed cake or meal given in a dry state. I never give hay to feeding cattle, believing that it is a kind of food for which they never pay. Neither have I made any charge for straw or attendance, which cannot amount to a great deal per head. I will be paid in the manure made." Mr. Stephenson's report is very much to the point. We have also before us a most distinct report upon stall-feeding from Mr. Campbell, the intelligent agricultural manager of Sir Charles Coote, Bart., of Ballyfinn. We had the satisfaction of examining a large farm of Sir Charles, which has been reclaimed within the last eight or nine years from a waste deer forest, under the judicious, economic, and efficient management of Mr. Campbell. In addition to his excellent drainage and general improvement of the ground, we were highly gratified with his machinery and conveniences for cutting Turnips, straw, Furze, crushing bones for manure, and all kinds of grain and Pulse to be cooked by steam or hot water in large vats. Mr. Campbell remarks:—"I may observe that on such a farm, inferiorly situated, or far from the manure market, I consider stall-feeding stock indispensable, and without which the necessary stamina could not be supplied profitably during a desired rotation of the crops." Again he says—"As to profit we do not complain, if we secure on an average 20*s.* per month per head in cash. We frequently do more, but we consider this sum but a small portion of the profits of stall-feeding, as proved in effect on our cereals during the rotation." *Journal of the Agricultural Improvement Society of Ireland.*

Winchcomb.—On Wednesday last this association held its annual meeting. The forenoon was spent in awarding and distributing the various prizes at the disposal of the association, and the members and others afterwards dined together in the evening. Mr. E. Holland, M.P., occupied the chair, and stated, in the course of the entertainment, that since the formation of the Society, 16 years ago, as many as 597 premiums had been distributed by it to deserving persons for skill and good conduct, and the amount subscribed in money to pay those premiums was no less than 1198*l.* The Earl of Ellenborough spoke in the course of the evening. He said: I think it very desirable that there should be one occasion in the course of a year in which gentlemen who possess property, and those who are their tenants and cultivate their property, and the labourers also, especially those distinguished by good conduct, should meet at the same board on terms of perfect equality. I rejoice to hear that the subscribers to this Society are not diminished in number, but I wish that we met here on these occasions in greater numbers; and I do hope that those gentlemen who are here to-day will on future occasions endeavour to induce their friends to accompany them, so that we may have a full and proper representation of the property, tenantry, and labour of the union. And, gentlemen, Mr. Holland has very justly observed on the character of this institution. It is idle to suppose that the small reward which it is possible for us to give to an individual can really be a remuneration to him for in some cases some 36 years of good conduct. The thing is impossible. At the same time, the higher prizes are not in themselves quite insignificant. They will pay a man's rent for a year, which, in a certain degree, is an object to any man in

any situation. But the object of this institution is to show honour to good conduct. It is not the pecuniary reward—it is the acknowledgment publicly given to a man that he, in his station of life, has conducted himself with thorough respectability, and deserves the respect and honour of those by whom he is surrounded. That is what we tell them. We give them a card which shows this, and any one who goes into their cottages can see that this is our opinion of them. Why, you hear of soldiers fighting formerly for 1*s.*, and now for 1*s.* 6*d.* a day. They are not fighting for that alone. It is not that which induces them to risk their lives for their country. It is the hope of honour—the reward they expect for distinguished conduct in the field under the fire of the enemy—that is their reward. They know that wherever they go in after life, wherever they go before men—and still more before women—it procures for them general respect. Why, the medal which they receive is not worth half-a-crown. Do they ever attach a money value to it? It is the honour of the thing that they regard, and it is that honour which leads them to distinguish themselves in the presence of the enemy, to obtain glory for themselves and their country, and the advancement of public interests. And, as far as we can in our humble way, as agriculturists, we endeavour to promote the same feeling among labourers, by giving them the highest mark we can bestow of our respect and consideration. For myself, it is the greatest pleasure to see these most respectable persons approach this table and receive that which we can bestow; and I know it is to the employers a subject of the greatest gratification to be enabled to produce them at this table, and show how well they have been served. I am delighted to see the union between master and servant which is exhibited when these men come forward to receive their prizes. I know the master takes as much pleasure in it as the person who receives the prize. It is true that these establishments do not, because they cannot, exist in a manufacturing districts. Is that to be stated against or as a reason why we should not persevere in what we have begun? Quite the contrary. If there is any merit in it, the merit is ours, in having distinguished ourselves above the manufacturing classes, who have not established these institutions. But in point of fact, the servants of the manufacturer are situated so differently—the numbers are so enormous that is impossible to distinguish individuals; and in such districts societies like this would be almost totally inapplicable.

Farm Memoranda.

Deutsch Kreutz, near Odenburg, in Hungary.—After I had seen Baron von Haynau, and settled our business at Vienna, I was introduced to Mr. Haswell, the intelligent and talented manager of the railway-engine and carriage manufactory at Vienna: he is a native of Glasgow, which may be proud of her son. These are the second largest works of the kind on the Continent, and are second to none in arrangement and discipline. Mr. Haswell kindly introduced me to Mr. Smallbones, of Deutsch Kreutz, near Odenburg, in Hungary, consulting agent to Prince Esterhazy, under whom he occupies an extensive farm, which is a model of what can be done by English ingenuity, industry, and perseverance. Mr. Smallbones is highly thought of in Hungary by both rich and poor. By invitation I went down from Vienna to visit his farm in Hungary, which gave me much gratification, convincing me that the views I had taken of the productive powers of the soil of that ill-cultivated country were sound and correct. Mr. Smallbones' farm is upwards of 1200 acres English, all in tillage; he has likewise extensive rights of pasturage upon the neighbouring plains. The country all around Odenburg is slightly hilly, with mountains in the distance. The soil is a naturally fertile light loam, but, through the wretched system of farming practised, its productive powers had been much reduced; however, the example and success of Mr. Smallbones must ultimately do great good. Mr. Smallbones grows about 450 acres of Wheat, 150 of Barley, 150 of Maize, which he cuts green for fattening bullocks and feeding his farming horses and oxen; 150 acres of Tares, which are partly eaten in the houses by the fattening cattle and teams, the rest is eaten on the land by sheep, which have a liberal allowance of corn or cake at the same time; this crop is immediately followed by a crop of Turnips. He has also 150 acres of Mangold Wurzel, and 150 of Clover, with about 50 acres of Lucerne. I believe his rotation runs thus:—Wheat after Clover, Tares followed by Turnips, Barley, Indian Corn sown thick for soiling cattle, working oxen, and horses, Wheat, Mangold Wurzel, Wheat, Clover. The soil, like the surrounding country, is naturally good, but when it came into his occupation was in a poverty-stricken state; he set to work, however, with the full determination of showing what could be done in the way of improvement. Mr. Smallbones came over to England and took out a stock of the machinery and implements best adapted for the country and his system of farming. He is now getting his farm into excellent condition; although he has only had it a few years, his crops on all those fields that have been fallowed with roots are excellent, notwithstanding the season has been an unusually dry one, which has greatly reduced the usual bulk of straw, but the ears (on the land in good condition) were beautifully filled with fully-developed grain. When I was there he was having his Clover mown for hay; it was the heaviest and longest crop of Clover it has ever been my lot to see; above a yard high, and as thick as it could grow; and to see above a score mowers hard at work on 140 acres of such a crop, was one of the finest agricultural sights that could be witnessed. Mr. Smallbones has arranged his farm in rotation as near 150 acres each as the form of the land will permit; but has adopted the clever plan of making four fields as nearly as possible 75 acres each close to the homestead, and four of the same size at the greatest distance, one of each being cropped together, while in the middle distance the fields are the full size of 150 acres; thus he makes the distance, for the manure and other haulage to be done, the same one year as another, which is of great importance. The house is a splendid edifice, and the farm-buildings are of the best description and conveniently built. He had upwards of 100 head of large Hungarian cattle up feeding upon Tares; they were to be finished upon Indian Corn or Maize cut green, which is very fattening food. He had also 30 working oxen, 30 horses, and a large flock of sheep, which are folded on the same land 48 hours, eating mown tares and cake or corn mixed with a little chaff. Directly the sheep are off, the land is ploughed, pulverised, manured, and sown with Turnips; thus the field is got over as fast as the Tares are consumed. Part of the crop was up, the drills showing well, and proving by their straightness that the drill had been guided by a good workman; indeed, I saw Garrett's drill and horse-hoe, both, managed by Hungarian ploughmen as well as I have ever seen them in England. They were using the horse-hoe among the Mangold Wurzel the second time before thinning, which operation was also being performed in a most satisfactory way. It was gratifying to see the efficiency and expedition exercised by these poor ill used people when properly treated. Mr. Smallbones' farming is first rate; he drills his roots 16 inches apart and his grain 10 inches, and horse-hoes the whole. Well ordered economy is the rule of his establishment. He has several German, Austrian, and Hungarian gentlemen's sons learning the art of agriculture with him. I may state that he finds that the proper way of making oxen work is by pushing their forehead against a padded board, to the ends of which the traces are attached, as is the universal system throughout nearly all the continental nations. The oxen so worked are in no way injured for the butcher; they can also travel faster, chewing their cud at the same time, and can work longer hours without being overtired. He also finds that the plough in general use is much better than ours for moving and pulverising the soil; and that the rude waggons of the country are as economical as our more powerful and highly finished ones made in England, from their only weighing half the weight of ours. Weight is of paramount importance where the roads are generally mere tracks across the country; also, where produce has to be drawn a great distance to market, the proportion of power consumed in drawing the carriage to and fro is of vast importance, therefore this people adopt as a rule, in which he agrees with them, and so do I, that the carriage should never exceed one-fifth the gross weight of the load. These are, I believe, the only implements in which the continental nations excel us. After I left Mr. Smallbones I observed that the farming was much better near his farm, and that it gradually declined as we got further from him; there was, however, occasionally to be seen amongst the large owners one who was taking example by him, and had imported some of our best implements, such as Hornsby's drills, Garrett's horse-hoes, and Crosskill's clod-crushers, and was also draining his land and enclosing it in proper fields for rotation husbandry. This I have little doubt will soon become the rule in place of the exception as at present; for when we see a people taking up the example thus shown them, and unprejudicedly adopting it as far as their means will permit, it argues well for their advancement, especially when that example is such as will lead them to wealth and prosperity. Mr. Smallbones is now beginning to breed Hungarian cattle, with the view of improving them to the utmost. He has also been making great improvement in his flock of sheep by careful and judicious selection of his male and female animals; he is of opinion that the best way to get first-rate stock is to improve the native breeds by proper selection, treatment, and feeding, in which opinion there is much sound judgment and sense. *Mr. Love, in Journal of the Agricultural Society of England.*

Miscellaneous.

Experiments with Wheat.—Mr. Pawlett, of Biggleswade, has for many years been in the habit of comparing the productiveness of different kinds of Wheat. The following is his experience for the past season, as published in the columns of *Bell's Messenger*:—Having for the last few years given an account of the various trials which I had made on the productive properties of different varieties of Wheat, I again offer to the notice of your readers a statement of my experiments for the present season. Experiment No. 1.—The three following sorts of white Wheat were drilled separately (October 12), on lands which had previously borne a good crop of White Clover, at the rate of about seven pecks of seed per acre, at 8-inch intervals. The result I found as follows:—

No.	Quantity per acre. Bsh.	Pk.	Gal.	Value per qr. s.	Value per acre £	s.	d.
1. American, white	44	1	1	86	23	17	0
2. Grace's, white	52	2	0	85	27	17	9
3. Imperial, white	47	3	0	86	25	13	4

Experiment No. 2.—The following sorts of Wheat were drilled at 8-inch intervals (October 17, 1854), on a different part of the farm to those named in Experiment No. 1, on land in a high state of cultivation, and only 6 pecks of seed per acre was allowed. They were all put in on lands contiguous, and produced the following result:—

No.	Quantity per acre. Bsh.	Pk.	Gal.	Value per qr. s.	Value per acre £	s.	d.
1. Improved Browick, red	50	1	0	79	24	15	10
2. Uxbridge, white	47	0	1	86	25	6	7
3. Grace's, white	52	2	0	85	27	17	9
4. Imperial, white	47	0	1	86	25	6	7
5. Grace's, white, as No. 3	52	1	0	85	27	15	2
6. American, white	45	3	1	86	24	13	8
7. Brown straw, white	43	2	0	85	23	2	3

Experiment No. 3.—On the same day as the above experiment No. 2, and on the same sort of land, the following varieties of Wheat were drilled, also with 7 pecks of seed per acre, in rows at 8 inches asunder, on lands adjoining. Result:—

No.	Quantity per acre. Bsh.	Pk.	Gal.	Value per qr. s.	Value per acre £	s.	d.
1. Spalding, red	47	3	0	79	23	11	7
2. Albert, red	46	0	1	79	22	15	5
3. Improved Browick, red	50	2	0	79	24	18	4
4. Lammas, red	47	1	1	80	23	13	9
5. Prima Donna, red	42	3	1	78	20	18	0

An advertisement appeared in *Bell's Messenger* last autumn of a new variety of Wheat, called the Ne Plus Ultra, and being as usual anxious to prove a new sort, I procured 2 bushels of it only, as the price was rather high, it having cost me, including carriage, 2*l.* 9*s.* This sort was drilled by the side of the improved Browick in the middle of October, 1854, on a good piece of land, at 8-inch intervals as usual, and at the rate of about 7 pecks of seed per acre. Both sorts came up and planted well, but the Browick was ripe and fit to cut a fortnight before the Ne Plus Ultra. The weather, however, having continued fine, both sorts were harvested in excellent order. The result, when threshed, was as under:—

No.	Quantity per acre. Bsh.	Pk.	Gal.	Value per qr. s.	Value per acre £	s.	d
1. Ne Plus Ultra	47	0	0	68	19	19	6
2. Improved Browick	45	1	0	78	22	1	2

The quality of the Ne Plus Ultra Wheat was very coarse, and I think not worth so much, at the present value of Wheat, to the miller by 10*s.* per quarter as the general runs of Red Wheat. I believe that I should have some difficulty in disposing of it at the reduced price which I have given above. It may be remarked that I do not give the weight per acre of the different kinds of Wheat. My practice is, when I dress up, to weigh the whole quantity grown on each plot of land (and not measure it), then reduce it into bushels per acre of 63 lbs. each net, which is, I consider, the fairest and best way. By referring to the statements I have given, it will be seen that it is necessary to cultivate the most productive sorts of Wheat. By attending to this, and farming on a very excellent soil, accounts for the large produce of Wheat which I have again this year. *T. E. Pawlett, Beeston, Biggleswade.* [Mr. Pawlett has the credit of having for many years given attention to the selection of sorts of seed Wheat, and some of those named in the above list have retained their character for a considerable period. The Browick red appears to have proved itself for some time past a productive sort. Red Wheats have furnished several varieties lately of excellence, while new sorts of white have been rarer.]

Calendar of Operations.

OCTOBER.

Berwickshire Merse Farm, *Oct.* 13.—The great bulk of our harvest was finished three weeks ago, with the exception of some late Wheat which we carried a week later. One peculiarity has been noticed in this season, that there has been less difference than usual between the early and the late districts; thus our Lothian neighbours were engaged at the same time as we in securing their spring Wheat and Beans, though their low sea coast makes their climate a fortnight earlier in general. Beans are not a regular crop with us, as they seldom ripen properly unless allowed to stand till a precarious period of the season. The weather of August was unusually rainy, but it cleared up opportunely for our commencement, and after the 25th we lost half a day only, and finished harvest, with the before-mentioned exceptions, in four weeks from that day. Though the weather is now soft and showery, all the rain that has fallen has not penetrated to any depth, and our water-mills have as yet done very little work, consequently we have little idea as to how the straw will yield. If we may judge from the little we have done, and from the talk of our neighbours who have steam power, the results indicate about an average quantity of grain, but a very decided inferiority both of quality and condition. The latter defect will disappear through the winter, but with it will also disappear a large bulk of grain, which will reduce the crop to considerably below an average yield of well conditioned grain. The following table will show the condition as indicated by the weights of this crop as compared with last year's at the same period:—

	1854 lbs.	1855 lbs.
Wheat per bushel	63	60 to 61
Barley ditto	56	53 to 54
Oats ditto	43	40

The young Grass was scarcely visible at reaping, having been nearly choked by the laid state of the corn; but it is now pretty well planted, although not so regular as last year, and affords a good bite for the lambs (hogs). The Turnip crop has suffered severely from finger and toe on some farms, even to the extent of total failure, where drainage or lime are wanting. But on all

our break, which has been newly limed, there is not a diseased root. One or two instances of failure on recently dressed land are found, on investigation, to arise from the wet condition of the lime when applied. The first result of this failure, which showed itself just before harvest, was the depreciation of lean sheep to the extent of 5*s.* a head. Cattle were not similarly affected, perhaps because farmers must have beasts to put down their straw, and therefore any diminution of stock must come off the sheep. Fat sheep have been on Turnips three weeks, and improve rapidly; the hogs we hope will require few before the 1st of November, for Turnips are not too plentiful, and command high prices. Good steers (about half-fat) are thriving capitally on Turnips laid down on a lea field, and will not be housed so long as this mild weather continues. Our Turnips were threatened with an attack of mildew after the long drought of harvest, but the timely advent of showery weather has set at rest all fears on that score; the roots are sound, but not yet ready for storing. *J. T.*

South Devon, *October* 8.—The heavy rains we have had for some days past are proving most beneficial to the growth of the root crops, which were in a completely stagnant state, and in many cases past recovery; in short, it is much to be feared that, generally speaking, the remedy is come too late, and a preponderance of leaves over roots will be the result. The Potato crop is now being secured, and forms at present an important item in field operations: that the crop will be a very inferior one there can be but little doubt; we do not, however, hear as much of the disease as one would expect—the fact of its being no longer a novelty being probably the reason. The Apple crop is beginning to claim its share of attention, and women may now be seen collecting the early fallen fruit into heaps prior to pounding; the crop is a very partial one, and, generally speaking, may be considered below a half bearing. The accounts of the late harvest are far from satisfactory, both as to yield and quality—more particularly the Barley crop: and we fear good malting samples will be scarce. Our supplies of fat cattle are getting more abundant, and cause a reduction of prices. Store cattle are not in demand, the doubtful state of the root crops having rendered buyers cautious; this has been particularly felt at the numerous sales by auction of cattle during the past month. Our prices at present may be quoted as follows:—Fat beef, 60*s.* per cwt.; mutton, 6*d.* per lb.; old Wheat, 80*s.* per qr.; new Wheat, 76*s.* per qr.; Barley, 40*s.* per qr.; Oats, 24*s.* per qr.; wool, 8½*d.* per lb.; and Potatoes, 7*s.* per bag of 140 lbs.

West Sussex, *Oct.* 16.—Since our last report we have had some heavy rains, which came in good time to soften the lea ground for the plough, and now it turns up well; but the heavy wet lands must be let alone for a little time. Often impatience does mischief in them that a whole year will not rectify. There is not much Wheat sown yet, but all are on the look out so soon as the harrows can go: and here let us notice the method of preparing the seed Wheat, as that has been much discussed in your Paper this year. The plan I adopt is one for which I was indebted to your columns some 10 years ago, and which I may surely conclude to be perfect, for I have not seen one smutty ear after it all that time. But for the preventive:—Take three quarters of a lb. of blue vitriol, and dissolve it in about two gallons of cold water, or if you want to sow the Wheat at once, rather less water will do; take then a sack of Wheat and lay it upon any smooth floor where it can be taken up again, then sprinkle the solution over it with a bundle of straw tied tightly up (a water-pot will do it best, but it will not last one season, as the vitriol soon corrodes it through, as I have found): let the master do this, and have an assistant to turn it over quickly at least three times, the solution being all used with the second turning; then by the time the Wheat is taken up and carried to the field in some empty manure bags, it will be ready to sow by hand or drill. It will be found that two gallons of cold water will not dissolve all the vitriol, but I use a little hot water with it if convenient, or else put 1 lb. vitriol to the sack, reckoning that one quarter of it will not dissolve, so that it stands by till next time; of course, any quantity may be done at once, using the same proportions, and 1 lb. to the sack will do no harm. We cannot report very favourably of the Turnip crop; the rains came too late for them, and the late ones will be very small, and in some places they are very much eaten by the caterpillar. The gardens are almost stripped of vegetation, and the case seems worse further westward. There has been a good deal of Wheat threshed out, but still our market is not over supplied. We have had to pay dearer for our sheep this year by 4*s.* or 6*s.* a head, and the price of mutton must continue high before we can do well by them. Last year we had the market very favourable both ways. Cattle are dear, both fat and lean. The fat are not of first-rate quality; the high prices bring them into market before they are hardly fit. *G. S.*

Notices to Correspondents.

Giant Sainfoin: *E C.* It is to be sown and treated just as the common kind. April is a proper seed-time. More next week.

The Black Ant: *A Correspondent* asks for an effectual means of ridding the African or black ant from premises which have been long infested with them.

Pig Food: *Suffolk.* It will not be profitable to buy Potatoes for pig food at 6*s.* a sack. Pigs should receive mashed up with whatever steamed food is given to them from 4 to 8 lbs. of Barley meal each day, according to their size and consequent appetite.

To Salt or Pickle Bacon: *Forres.* As soon as the bacon comes from the butcher's hands it should have a covering of salt, dried and rolled to a fine powder, well rubbed in with the hand to every part, using the finger to fill every hole and joint, as it is most important that the meat should take the salt when quite fresh. In 12 hours all the brine and damp salt not absorbed should be scraped off the bacon and removed from the vessel, and dry salt added again as much as needed to cover it as before and well rubbed in. This process should be repeated every 12 hours for three days, when saltpetre should be added, getting off previously all the damp salt and brine as before, and applying the saltpetre as the common salt, adding a handful of the latter. A quarter of a pound of saltpetre to a side of bacon weighing 70 lbs. is sufficient; then mix 1 lb. of coarse brown sugar and 1 lb. of treacle, and pour over the saltpetre on the bacon, adding a little more common salt daily for three days, which serves to make the pickle keep well, and the whole liquor should be laded with a teacup over the bacon as often as convenient, four times a day for the first two weeks after it was first put to the bacon, and then never less than twice a day for the remainder of the time needed for its pickling, which is four weeks, or longer if larger bacon; and then it should be sent to the drying-house and smoked over wood fire. ——Tegetmeier's essay has not been published in a separate form that we are aware of.

Turnip Grating. We should be glad of information on this subject from any person who has had experience. A Correspondent writes to us as follows:—"In this part of the country hay is very scarce, and cattle must be fed more than ever with straw and chaff; it is, therefore, a great object to know how to make them most economically palatable and nutritious. I think, therefore, it would confer a benefit on the public if some of your correspondents would give the results of their experience in answer to questions of the following sort:—What implements or vessels are required for producing the fermented food? What time must be ordinarily allowed for the fermentation? (In frost?) May it be given in unlimited quantity? What points require particularly to be attended to? What particular benefit may be expected from the practice? I should be glad also to know whether it would be practicable and advantageous to convey the fermented food from the homestead to feed animals in a yard a short distance off, or to give it to sheep folded on outlying land.

On the 31st October will be published, in handsome Folio, price 6s., Part VIII. of

THE FERNS OF GREAT BRITAIN,

NATURE-PRINTED (LIFE SIZE).

LIQUID MANURE.

PATENT LIQUID-MANURE DISTRIBUTOR OR WATER-CART, for the Distribution of Guano, &c., warranted not to clog up or otherwise get out of order. It has Waterproof Joints, and will scatter its Liquid from 12 to 15 feet wide. It will work equally well on hilly or on level land without any alteration. It is thoroughly adapted for Drill Crops or Pasture Land, or for Watering Streets.—Full particulars may be obtained of the Patentee, ISAAC JAMES, Tivoli, Cheltenham.

WARNER'S 4½-inch IMPROVED LIQUID MANURE PUMP, with Ball Valve, fitted with 1¼ inch Brass Union for attaching flexible suction, with strong wrought iron Straps for screwing on to any ordinary Water-butt or Cart, as shown in drawing.

Price of Pump and Union, 50*s.*

1¼-inch Flexible Rubber and Canvas Suction for ditto, 3*s.* 6*d.* per foot.

1¼ Gutta Percha Suction, 1*s.* 6*d.* per foot.

WARNER'S PATENT VIBRATING STANDARD PUMPS.

PATENT CAST-IRON PUMPS, for the use of Farms, Cottages, Manure Tanks, and Wells of a depth not exceeding 30 feet.

Diameter of Barrel.	Length of Barrel.		£	s.	d.
2½ in. short	1 ft. 7 in.	Fitted for lead,	1	12	0
2½ „ long	3 „ 3 „	gutta percha,	1	15	0
3 „ ditto	3 „ 6 „	or cast iron	2	12	0
3½ „ ditto	3 „ 6 „	flanged pipe,	2	18	0
4 „ ditto	3 „ 6 „	as required.	3	5	0
2½ „ short, with 15 feet of Lead Pipe attached, and Bolts and Nuts ready for fixing			2	12	0
2½ in. long	ditto	ditto ditto	2	15	0

The short barrel Pump is very convenient for fixing in situations of limited height and space, for the supply of coppers and sinks in Wash-houses with soft water from underground tanks, or in Hot, Forcing, and Plant Houses; they may be fixed, when desired, under the stage.

May be obtained of any Ironmonger or Plumber in Town or Country, at the above prices, or of the Patentees and Manufacturers, JOHN WARNER AND SONS, 8, Crescent, Jewin Street, London.

Every description of Machinery for Raising Water by means of Wheels, Rams, Deep Well Pumps, &c.; also Fire and Garden Engines, &c. &c.—Engravings sent on application.

PARKES' STEEL DIGGING FORKS & DRAINING TOOLS.

MESSRS. BURGESS AND KEY, as Mr. PARKES' Wholesale Agents for England, have always in stock a large assortment. These Forks and Tools are now in use by upwards of 1000 of the Nobility and Farmers, members of the Royal Agricultural Society, who pronounce them to be the best ever invented, and to facilitate labour at least 20 per cent. Price Lists sent free on application, and Illustrated Catalogue of the best Farm Implements, on receipt of eight postage stamps.
108, Newgate Street, London.

FRENCH MODERATOR LAMPS.—A very large and superior stock now on sale at DEANE, DRAY, AND CO.'S (Opening to the Monument), London Bridge.
Established A.D. 1700.

METCALFE AND CO.'S NEW PATTERN TOOTH BRUSH, PENETRATING HAIR BRUSHES, AND SMYRNA SPONGES.—The Tooth Brush performs the highly-important office of searching thoroughly into the divisions and cleansing in the most extraordinary manner—hairs never come loose. Peculiarly penetrating Hair Brushes, with durable unbleached Russian bristles, which will not soften like common hair, and immense stock of genuine unbleached Smyrna Sponge, with every description of British and Foreign Perfumery, at METCALFE, BINGLEY, & Co.'s only Establishment, 130 B and 131, Oxford Street, second and third doors west from Holles Street.

CAUTION.—Beware of the word "from" Metcalfe's, adopted by some houses. Metcalfe's Alkaline Tooth Powder, 2*s.* per box.

OAT-CRUSHING AND BEAN-SPLITTING MILL (TURNER'S No. 5).

This Mill is recommended to the use of every person keeping a Horse, as superior for efficiency, durability, and ease in working to any manufactured. Two bshls. of crushed corn afford more nourishment both to old and young horses than three bushels of uncrushed!

Price £5 15*s.* 6*d.*

Made and Sold by
E. R. & F. TURNER, St. Peter's Iron Works, Ipswich.

BALUSTRADING FOR GARDEN TERRACES, executed in Austin's Artificial Stone, by J. SEELEY (late Austin and Seeley), Nos. 1 to 4, Keppel Row, New Road.

N.B. This work is truly of the same constitution as Portland Stone, and after a winter's exposure is hardly distinguishable from that material: it has been extensively used in Scotland for more than 20 years.

DRAINAGE OF LAND, BOGS, ETC.

MR. HUMBERT, of Watford, Herts, supported by unquestionable references and testimonials, offers his services to proprietors about to execute works of drainage, which he will undertake personally to lay out and superintend, and to supply the forms and attendances necessary to obtain the certificate of the Inclosure Commissioners at a fixed price per acre. Mr. Humbert (having been more than 15 years established in business as a Surveyor and Land Agent) has found that wet heavy soils can be usually carefully and thoroughly drained, with pipes 4 feet deep, and upwards, at from 4*l.* to 5*l.* per acre, inclusive of every expense.

PURE WHITE DORKING CHICKENS.

TO BE SOLD, a few choice BIRDS, at 10*s.* each, crate included.—Apply to Mr. HORNE, Egham, Surrey.
